Archives

London :

**PUBLISHED BY THE PROPRIETORS,
AT 4, LUDGATE HILL, E.C. 4.**

K

INDEX.

List of sub-headings:—AUTHORS, BANKRUPTCY PROCEEDINGS, CITY NOTES, CONTRACTS CLOSED AND OPEN, CORRESPONDENCE, INSTITUTION AND LECTURE NOTES, LEGAL, LIGHTING AND POWER NOTES, LIQUIDATIONS, NEW COMPANIES, NEW ELECTRICAL DEVICES, FITTINGS AND PLANT, OBITUARY, OFFICIAL RETURNS, PROSPECTUSES, RAILWAY NOTES, REVIEWS, TELEGRAPH NOTES, TELEPHONE NOTES, TRAMWAY NOTES, WAR ITEMS.

ABBOIT insulating cloth, 493

Accidents, 72

Accidents in the U.S., Steam turbine, 569.

Advertising, Commonsense in, by A. J. Hough, 379

Aeroplanes, Wireless transmitting stations on German, 607

A.E.G., The, 616

After-the-war electrical problems in Russia, 317

After war trade, Germany and raw materials for, 305

Agriculture, Electricity in, 21, 425, 472

Agriculture, The engineer and, 434, 439

Air blast rectification of high tension currents, 101

Air Inventions Committee, An, 592

Aircraft, Communication with, 616

Air raid warning, 88

Alliance of employers and employed, 473

Alternating current traction motors, Notes on, 196

Aluminium resources of the Empire, 14

Amalgamated Society of Engineers, The, 64, 281, 375, 569

American electric railways, Power sources of, 233

American loan issue, A large, 186

American war loan, 40,000 electrical employés subscribe to the, 29

America's export trade in electrical goods, by M. Chalmers, 413

Anchor Hospital and Distress Fund, 185

Anglo-Italian Trade, 563

Announcer at Dutch Auctions, Electric, 159

Appointments vacant, 40, 65, 90, 112, 136, 160, 186, 210, 232, 257, 282, 305, 329, 353, 377, 401, 424, 446, 473, 496, 521, 543, 569, 593, 617

Apprentices for the electrical trades, Training, 281, 377

Apprenticeship, Terms of, 15

Arc lamps and incandescent lamps, Modern, 531, 556

Arcs for bioscope, Steady, 520

Argentine Republic, 563

Arms, Mechanical, 374

Artificially loading hydro-electric generators on test, 24

Association movement, The, 313

Association movement, The, by H. H. Berry, 344

Association of Electrical Station Engineers, 352, 377, 401, 425

Atmospheric nitrogen, The fixation of, 340, 365, 387

Australia, British and American electrical trade with, 406

Australia, Electrical rain-making in, 295, 447, 520

Australia, Japanese electrical deputation to, 467

Australia, Super-tax on British trade with, 348

Australian brown coal deposits, 137

Australian Bureau of Science, 153

Australian electric steel, 519

Australian Metal Co. and the A.E.G., 377

Australian scheme, Empire trade organisation, 447

Australian strike, The, 354

Australian tramway men, Wages of: arbitration, 448

Austria, Drawn wire lamps in, 407

Austria's future export trade, 468

AUTHORS—

Arnold, A., on The psychology of power house shift work: An ex-shiftman's reflections, 69; on the Romance of electrical work, 508

Barham, G. Basil, on Justifiable industrial unrest, 607

Beaver, C. J., on V.B. cable breakdowns in the tropics, 237

Berry, H. H., on The association movement, 344

Blake, H. E., on Fault localisation by drop of potential, 172

Buyers, C. Stuart, on Insurance of electrical machinery, The, 580, 605

Chalmers, M., on Japan's progress in the electrical industry, 124; on American export trade in electrical goods, 413

Chitty, A. V., on Reinforced concrete poles for transmission cables, 608

Crowley, J. F., on The production and distribution of power, and its influence on the development of Irish industry, 174

"Commercial," on The state of trade, 503

Dalrymple, J., on The rule of the footpath, 298

Ellerdy-Stykes, W., on Some practical experiences with tough rubber compound cables, 291

Ellis, A. G., on Some notes on British and Continental engineering methods and training, 213

Gillott, W. A., on Electrical cooking as applied to large kitchens, 597, 621

Hering, C., on An enlarged electron of practical size—The Faraday, 8

Holford, G. W., on Tramway finance, 297

Holt, A. O., on The future of the electrical industry, 460

Hough, A. J., on Commonsense in advertising, 379

Hunter, T. M., on Gas-firing boilers, 509, 549, 573, 609

Hutchison, D. M. W., on V.R. cable breakdowns in the tropics, 172

Kaye, Capt. G. W. C., on X-rays after the war, 525

Kelley, F. C., on Permanent magnets, 166

Kennedy, D. Ross, on Engineering publicity, 243; on Research organisation, 435

Lawson, A. J., on London County Council tramway results, 149

Lindstrom, Prof. A., on Leads for electric furnaces, 56

Lyons, W. V., on Determining phase rotation, 71

Milburn, R. L., on A long-distance duplex-working central battery system, 460

Murgatroyd, F., on The examination of commutation conditions in interpole machines, 173

AUTHORS—continued

Pausey, E. B., on Coal stack fire risks, 603

Poole, E., on Union of South Africa municipal electrical undertakings, 320, 357

Porter, G., on Tar oil fuel and Diesel engines, 30, 105

Priestley, J. A., on Electric vehicles in Sheffield, 55, 118

"Pulveriser," on Diesel engines and the war, 549

"Radix," on The education and training of engineers, 507, 532, 555, 562

Raine, Councillor C., on The development of tramways, 298

"Research," on A good summer load, 76

Reuss, E., on Electrolysers and their management, 75

Roberts, C. H., on Water supplies as sources of power, 560

Roberts, J., Presidential address to the Association of Municipal Electrical Engineers (Union of South Africa), 437

Robertson, J. A., on Fuel economy, 5

"Rover," on Should the chief concern himself with detail, 525

Russell, H. R., on Automatic control of blast pressure for Diesel engines, 463

Sankey, Capt. H. Riall, on Heat Engines, 560

Scott, E. K., on Electric steel furnaces, 45; on Manufacture of synthetic nitrates by electric power, 93; on The manufacture of nitrate of ammonia by electric power at coke oven plants, 238

Smith, E. W., on Electric power generation by gas, 95

Stubbings, G. W., on Errors of registration of electricity meters with varying loads, 4; on Some notes on diving bell covers for disconnecting boxes, 123; on Some notes on staff organisation in electricity works, 150; on Some suggestions for the prevention of mistakes in meter reading, 267; on Some curiosities of early mains work, 293; on An approximate method of checking the accuracy of a direct reading insulation testing set, 315; on Office organisation in municipal electricity undertakings, 462; on Salaries of central-station officials, 484

"Tramp Royal," on Specialising and specialists, 315

Tucker, S. A., on A granular carbon electric furnace, 143

"W. A. E. M.," on Direct-current machines: Some notes on estimating, 165; on Direct-current balancers, 292

Wans, O., on The working costs of the principal prime movers, 391

Welbourn, B., on The properties of electrolytic copper: Modulus of elasticity, 587

Weston, P. L., on A magnetic steel band drive, 383

AUTHORS—continued

Wilson, W. J., on Water heating by electricity, 567

Wood, T. H., on The theoretical consideration of the ventilation of sub-stations and transformer houses, 51

Wordingham, C. H., Presidential address to the Institution of Electrical Engineers, 478, 501, 527

Wright, C. H., on Electrostatic voltmeters, 413

Young, A. P., on The high-tension magneto, 310, 333, 381, 405, 429

Automatic control of blast pressure for Diesel engines, by H. S. Russell, 463

Aviation, Electricity in, 397

Award, Electrical wages, 20

Award of the Committee of Production, Engineers, 135, 568

BALANCER used for testing purposes, 195

Balancers, Direct current, by "W. A. E. M.," 292

Bank for industry, Indian, 473

Bank, Proposed industrial, 612

Banking, Chambers of Commerce and, 257

BANKRUPTCY PROCEEDINGS—

Brown, F., 156, 325

Connold, R. E., 421

Coster, S. S., 445, 563

Felgate, A. E., 421

Ogilvie, C. B., 36, 181

Oxley, H. H., 300

Parfitt, G. J. T. J., 156, 232

Parsons, W., 252

Peddie, J. T., 131

Barcelona University, Electrical instruction at, 424

Battery ignition for petrol motor vehicles, Magneto v., 383

Battery manufacture, Storage, 443

Beds, Electrically-heated, 594

Belfast strike, The, 256, 306, 434, 567

Bells, Underground signalling, 94

Bequest for research, 112

Benevolent Institution, Electrical Trades, 567

Bioscopes, Steady arcs for, 520

Birmingham Corporation electrical employees, 567, 591

Blast pressure for Diesel engines, Automatic control of, by H. S. Russell, 463

Board of Trade, Commercial intelligence work of the, 60, 185, 219, 257, 348

Board of Trade Committee on Electricity Supply, 15, 39, 50, 89, 112

Board of Trade Electricity Committee, Scottish local authorities and, 473

Board of Trade urges British manufacturers to combine, 281

Boat, An electric war, 439, 473

Boilers, Gas firing, by T. M. Hunter, 509, 549, 573, 609

Books for British prisoners of war, 184, 568

Brains, Workmen's, 591

Brake, Electric loom, 136
 Brazil, 220
 Brazil, Trade with, 348, 515
 Breakdowns in the tropics, V.B. cable, by D. M. W. Hutchison, 172; by C. J. Beaver, 237
 British and Continental engineering methods and training, Some notes on, by A. G. Ellis, 213
 British Association, 41, 68
 British Dyes, 401
 British Electrical and Allied Manufacturers' Association membership, Additions to, 40
 British Engineers' Association, The, 134
 British Engineering Standard Committee and Anglo-American co-operation, 346
 British export trade, New co-operative scheme to develop, 562
 British Ignition Apparatus Association, 282
 British Industries Fair, 491
 British Industries, Federation of, 393
 Brook, Ltd., Huddersfield, The "Empress" Works of Messrs. F., 339
 Brougham test, American electric, 137
 Budapest without light, 569
 Buyers—Beware! 64

CABLE breakdowns in the tropics, V.B., by D. M. W. Hutchison, 172; by C. J. Beaver, 237
 Cable factory, New German, 468
 Cable telegraphy, Multiplexing in, 165
 Cables, Copper for, 256
 Cables, Some practical experiences with tough rubber compound, by W. Ellard-Stiles, 291
 Calcium carbide, Ministry of Munitions order, 304
 Camp equipment, United States training, 144
 Canada, Notes from, 558, 586
 Canada, Swedish trade in, 12
 Canada, Trade with, 157, 159, 342
 Canada, U.S. electrical exports to, 253
 Canadian electric cooking notes, 142
 Canada's coal supply, 68
 Canal, Forth and Clyde ship, 160
 Canal transport, 282
 Canoes, Electric, 250
 Canteen, An electrical, 305
 Car, The one man light-weight safety, 506
 Carbon electric furnace, A granular, by S. A. Tucker, 143
 Carbon electrode furnace, A new U.S., 135
 Carbon factory, New Norwegian, 456
 Cardiff electrical dispute, 136
 Cast iron as a bearing metal, 280
 C.A.V., new electric starter, 305
 Celluloid, The effect of heat on, 616
 Central battery system, A long-distance duplex-working, by R. P. Milburn, 461
 Central station employees, St. Pancras proposals, 400
 Central station officials, Wages of, by G. W. Stubblings, 484
 Central stations, Supplies for German, 404
 Central station workers, The wages of, 289, 303
 Channel tunnel, The, 120, 183
 Charing Cross Hospital, The temperature control system in the, 440
 Charlottenburg in 1916, Electrical work at the Physikisch-technische Reichsanstalt, 391
 Chelmsford, Charity sports at, 209
 Cheshire, Water power proposals, 2
 China clay combination, 420
 China, Electrical trade in, 261
 China, Engineering in, 402
 China, Japanese electrical exports to, 60
 Christmas, The spirit of this, 577

CITY NOTES—

Adelaide Electric Supply Co., 547, 571
 Allgemeine Elektrizitäts Gesellschaft, 403, 546
 Aluminium Corporation, 19
 Amalgamated Wireless (Australasia), 451
 Amazon Telegraph Co., 499, 546
 Anderson Foundry Co., 428
 Anglo-American Telegraph Co., 91, 403
 Anglo-Argentine Tramway Co., 595
 Anglo-Portuguese Telephone Co., 379
 Auckland Electric Tramways Co., 476, 523
 Austrian companies, 115
 Automatic Telephone Manufacturing Co., 526
 Automatic Telephones (Australasia), 331
 Avery, W. & T., 67, 620
 Babcock & Wilcox, 403
 Barbados Electric Supply Corporation, 571
 Barcelona Traction, Light & Power Co., 451
 Blackpool & Fleetwood Tramroad Co., 168
 Blackpool, St. Anne's & Lytham Tramways Co., 620
 Bogota Telephone Co., 523
 Brazilian Traction, Light & Power Co., 67, 245, 547

CITY NOTES—continued.

Brisbane Electric Tramways Investment Co., 379
 British Aluminium Co., 284
 British Columbia Electric Railway Co., 19
 British Electric Traction Co., 524
 British Electric Transformer Co., 331
 British Ever-Ready Co., 499
 British Insulated & Helsby Cables, 284
 British Thomson-Houston Co., 67, 91, 114
 Bristol Tramways & Carriage Co., 115
 British Vacuum Cleaner Co., 572
 British Westinghouse Electric and Manufacturing Co., 595
 Bromley (Kent) Electric Light & Power Co., 259
 Brompton & Kensington Electricity Supply Co., 163
 Brotherton Tubes and Conduits, 259
 Browett, Lindley & Co., 19
 Bournemouth & Poole Electricity Supply Co., 91
 Calcutta Electric Supply Corporation, 140, 188, 307, 428, 499, 571
 Calcutta Tramways Co., 355, 379
 Callender's Cable & Construction Co., 331
 Callender's Share & Investment Co., 499
 Canadian General Electric Co., 236, 772
 Cape Electric Tramways, 499, 547, 571
 Cape Town Consolidated Tramways and Land Co., 259
 Castner-Kellner Alkali Co., 499, 523
 Central London Railway Co., 92
 Charing Cross, West End & City Electricity Supply Co., 115
 Chile Telephone Co., 43
 Chloride Electrical Storage Co., 259, 499
 City & South London Railway Co., 92
 City of Buenos Aires Tramways Co. (1904), 91
 City of London Electric Lighting Co., 235
 Claud Hamilton, 403
 Clevedon, Portishead & District Electric Supply Co., 91
 Clyde Valley Electrical Power Co., 235
 Coalite, 499
 Compagnie Française des Cables Télégraphiques, 450
 Companies struck off the register, 547, 595
 Companies to be struck off the register, 211, 259, 307, 332, 355
 Consolidated Electrical Co., 19, 139
 Costa Rica Electric Light & Traction Co., 620
 County of Dorset Electric Supply Co., 283
 County of London Electric Supply Co., 211
 Coventry Chain Co., 572
 Credenda Conduits Co., 428
 Crompton & Co., 91, 138
 Crossley Bros., 167
 Cuba Submarine Telegraph Co., 355
 Davis & Timmins, 235
 Dick, Kerr & Co., 403, 427
 Direct Spanish Telegraph Co., 284
 Direct United States Cable Co., 43, 355
 Direct West India Cable Co., 392
 Drake & Gorham, 427, 475
 Dublin United (Electric) Tramways, 44
 Dublin United Tramways (1896), 43
 Dumbarton Burgh & County Tramways Co., 259
 East London Railway Co., 572
 Eastern Extension, Australia & China Telegraph Co., 91, 284, 379, 427, 595
 Eastern Telegraph Co., 284, 379, 427, 571
 Edison & Swan United Electric Co., 571, 619
 Edmundson's Electricity Corporation, 43
 Electric & General Investment Co., 43
 Electric Construction Co., 499
 Electric Supply Co. of Victoria, 379
 Electrical Securities Trust, 524
 Electrical Utilities, 91
 Electro-Bleach & By-Products, 187
 Erindale, 403
 Escher, Wyss & Co., 355
 Fellows Magneto Co., 379
 Ferranti, 595
 Fife & Kinross Electric Supply Co., 259
 Fraser & Chalmers, 43, 331, 547, 595
 French Companies, 91, 115, 139, 187, 300, 491, 499, 515, 547, 599
 Gandy Belt Manufacturing Co., 259
 General Electric Co., 42, 66
 General Electric Co., U.S.A., 91
 German companies, 235, 306, 379, 498
 Glenboig Union Fireclay Co., 355
 Globe Telegraph and Trust Co., 244, 547
 Greenwood & Batley, 91
 Guildford Electricity Supply Co., 188
 Halfords, 67
 Halifax and Bermuda Cable Co., 331
 Harris, J. F. & G., 572

CITY NOTES—continued.

Havana Electric Railway, Light, & Power Co., 43
 Henley's Telegraph Works Co., W. T., 163
 Hong Kong Tramway Co., 115
 Hornsby, R., & Sons, 523
 Hungary, 572
 Hurst, Nelson, & Co., 428
 India-Rubber, Gutta-Percha & Telegraph Works Co., 571, 618
 Indian Electric Supply & Traction Co., 451
 Indo-European Telegraph Co., 114, 355
 International Light & Power Co., 427
 Isle of Wight Electric Light & Power Co., 451
 Italian Companies, 491, 563
 Kalgoolie Electric Tramways, 162, 331
 Kaministiquia Power Co., 67, 91, 379
 Kensington & Knightsbridge Electric Lighting Co., 140
 Lancashire Dynamo & Motor Co., 163, 380
 Lancashire Power Construction Co., 67
 Lima Light, Power & Tramways Co., 67, 379
 Liverpool Overhead Railway Co., 91
 London & Suburban Traction Co., 115
 London Electric Railway Co., 92
 London United Tramways, 114
 Madras Electric Tramways, 235
 Manila Electric Railroad & Lighting Corporation, 284, 595
 Manassas Tramways & Light Co., 331
 Manx Electric Railway Co., 571
 Marconi International Marine Communication Co., 42, 236, 331
 Marconi Wireless Telegraph Co., 114, 162, 620
 Marconi Wireless Telegraph Co. of Canada, 354
 Mather & Platt, 67
 Melbourne Electric Supply Co., 547
 Metropolitan District Railway Co., 92
 Metropolitan Electric Supply Co., 67
 Metropolitan Railway Co., 115
 Monte Video Telephone Co., 451, 498
 Montreal Light, Heat & Power Co., 379
 Montreal Tramways Co., 140, 332
 Nairobi Electric Power & Lighting Co., 67, 476
 National Gas Engine Co., 115
 National Telegrapher Co., 380
 Newcastle-upon-Tyne Electric Supply Co., 235
 New issue, 67
 North London Railway, 115
 North Metropolitan Electric Power Supply Co., 403
 North Melbourne Electric Tramways and Lighting Co., 91
 Northampton Electric Light & Power Co., 523
 Norwich Electric Tramways Co., 451
 Oldham Ashton & Hyde Electric Tramways, 163
 Oriental Telephone & Electric Co., 355
 Oxford Electric Co., 211
 Paris Metropolitan Railway, 43
 Parsons Marine Steam Turbine Co., 380
 Pernambuco Tramways & Power Co., 114
 Pollock & Macnab, 547
 Power Gas Corporation, 523, 571
 Provincial Tramways Co., 547
 Quebec Railway, Light, Heat & Power Co., 476
 Rawlings Bros., 524
 Reddaway & Co., F., 595
 Reduction of capital, 188, 236
 Richardsons, Westgarth & Co., 618
 Rio de Janeiro Tramway, Light, & Power Co., 67, 355
 Ross Electric Light & Power Co., 571
 Royce, 355
 Russian companies, 115, 235, 259, 428
 Ruston, Proctor & Co., 523
 St. James' & Pall Mall Electric Light & Power Co., 67
 Sao Paulo Tramway, Light & Power Co., 43, 67, 355
 San Luis (Mexico) Tramways Co., 163
 Shanghai Electric Construction Co., 355
 Shawinigan Water & Power Co., 331
 Singapore Electric Tramways Co., 67
 South American Light & Power Co., 91
 South Brazilian Railways Co., 91
 South Metropolitan Electric Light & Power Co., 163
 Spain, 92, 139
 Spain & General Wireless Trust, 420
 Steward & Lloyds, 188
 Stock Exchange notices, 211, 238, 307, 331, 403, 499
 Stohert & Pitt, 475
 Swiss Brown Boveri Co., The, 139
 Swiss companies, 43, 331, 498
 Tata Hydro-Electric Power Supply Co., 547

CITY NOTES—continued.

Telegraph Construction & Maintenance Co., 19
 Trafford Park Estates, 476
 Tubes, 379
 Tudor Accumulator Co., 131
 Tyneside Tramways & Tramroads Co., 187, 235
 Underground Electric Railways Co., 92
 United Electric Tramways of Caracas, 476, 499
 United Electric Tramways of Monte Video, 18
 United River Plate Telephone Co., 380
 United Wire Works, 547
 Vera Cruz Electric Light, Power & Traction Co., 618
 Vickers, 140
 Victoria Falls & Transvaal Power Co., 258, 306, 428
 Waste Heat & Gas Electrical Generating Stations, 139
 West African Telegraph Co., 67
 West Coast of America Telegraph Co., 19
 West India & Panama Telegraph Co., 401
 Western Telegraph Co., 475, 547
 Westinghouse Brake Co., 425
 Westminster Electric Supply Corporation, 115
 Willans & Robinson, 140
 Winnipeg Electric Railway Co., 44
 Yorkshire Electric Power Co., 114
 Zurich Bank for Electrical Undertakings, 451

Civil Service, Science and the, 520
 Clearing house for railways, A goods, 521
 Coal and coke oven gas firing, Combined, 199
 Coal concreted from dust or ashes, 124
 Coal consumption and inter-connection of electricity works, Economy in, 15
 Coal deposits, Australian brown, 137
 Coal, Emergency storage of, 296
 Coal, Household, 304, 330
 Coal in bulk, Storage of, 448
 Coal mining, Electricity in, 575
 Coal prices, Regulation of, 15, 257
 Coal production, 294
 Coal saving electric plant, Russian grant, 304
 Coal shortage, Causes of German, 448
 Coal shortage in Switzerland, 352
 Coal stack fire risks, by E. B. Pausev, 603
 Coal supply, Canada's, 68
 Coal transport, Reorganisation scheme, 29
 Coal transport reorganisation scheme: Special fuel, B. of T., 64
 Coal wagons, 330
 Coal with an electric truck, Handling, 308
 Collieries, New South Wales, 432
 Colliery signalling patents, 519
 Combination, China clay, 420
 Combination, Iron and steel trade, 566
 Combination, The question of, 328
 Commercial Intelligence Service, 46, 185, 219, 257, 348
 Commercial treaties, 473
 Commissioners, Trade, 194
 Commutation conditions in interpole machines, The examination of, by F. Murgatroyd, 173
 Competition for electric cookers, 185
 Concrete poles for transmission cables, Reinforced, by A. V. Chitty, 609
 Conference of electrical engineers in India, 41
 Congress of Civil Engineers, 41
 Contract conditions, L.C.C. electrical, 589
 Contract, Damages on failure to complete a, 324

CONTRACTS CLOSED—
 Accrington, 328
 Aldershot, 38
 Australia, 87, 471
 Aylesbury, 303
 Barrow, 110, 328
 Basingstoke, 133
 Bath, 110, 374
 Bexhill-on-Sea, 328
 Bolton, 566
 Bradford, 255, 351, 428

It is announced that the Ministry of Labour has placed before the leading Associations of Employers and before the Trade Unions a number of proposals respecting the future relations of Capital and Labour. The proposals are the outcome of the investigations and study upon which a sub-committee of the Reconstruction Committee of the Government has been engaged for some time. The *personnel* of the Committee does not matter greatly, for the recommendations have to pass through the mill which is composed of the minds of authorities of practical experience on both sides, and it is upon the conclusions arrived at by these authorities that so much must depend. We are all in real earnest in our search for ways and means whereby in the new industrial situation that must inevitably follow the war, there shall be as near an approach to industrial peace as is possible in a human state of existence. We shall show our sincerity best by approaching all proposals that are authoritatively advanced with reason and with sympathy, and one of the first things that we have got to recognise is that the Government in war-time has given the workers, upon whom we have had to rely to furnish the wherewithal to wage successful warfare against a common foe, the most definite undertakings for the after-the-war period. These undertakings took the form of Government guarantees, sanctioned by Parliament, which, of course, represents all manufacturing industry concerned in the compact, whatever may be the likes or dislikes of individual firms or persons. All concerns that received the benefits of the temporary suspension of trade union provisions which made for limitation of output and other things of a like character dear to the heart of Labour, whether they will or no are bound by the guarantee.

The agreements thus arrived at have been adhered to during the war, but it was not foreseen how great would be the effects of the European upheaval upon all industrial conditions. It was not foreseen then that there would come a time when practically everybody would recognise, as the sub-committee suggests in its interim report is the case, that the war enforced some reconstruction of industry. That we shall not for perhaps a generation, if ever again, be able, even if we so desired, to return to the industrial state of affairs that obtained before the war is as certain as anything well can be in these moving times. We have, therefore, to look forward to a new period altogether, in which arrangements of all kinds made in the past will

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE:—4, LUDGATE HILL, LONDON, E.C. 4.

Telegraphic Address: "AGEEKAY, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 6d.; Canada, £1 3s. 10d. (\$5.80). To all other countries, £1 10s.

come under revision. The very guarantees which have been so definitely given will naturally be among the arrangements calling for attention. It is most necessary, as well as being desirable on other grounds besides that of sheer necessity, that there should be no ground for suspicion or apprehension on the part of Labour that the nation desires to avoid obligations that have been shouldered by its official representatives. We are unitedly fighting the most dishonourable foe that history has ever made infamous, and it is not likely to be the will of the nation to have any taint of dishonour besmirching its own record when it comes to settle the problems arising for settlement among ourselves. The question, then, arises how, in this period of industrial reconstruction, these coming days of new relationships, we can all work together so that the industrial well-being of the people shall be protected by industry being made prosperous, and so that, at the same time, Labour conditions shall be so revised as to make the position of the workers no less, and perhaps far more, satisfactory than it could possibly have been if they had been able to return to the state of affairs that existed before the Unions agreed to the suspension of the rules.

It is recognised by the Reconstruction Sub-Committee, in what is described as its Interim Report on Joint Standing Industrial Councils, that there must be the largest possible measure of co-operation between employers and employed; also that any proposal put forward for securing that end should offer to the workpeople the means of attaining improved conditions of employment and a higher standard of comfort generally. Such proposals should also involve "the enlistment of their active and continuous co-operation in the promotion of industry." In order to attain these ends it is necessary that each industry should have its own organisation, representative of its employers and workpeople, such organisation to have as its object the regular consideration of matters affecting the progress and well-being of the trade from the point of view of all those engaged in it, so far as this is consistent with the general interest of the community.

The principal recommendation of the sub-committee is that if, after the representatives of employers' associations and trade unions have considered the propositions, they approve of them so that Government may legislatively act in the same direction, Joint Standing Industrial Councils shall be set up in the several industries in which they do not already exist, composed of representatives of employers and employed. It is further suggested that in the well-organised industries local and works organisations may supplement and make more effective the work of the central bodies. There should be triple organisation—works, districts, and national. The various questions that the National Council should handle are detailed in the *Times* of June 29th, to which we refer our readers who have an interest in the matter, but have not officially received the interim report.

It is obvious that efficient and suitable organisation is the very first requirement of the situation. Many of the points covered in the report will come under discussion in the coming months, but this question of organisation, upon which we have so often and so emphatically dwelt in these pages, is essential in the earliest stage of our approaches toward permanent industrial peace. The efforts of the past year toward that end, including the establishment of the Alliance of Employers and Employed, will not have been wasted.

There is not the least room for doubt that if employers and employed are afforded better facilities for meeting and discussing industrial questions together, causes of friction may often be removed,

reducing materially the number of occasions on which it will be necessary, in the words of the committee, "to contemplate recourse to a stoppage of work." The necessity of providing some method of ensuring the due observance on both sides of agreements thus arrived at must not be overlooked.

The appearance of the report, in our opinion, is most timely, and the general tenor of its proposals is satisfactory. We hope that the employers' and unions' organisations which now have it before them will find it convenient to advance their criticisms and suggestions for the improvement of the scheme, wherever such may be necessary, without delay.

Cheshire Water-power Proposals.

Up to the present the water powers of this country have occupied a very secondary position in the public estimation; we have not, of course, any spectacular powers, judged by American standards, and, on the other hand, we have, or had, an abundant supply of cheap coal, both of which considerations have tended to obscure the fact that there are a good many low-head water powers possessing certain economic possibilities in this country, especially if the price of coal remains at a high level. In this connection, considerable interest attaches to the recent decision of the Chester Town Council to apply for a grant of £200 under the Development Fund Act of 1909, for the purpose of investigating the water-power possibilities of the River Dee above Chester, with a view to generating electricity to be used for agricultural purposes and for the development of rural industries.

It will be remembered that the Chester Corporation has now experienced the benefits of its own hydro-electric development, at the Chester Weir, for some 3½ years, the system of operation being such that electrical energy can be generated with a fall of 2 ft. or more, resulting in the production of 30 per cent. more energy than is usually obtained in developments of this nature. Up to March last some 5½ million units had been obtained from this plant at an average cost per unit of .0876d. for labour, repairs, &c., and .1483d. for interest and loan charges.

The inception and carrying out of the above project is to the credit of Mr. S. E. Britton, the city electrical engineer, who, in view of the success attending the original scheme, and the prospective advantages of an adequate supply of electricity to the thriving agricultural and rural communities of Cheshire, has now brought forward a proposal for the further development of the water power in the higher reaches of the river. It is considered that upwards of a dozen hydro-electric plants could be provided in 40 miles of river, and that some 10 million units per annum could be supplied to the adjacent farms and villages. Rough estimates based on the Chester scheme show that with operating costs at about ¼d. per unit generated, and an average income of 2d. per unit sold, the available surplus would allow of a capital expenditure far in excess of the probable cost of the works; moreover, such a development would utilise a natural source of energy now running to waste, and to produce the equivalent from coal would require some 20,000 tons a year of that now precious commodity. The matter has been placed before the Board of Agriculture and Fisheries, which is obviously a much interested party, and it is on the suggestion of the Board that the City Council has now decided to apply for a Government grant towards the cost of the necessary surveys and investigation of the proposal.

We congratulate Mr. Britton on having brought forward and secured official consideration of a project which combines so many features of economic advantage to the people of Cheshire.

THE TRAMWAYS AND LIGHT RAILWAYS CONGRESS, 1917.

On Friday last the annual meeting of the Tramways and Light Railways Association took place at the Institution of Civil Engineers, the Hon. Arthur Stanley, M.P., occupying the chair during the preliminary stages. The chairman, in a short speech, welcoming those present, mentioned that the revenue from subscriptions had amounted to £730, and that the expenses had been £647, showing, after allowance is made for certain items, a balance to the good of £91 on the year, and giving, with the balance in hand, a total balance of £522 to carry forward.

Amongst the matters which had occupied the Association during the year were the questions of "leaving certificates" and "substitution": leaving certificates had been abolished and the results of substitution had been somewhat disappointing. The supply of materials had been the most difficult subject, and some relief had been given by the Government offering them materials ready for shipment abroad, also by enabling them to import from America. Negotiations with the authorities in regard to a standard rate of depreciation allowance for motor-buses had, he was glad to say, resulted in an acceptable arrangement.

The balance-sheet having been approved, the following new Members of Council were elected in place of those retiring this year:—Mr. R. J. Howley (B.E.T. Co.) as vice-chairman; Mr. A. Good (Cammell Laird & Co.); Mr. T. B. Goodyer (Croydon); Mr. G. W. Holford (Salford); Mr. C. G. Tegetmeier (Swansea); Mr. W. Thom (Potteries); and Mr. W. E. Hardy (Bath).

After a few words from Viscount Chilston, President of the Association, who occupied the chair during the remainder of the proceedings, Mr. Arthur Norton read a paper on "The Manufacture, Life and Maintenance of Tramway-car Tires," which was illustrated by numerous lantern slides.

In this the author outlined briefly the processes of manufacture from the ingot stage, referred to the importance of accurate gauging of the bore, and described the methods of heating tires prior to shrinking on to the wheel centres, and of removing worn tires, by the use of gas. A safe temperature limit, beyond which it is undesirable to go, is 420° C. The most important section of the paper dealt with the maintenance of tires: the author urged the importance of observing and recording wear, and of maintaining flanges. Less material is cut away from the body of the tire to reform the profile, if differences in wheel diameter are corrected as soon as possible.

Tire wear is adversely affected by (1) systems which operate in very hilly districts; (2) in narrow streets, where sharp curves obtain; (3) narrow-gauge tracks; (4) single tracks with loops; (5) worn condition of tracks; (6) maintenance of car frames; (7) and motors running against each other. The life of a tire is generally concluded when its thickness is reduced to $\frac{3}{4}$ in. or $\frac{1}{2}$ in., although there have been cases where pony tires have been worn to about $\frac{1}{8}$ in.

The author's firm have carried out a considerable number of tests on tramway tires rolled to standard section, some being untreated, while others were subjected to a regular form of heat treatment. The results of falling-weight tests on such tires are shown graphically, being much in favour of the heat-treated tires. The paper contains a number of diagrams of unequal wear in both tires and rails. In conclusion, the author urged on the members the advantages of adopting standard tire-sections.

In the discussion which followed, Mr. Good welcomed the paper, remarking that if it led to managers looking nearer home for the causes of defects instead of blaming the tire makers, it would not have been in vain. The smaller the nip and tension in the tire when in position the better, provided a sufficient margin was allowed. In a particular case, a reduction of $\frac{3}{4}$ in. down to $\frac{1}{2}$ in. nip had solved the question of tires bursting. Cooling tires by water was a dangerous process, particularly with hard tires, and air cooling, which took but little time, should be adopted.

Mr. MOZLEY (Burnley) said they only used bogie cars, and their records showed only negligible variations in tire wear, and flanges gave no trouble. They had scrapped their old trucks, and now obtained excellent results from their own trucks: he wondered at the persistence of the four-wheel car.

Mr. A. R. FEARNLEY (Sheffield) pointed out that the sectional views, showing tire and rail wear at Sheffield, were intentionally bad cases. The uneven and bad wear did suggest that great care was required in selecting the right section of rail: in their case, unfortunately, they could not, under present conditions, replace

the rails of inadequate section, which had been decided on many years ago. It was necessary to turn the tires on the wheels before placing them in service, and a more convenient method of removing used tires was to saw them through. In maintaining tires, they expected to get 5,000 miles' use for $\frac{1}{2}$ -in. wear, and to turn the tires up once or twice to secure a good flange. He thought tire wear was due to some other reason than had yet been found, judging by the different results obtained on systems which operated under practically similar conditions.

Mr. IRELAND (L.C.C.) agreed that a very small percentage of new tires was good enough to go straight on to the road. The question of gauges was very important when many wheels and tires had to be dealt with and interchangeability was required. He agreed with the author that the temperature for shrinking purposes should not exceed 100° C., and did not consider that the use of water for cooling tires was justified. It was much quicker and cheaper to saw old tires off. Experience showed that two tires from the same cast gave very different results: one would wear $\frac{1}{2}$ in. more than another. It was important to keep equal diameters, and in the L.C.C. service, cars were turned daily to equalise wear and tear. He thought the author had not sufficiently mentioned the results obtained with heat and oil-treated tires: tests showed an increase in tensile strength from 55 to 78 tons, and under an abrasive test, while 24 gr. was removed from the untreated, only 142 gr. was removed with the treated tires, showing the remarkable results obtained by oil treatment.

Mr. WILKINSON (Huddersfield) referred to the effect of the differential gear (introduced by himself) on tire wear. It was fully expected that a substantial reduction would occur in wear and energy consumption, but they found, so far, very little saving—only 3,000 miles, in tire life. The track was mostly single; the flanges all wore in the same manner, from tread to flange, and the diameter of tires varied but little, showing not more than $\frac{1}{8}$ in. difference when discarded. No studs were employed to fix tires, but the latter were caulked on the inside to secure them. The band brake employed experimentally had practically doubled the life of tires: it had been in use 2½ years on one route. The gears were adopted to overcome corrugation trouble, and in that respect they promised very well.

Mr. A. V. MASON (South Metropolitan Tramways Co.) introduced the subject of "Return Fares" for discussion, mentioning that women made excellent conductors: that time was saved by platform fare collection, and that return fares and weekly tickets were a convenience to passengers and conductors. He felt that after the war receipts would drop while expenses would remain high, and that the public would have to pay the extra money. One method of securing this, he suggested, was to charge 1d. per mile, divide the mile into four portions, so that overlaps were frequent, and issue single fares at the sums of the 1d. stages—no odd $\frac{1}{2}$ d. values—and return journeys: cheap return tickets would be issued for all fares above 1d.

The 1d. fares were usually over 75 per cent. of all fares taken, and the bulk of the rides were under the mile, so that a fairly drastic proposal was necessary.

The workman was protected by the $\frac{1}{2}$ d. per mile, and a sufficient service before 8 a.m. and after 5 p.m. had to be given. What was wanted was some method of making the short-distance passenger pay who had only the alternative of walking, and to offer competitive attractive fares for long-distance passengers and joy riders.

Mr. C. D. STANLEY (St. Helens) thought it was very necessary to do away with workmen's and similar reduced fares: he did not quite see why getting up early should entitle a passenger to a reduced fare. He thought there was one undertaking which gave no preferential rate, but provided a long stage for 1d. It was very difficult to answer the argument that a man getting less wages than a "workman" had to pay more fare.

Mr. H. ENGLAND (Wakefield) considered the author's ideas were entirely wrong. He disagreed that women were excellent conductors, and with return or exchange tickets. They must run a tramway on a cash basis. He did not agree that receipts would necessarily decrease after the war, and would be glad to join in an agitation for the revision of workmen's fares, as it was unreasonable to carry a man earning £4 or £5 a week at reduced rates.

Mr. HOLFORD (Salford) said his Corporation had abolished return fares, and endeavoured to do the same with all concessions. He could not see why fares should come down again: many towns were shortening the stages, and efforts had been made to raise the statutory fare limits.

Mr. HOWLEY (B.E.T. Co.) hoped that tramway revenues would be maintained after the war, as expenses almost certainly would. Practically the only industry which could not increase the price of its commodity was the tramway industry, and efforts were now being made to obtain sanction to the raising of the statutory limits of fares.

Mr. E. H. EDWARDS introduced the question of "Standardisation of conditions of labour and rates of pay" for discussion. He said that labour long ago came to the conclusion that the best and most satisfactory method of

dealing with conditions of labour and rates of pay was to become united.

It must be admitted that the tramway industry throughout the country was most disjointed. Even the various negotiations with Government Departments had to be carried through by the two Associations instead of one, which involved a considerable amount of overlapping. Further, each authority, without consultation with one another—even in cases where inter-running arrangements were in force—settled its own labour troubles independently, often with disastrous results, which were becoming more and more obvious every day. He suggested the possibility of forming a united tramway federation to deal with these complex problems. There was nothing original in the idea, and he saw no reason why it should not be accomplished in the tramway industry, which was becoming more and more important every year.

It must not be assumed that the proposal was that a standard rate of wages should be established for the whole country, but that the country should be divided into areas, and the rates of wages fixed in such areas in accordance with the cost of living, &c., in such localities. This was the system adopted by such trades as engineering, building, &c.

At the suggestion of the Committee on Production, such a federation was in course of formation, the authorities in question comprising Lancashire and Cheshire Municipal Tramways, and practically all the undertakings in that area, including the companies, had promised to join, and a Sub-Committee had already been appointed to formulate a scheme: he felt confident that the great majority of tramway undertakings throughout the remainder of the country would be equally pleased to join a central federation, should one be formed.

Mr. HOLFORD (Salford) supported the proposal: it was felt that such a federation would be advantageous both to the undertakings and men, and that many troubles would disappear if an area were dealt with.

Mr. HOWLEY (B.E.T. Co.) suggested that the proposal amounted to the standardisation of wages and conditions of work. He doubted whether their Association could deal with wages, but it could render assistance in equalising conditions of work.

Mr. WHITE (Grimsby) said the Trade Union officials did make some allowance to company undertakings which had no ratepayers behind them. He saw difficulty in getting uniformity in wages, though that might be arranged in regard to conditions of labour.

Mr. RONSON (Southampton) thought there would be difficulty in arranging uniform rates of pay even in small areas, but uniform conditions of work could be arranged; he hoped the Association would take the matter up. The author, in reply, said it was difficult to separate wages and the conditions of labour, and he thought it quite feasible to copy the engineering trades in regard to uniformity in certain localities.

Women Drivers.—MR. A. ROBERTSON then gave a brief résumé of the Greenock and Port Glasgow Tramway Co.'s experience with women drivers, who represent 62 per cent. of the total. The earlier ones were the better trained, and had scarcely any accidents. The necessity of time-keeping was not always recognised by them, and they were not so satisfactory in emergency as the men.

Mr. FRED COUTTS (Paisley) said his experience was the opposite to that given by Mr. Robertson. While women made good conductors, his experience with them as drivers had been unfortunate: only 13 out of 39 passed out after training, and those who qualified had, owing to physical disabilities, dwindled down to one, who had been driving 18 months. From an inspection of the Glasgow service he found that about 8 per cent. of the cars were driven by women, which was nothing to boast about. They had a heavy workmen's service in the morning, some 14,000 early passengers being carried each day, and, if the women drivers failed to turn out, it would be a serious matter. He had greatly improved time-keeping by introducing a bonus arrangement, with considerable deductions for broken time.

Mr. STANLEY (St. Helens) said he thought there was a labour objection to the use of women drivers, and Mr. MASON (Sutton) said he felt that the only way out of the labour shortage was to employ women as drivers on level roads.

ERRORS OF REGISTRATION OF ELECTRICITY METERS WITH VARYING LOADS.

By G. W. STUBBINGS.

THE errors of registration of electricity meters over periods during which there is a variation of the current passing are a matter of considerable interest. The problem of obtaining the errors of meters on constant loads is one of great sim-

plicity, but this information gives no *prima facie* indication as to the degree of accuracy with which a meter will register over a period during which the load may vary between wide limits. An interesting case of this question is that of a house in which a moderate load is used for a few hours in the evening, one light through the night, and an occasional use of one light, an electric iron, or some similar device throughout the day. The inaccuracy of the meter on one light may be considerable, but the important point is the extent to which this error will affect the total inaccuracy over such an extended period as one day. The present article is an attempt to investigate this question theoretically, and it may be observed that the results apply equally to cases of rapidly varying loads, such as are taken by certain machines. The investigation is concerned with ampere-hour meters only, and variations of voltage have not, therefore, to be taken into account. The performance of a theoretically accurate meter with varying currents has been previously investigated, and it is now well known that such a meter with eddy-current braking, whether shunted or not, correctly records the total quantity of electricity, notwithstanding any variation of the current.

The case of a meter of the commutator type may first be considered. With such a meter the error is due to an approximately constant frictional torque, and the percentage error curve is of the form $\eta = \kappa - n/c$, η being the percentage error; n a constant depending on the frictional torque; κ , the percentage difference between the correct and ideal speeds of the meter; and c , the current passing. Since the meter is inaccurate, the speed of the meter rotor will correspond to an inaccurate value of the current, which will be—

$$c_m = c(1 + \kappa/100 - n/100c), \\ = c + \kappa c/100 - n/100.$$

This expression refers to instantaneous values of the current, which may be any function of the time. The quantity recorded by the meter will, therefore, be obtained by integrating the expression between the limits 0 and t' , t' being the time during which current has been passing.

$$\int_0^{t'} c_m dt = Q + \kappa Q/100 - nt'/100,$$

Q being the correct quantity. The percentage error will accordingly be $\kappa - n/c_a$, c_a being the average current over the period t' . It therefore follows that in the case of a meter with an error curve of the form given, the error of registration over a period will be the error at the average current over the same period, whatever be the nature of the variation of the current.

A simple numerical example may be taken of a meter with a percentage error of $2 - 2/c$, used for four hours per day on a constant load of 2 amperes when the error is 1 per cent. fast, and for the remaining 20 hours on a load of 0.2 ampere when the meter is 8 per cent. slow; the average load being $\frac{1}{2}$ ampere, the inaccuracy of registration over the period of one day is 2 per cent. slow.

It will be immediately apparent that t' in the above investigation refers only to times during which current is passing through the meter, and that, therefore, the average current is to be reckoned on this time only, and is not to be taken over periods of no load. This follows, of course, from the fact that however bad the performance of a meter may be, on even moderately low loads, it is always quite accurate on no load. The assumption has also to be made that the lowest current passing is greater than starting current, otherwise the expression for percentage error will not be applicable.

The case of a meter having fluid as well as solid friction, may now be considered. With such a meter the error curve will be of the form $\eta = \kappa - n/c - m c$, m being a constant depending upon the magnitude of uncompensated fluid friction. We have therefore—

$$c_m = c + \kappa c/100 - n/100 - m c^2/100 \\ \int_0^{t'} c_m dt = Q + \kappa Q/100 - nt'/100 - (m/100) \int_0^{t'} c^2 dt, \\ \text{the percentage error being } \kappa - n/c_a - (m/Q) \int_0^{t'} c^2 dt.$$

The portion of the error due to fluid friction is therefore proportional to the ratio of the mean square of the current,

to the average value of the same, and such value of the fluid friction error will thus always be higher than that at the average load. In the case of most house-service meters, not only is the compensation for fluid friction fairly complete, but the effect of such friction is at the usual loads very small; the value of κ is also, owing to the different shape of the error curve, higher than in the case of a meter with solid friction only. It is therefore legitimate to assume that the accuracy of a house-service mercury meter over extended periods will be equal to that of a commutator meter under similar conditions, the circumstance of variation of current only being taken into account.

The effect of fluid friction with meters of higher capacities will become more important with varying loads, the magnitude depending upon the nature of the variation. With a load corresponding to $c = c_a (1 + a \sin pt)$, the ratio of the mean square to the mean current will be $c_a (1 + \frac{1}{2} a^2)$, and the effect of fluid friction is sensibly increased. An example may be taken of a 25-ampere meter having the values $\kappa = 4$, $n = 2$, $m = \frac{1}{2}$ in the above formula. The errors at full, half, one-quarter, and one-twentieth loads will be respectively 2.1 per cent. slow, 0.8 per cent. fast, 2.2 per cent. fast, 2.0 per cent. fast. Assuming $c_a = 16$ and $a = \frac{3}{4}$, the current will vary between 4 and 28 amperes. The percentage error being $\kappa = n/c_a - m/c_a (1 + \frac{1}{2} a^2)$, substitution of the assumed values gives a figure of 1.25 per cent. slow, corresponding to the error for a constant current of about 20.6 amperes.

THE MEETING OF THE INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION, 1917.—III.

Fuel Economy.

Abstract of paper by J. A. P. JATSON (Salford).

THE necessity for fully utilizing our national resources to meet the economic conditions arising out of the war has made the question of fuel economy one of urgent and vital importance. The subject is under consideration at the present time by a sub-committee appointed by the Advisory Council of the Department of Scientific and Industrial Research, of which Sir George Beilby is chairman, and will no doubt also receive attention from the Departmental Committee on Electricity Supply recently set up by the Board of Trade.

It goes without saying that any proposals on national lines for economising fuel must necessarily include a large co-ordinate scheme for the cheap production of electricity, and the time is therefore opportune for consideration of the question by this Association, representing electrical undertakings whose output amounts to 70 per cent. of the total output from statutory undertakings in this country.

It is proposed to discuss in the paper the possibility of economising fuel:—

- (a) By centralising the production of power; and
- (b) By combining the carbonisation of coal and by-product recovery with the generation of electricity.

For the present purpose the discussion may be confined to the better utilisation of coal.

After deducting the amount of coal exported, the home consumption of coal in 1911 was 184 million tons. It remains to be considered in what directions economy is possible.

With regard to the fuel used for blast furnaces and iron and steel production, considerable economies have been effected in recent years. The employment of modern coke ovens with by-product recovery plants, referred to later in the paper, has extended rapidly, and as a considerable amount of surplus heat is available for the production of power, a modern coke oven installation may be regarded as an extremely economical method of coal utilisation. While the electrification of railways would, in addition to other advantages, improve their working efficiency, it would not, the author thinks, greatly affect the amount of fuel consumed. There is much room for economy in the fuel consumed at mines and also in chemical trades. For power-station engineers the two items of outstanding interest are "Factories" and "Domestic Purposes," representing a consumption of 45 million tons and 39 million tons per annum respectively.

In view of the growth of power-using industries since 1907, the horse-power now installed for factories, including electric motors, cannot be less than 13 million horse-power, and is probably more.

It will be fairly safe to estimate that at the present time each horse-power hour produced entails a consumption of 4½ lb. of fuel.

To engineers who consider this a high figure, it may be pointed out that for the central stations furnishing returns

for the 1907 census of production the consumption of coal comes out at 5.1 lb. per unit, or about 3.9 lb. per electrical horse-power hour.

In considering these fuel consumptions, regard must be had to the low price at which fuel could be purchased up to recent years.

In the matter of fuel consumption, the central station has enormously improved its position relatively to the private power plant during the last few years. The development of the steam turbo-generator, the general adoption of extra high-tension transmission, the increased output, and the improved load factor, have undoubtedly effected a considerable reduction in the 1907 figure of 5.1 lb. per unit.

In a census taken last year of four groups comprising 26 electrical undertakings in Lancashire and Cheshire ranging in capacity from 500 kW. up to 90,000 kW., it was found that the consumption of coal varied from 2½ lb. to 8 lb. per unit sold; the average consumption of all the undertakings in the groups (including the largest municipal undertaking in Britain) being 3.2 lb. The average calorific value of the coal may be taken as 12,500 B.T.H.U. This figure, equal to 2.4 lb. per horse-power hour, represents a reduction of 52 per cent. compared with Sir George Beilby's estimate in 1905, and 37 per cent. compared with the average consumption in central stations in 1907.

Very little consideration of these figures is required to show that a considerable fuel saving could be effected by an immediate transference of the factory power load from private plants to central stations. Even admitting that as much as one third of the total coal consumption in factories is required for direct heating purposes, it will be observed that the transference of the remaining two thirds of the load to central stations under existing conditions would effect a saving of not less than 15 million tons of coal per annum.

With a consumption of 3.2 lb. per unit of fuel containing 12,500 B.T.H.U. per lb., the thermal efficiency comes out at only 8½ per cent. There are several power stations in the United States claiming an overall efficiency of 17 to 18 per cent. Under a centralised system of production operating with power stations equipped with generators of 15,000 or 20,000 kW. capacity, combined with water-tube boilers of 10,000 kW. each, and auxiliary plant designed and arranged so as to reduce the heat losses to the absolute minimum, a continuous thermal efficiency of 18 per cent. is well within the range of possibility. In support of this claim the following estimate prepared by a well-known firm of manufacturers for a combined generator and water-tube boiler unit of 15,000 kW. capacity is submitted.

Steam pressure at stop valve	200 lb.
Initial steam temperature	650° F.
Vacuum at turbine exhaust (30-in. barometer) ...	29 in.
Feed-water temperature to economiser ...	160° F.
Steam consumption at full load per kW.-hour ...	10.4 lb.
Power required for condenser auxiliaries ...	2 per cent.
Thermal efficiency of turbine, generator, and auxiliaries	25.19
Boiler efficiency	84
B.T.H.U. per kW.-hour	16,120
Thermal efficiency, boilers, economisers, turbine, generator, and condenser plant ...	21.15

If we add the power required to operate artificial draft plant, coal and ash conveyors, and circulating water pumps (this should not under normal conditions exceed 3 per cent.), the efficiency of the plant, i.e., the ratio between the heat units contained in the coal consumed and their equivalent in kW.-hours delivered at the switchboard is 20.5 per cent.

Further economies in fuel consumption are possible by increasing the pressure and temperature of the steam. The boiler manufacturers are satisfied that there will be no trouble in constructing boilers for pressures as high as 500 or 600 lb., and the turbine manufacturers are prepared to guarantee turbines to operate at this pressure with steam superheated up to 750 deg. F. Boilers have already been constructed for 350 lb. pressure, and the following estimates which the British manufacturers guarantee may be compared with the figures in the previous table.

Steam pressure at stop valve	350 lb.
Initial steam temperature	700° F.
Vacuum at turbine exhaust (30-in. barometer) ...	29 in.
Feed water temperature to economiser ...	160° F.
Steam consumption at full load per kW.-hour ...	10 lb.
Power required for condenser auxiliaries ...	2 per cent.
Thermal efficiency of turbine, generator, and auxiliaries	26.39
Boiler efficiency	84
B.T.H.U. per kW.-hour	15,370
Thermal efficiency boilers, economisers, turbine, generator, and condenser plant ...	22.17

The increased efficiency due to increased pressure and super-heat is approximately 5 per cent. Allowing 3 per cent. for operation of auxiliaries and 12 per cent. for transmission and transformer losses, it is possible to obtain an overall efficiency of 18.8 per cent. for energy delivered to the consumer. The coal consumption on this basis would amount to 1.15 lb. per kW.-hour sold, or 1.00 lb. per electrical horse-power.

If several large stations are interconnected, it will be quite

possible to operate the plant in commission continuously at or nearly at full load. Under these conditions, the author is of the opinion that 10 per cent. would be ample to cover stand-by and light-load losses.

Turning again to Sir George Beilby's estimate, and assuming a consumption of fuel at the present time for factory purposes of $4\frac{1}{2}$ lb. per horse-power hour, the possible saving is about $3\frac{1}{2}$ lb. of fuel, or nearly 75 per cent. It follows that if two-thirds of the factory load was transferred the saving in fuel would amount to approximately 22 million tons per annum.

With regard to the consumption of fuel for domestic purposes amounting to 39 million tons per annum, it is questionable if the efficiency, i.e., the ratio of heat units actually utilised to the heat units contained in the coal consumed is more than 5 per cent. The use of gas fires and gas cooking appliances is undoubtedly on the increase, and although some may be inclined to disagree, it must be admitted that for convenience and cleanliness they possess distinct advantages. On the other hand, the products of combustion must be got rid of at the expense of heat in the fuel, and it is doubtful if the actual efficiency of gas fires is more than 10 or 12 per cent.

Taking the same basis of comparison, the efficiency of electric radiators and cooking devices may be as high as 85 to 90 per cent., while for convenience and cleanliness they far surpass the gas fire or gas cooking stove. The author is familiar with a cooking installation of 150 kw. capacity at a cotton mill providing 700 meals per day, which has given complete satisfaction both on the score of reliability and economy, with energy costing 1d. per unit. If energy can be sold at prices from $\frac{3}{4}$ d. to $\frac{1}{2}$ d. per unit, electric cooking would undoubtedly become universal.

In a particular case a domestic consumption of 13 tons of coal per annum was reduced to 2 tons by the adoption of electricity for cooking and partial heating. The increased consumption of electricity for four quarters of one year amounted to 6,820 units. Assuming a consumption of $1\frac{1}{4}$ lb. of coal per unit, the total amount of coal consumed at the central station for this output would amount to 11,900 lb., or approximately $5\frac{1}{4}$ tons per annum, as compared with 11 tons saved, or a reduction of nearly 52 per cent. If only one half the cooking and heating for which coal is now used was performed by electricity supply from central stations, there is a possible saving of nearly 10 million tons per annum.

It is outside the scope of this paper to estimate the cost of a national centralised system of electricity production, but it appears beyond question that the saving in fuel, amounting to not less than 30 million tons per annum for factories and domestic purposes alone, would be amply sufficient to meet the charges on the capital expended, and also to compensate those existing interests which might be adversely affected.

If British manufacturers are to have a fair chance a cheap supply of power is absolutely necessary. The benefits to the nation, direct and indirect, would be so great that the Government would be justified in supporting a centralised scheme of power production with the national credit, and in making such regulations as might be required to ensure its successful operation.

Interconnection of Electrical Undertakings.—The original object of the linking-up proposal was to meet the special conditions arising out of the war. While fuel saving was put forward in the Board of Trade circular letter as the object of linking-up, its chief advantage, in the author's opinion, is that it will permit the capacity of existing stations to be more fully utilised to meet the increased demand for power which may be expected after the war. As a means of fuel saving it will, however, exercise an important effect, as it will be possible with a system of linked-up stations to utilise the more efficient plant to its fullest extent, shutting down the less efficient plant during the night, at week-ends, and other times of light load. In the case of the 26 Lancashire undertakings already referred to, it was estimated that 110,000 tons per annum could be saved.

Linking-up proposals must, however, be considered with relation to the bigger scheme of centralisation, and it will be necessary for the local joint boards who operate such schemes to possess powers with regard to extensions of plant in all the undertakings in their group, and so ensure that extensions will only take place at those stations which are favourably situated for economical generation. If only stations which are favourably situated for economical generation are permitted to install new plant, many of the smaller stations could shut down immediately, while others might retain a portion of their plant to meet peak load demands.

In no case should financial considerations alone prevent the supersession of inefficient generating plant. In those cases where the financial burden would be temporarily increased, it will be sound policy in the national interest to extend the repayment period, or even to suspend the payment of outstanding loans, until such times as the economies from the new system can be fully realised.

Carbonisation of Coal.—It is common knowledge that from a purely thermal efficiency point of view, the carbonisation of coal in gas works is a much more efficient process than the direct burning of coal in central power stations. The thermal efficiency of a gasworks may be as high as 65 or 70 per cent., whereas the average thermal efficiency of central power stations is in the neighbourhood of 8 or 9 per cent., although several large power stations are obtaining efficiencies of

between 12 and 15 per cent. The following comparison will illustrate this point:—

ELECTRICITY WORKS.	GASWORKS.
1 ton of coal (12,500 B.T.H.U.) burned direct in boiler furnaces will produce, at $2\frac{1}{2}$ lb. consumption per unit, 896 units of electricity.	1 ton of coal (12,500 B.T.H.U.) will produce 11,000 cb. ft. of gas = 6,050,000 B.T.H.U., 9 cwt. of coke of 9,500 B.T.H.U. per lb. = 9,576,000 B.T.H.U., 10 gallons of tar = 1,550,000 B.T.H.U.
Thermal value = 2,965,000 B.T.H.U.	Total, 17,176,000 B.T.H.U.
Thermal efficiency, 11 per cent.	Thermal efficiency, 64 per cent.
Total heat in coal 26,992,000 B.T.H.U.	

There is no direct economy in carbonising coal for the purpose of producing gas to be utilised for firing steam boilers. The amount of coal consumed by such a process must always be greater than the amount of coal required to produce an equivalent amount of heat by direct firing. The whole question turns on the value of the by-products produced, and before any general scheme of coal carbonisation is adopted it will be necessary to ascertain if there is a permanent and remunerative market for these. If the cheap production of electricity will lead to its universal adoption, it would be a mistaken policy, for instance, to carbonise coal with the sole or primary object of producing a smokeless fuel for domestic purposes.

To obtain the highest possible efficiency in power production from the carbonisation of coal involves the employment of internal-combustion engines. The high thermal efficiency of gas engines (about 27 per cent.) has often attracted power engineers, but although enormous sums have been spent on their development in large sizes, they can hardly be claimed as a commercial success.

There are two systems apart from the carbonisation of coal in gasworks (where illuminating gas is the chief product) which may be considered. These are:—

(a) Producers of the "Mond" type, in which coal or coke is burned to an ash with or without the production of by-products.

(b) Coke oven installations, which distill coal at a low temperature producing metallurgical coke as the chief product, with a certain amount of surplus gas and other by-products.

The "Mond" producer has been in use for gas engine installations with and without by-product recovery plants for at least 20 years. It produces gas at the rate of about 120,000 cu. ft. per ton of coal carbonised, having a calorific value of 150 B.T.H.U. per cu. ft.

When employed for by-product recovery, sulphate of ammonia is obtained equal to about 4 per cent. of the weight of coal carbonised, and about 3 per cent. by weight of a somewhat inferior tar. The thermal efficiency of a "Mond" producer may be taken at 65 per cent. when employed solely for the production of gas. If employed with by-product recovery, the efficiency is reduced, owing to the larger amount of steam—about two and a half times the weight of coal carbonised—which is required for the furnace. It will be a fair estimate to assume that the efficiency under these conditions is about 57 per cent.

Gas Firing of Boilers.—Considerable difference of opinion appears to exist regarding the efficiency of gas-fired boilers, some authorities placing it as low as 75 per cent., while others claim 85 or 90 per cent. The lower efficiency is probably the result of tests made with boilers and furnaces originally designed for the direct burning of coal. Prof. Bone, in his address to the Royal Institution last year, put forward the following comparison between the Bone-Court surface combustion gas-fired boiler and direct firing.

	Gas-fired surface combustion boiler.	Coal-fired boiler.
Heat utilised	92.7	75.1
Heat lost:—		
In burnt gases	3.0	18.1
In unburnt gases, &c.	Nil	2.8
By radiation	4.3	4.0
	100	100

*Assuming an efficiency of 90 per cent. for gas firing and 80 per cent. for direct coal firing, we obtain the following results:

	Per cent.
Efficiency of gas-fired producer with by-product recovery	57
Efficiency of gas-fired boiler	90
Combined efficiency	51.3
Efficiency of direct-fired boiler	80

In other words, for every 100 tons of coal consumed for direct firing we require 155 tons to produce the same amount of heat from producer gas-fired boilers, against which we recover 4 per cent. by weight of sulphate of ammonia, and 4 per cent. by weight of tar.

An incidental advantage of gas firing is the cleanliness of the boiler house and the better control of the fuel supply. There should also be a slight reduction in the labour and maintenance costs. On the other hand, the efficiencies claimed for gas producers are only possible with a high load factor, and in the case of central stations it would be necessary in most cases to supplement gas firing with coal-fired boilers for dealing with fluctuations of load.

It is apparent, therefore, that the whole case for gas firing from producer plant rests on the production of by-products. The most valuable of these is sulphate of ammonia. The amount of this by-product depends upon the percentage of nitrogen present in the fuel. The average for British coals may be taken at 1.3 per cent., yielding in a "Mond" producer from 80 to 90 lb. of ammonia sulphate per ton carbonised.

The following estimate, based on results obtained from smaller plant, is put forward as an illustration of what might be expected from a producer gas-fired boiler installation of 25,000 kw. capacity, dealing with a maximum demand of 15,000 kw. and operating with a 40 per cent. station load factor.

DIRECT FIRING. (Boiler efficiency 80 per cent.)

53,000,000 units at, say, 2 lb. of coal per unit generated; tons	=	48,000
Coal at 15s.	=	£36,000

GAS PRODUCER AND GAS-FIRED BOILERS WITH BY-PRODUCT RECOVERY.

Boiler efficiency 90 per cent.	
Combined efficiency 52 per cent.	
74,000 tons of coal at 15s.	...
2,960 tons of acid at £2	...
Extra labour on gas plant at 1s. 3d. per ton carbonised	...
Extra stores	...
Extra labour on by-product recovery, including bagging sulphate of ammonia	...
Interest, depreciation, and maintenance on cost of producer and recovery plant, 15 per cent. on £52,000	...
	= 7,800
	£78,195
Less 2,960 tons ammonia sulphate at £14 per ton	...
Less 2,960 tons of tar at £1 per ton	...
	44,400
	£33,795

A saving per annum over direct firing of ... £2,205

The figure of £14 for ammonia sulphate is above the average price received during the last 10 years, but about £2 less than the present war price of £16 per ton. If the present price is taken, the saving would be increased from £2,205 to £8,125. On the other hand, on the basis of £12 per ton, which approximates to the average pre-war price, the saving of £2,205 would be converted into a loss of £3,715.

Although producers have been in operation for 20 years, it is not suggested that finality of design has been reached. Experiments have recently been made with a view to utilising the heat generated by the producer to supply the steam required for by-product recovery, and it is possible that developments in this direction may increase the producer efficiency by 8 or 10 per cent. It has also been shown that producers can deal successfully with the lower grades of fuel, and as these poorer grades frequently contain as high a percentage of nitrogen as the richer grades, it may be possible to utilise the producer with by-product recovery for burning grades of coal which it is not profitable under present conditions to bring to the surface.

Coke Oven Gas.—The distillation of coal at low temperatures for the primary purpose of producing metallurgical coke, and yielding in addition a quantity of surplus gas of high calorific value in addition to other by-products, has been advocated in certain quarters as a universal solution of the fuel economy problem. The low temperature at which the coal is distilled permits of the recovery of by-products which are lost in the producer system. The chief of these are benzol and a rich quality of tar, from which are derived toluene, naphtha, picric acid, and the basic materials for the manufacture of aniline dyes.

Each ton of coal distilled produces about 15 cwt. of hard blast furnace coke, which at present has a higher market price than its equivalent weight in coal. On the other hand, the yield of ammonia is less than from gas producers, being about 25 to 30 lb. per ton of coal. Hitherto the industry has been confined to steelworks and collieries, where its advantages are unquestioned, but the importance of the by-products recovered and the possibility of utilising the surplus gas has drawn attention to the possibility of combining low temperature distillation with the production of power. The amount of surplus gas is equal to 4,000 to 5,000 cu. ft. per ton, having a calorific value of 550 B.T.H.U. per cu. ft. The expense of the installation, however, is very great, and the amount of coal consumed to produce a given amount of heat in the form of surplus gas is about 12 to 14 times as much as would be required for direct firing.

Very little consideration is required to show that as a means of producing power, the coke oven can only have a limited application. The demand for electricity in the form of light, power, and heat is bound to exceed enormously the demand for coke and by-products, and while the surplus heat from coke oven gas should be fully utilised, either in independent power stations or where convenient in conjunction with

larger power systems, the process cannot be looked on as more than a partial solution of the fuel economy problem.

It is claimed that instead of metallurgical coke, a soft smokeless fuel can be produced which is suitable for domestic purposes; the author is of opinion that an arrangement of this kind can only have a local and temporary application, and that the burning of fuel for domestic purposes must ultimately be superseded by electricity.

Coal Supplies.—While it is proved beyond doubt that vast economies are possible by the better utilisation of coal, there is also an enormous wastage going on in mining operations. Coal should be regarded as our national capital—a vanishing capital, unfortunately—and the greatest natural source of the country's wealth. The proper grading and classification of coals and their treatment by washing and sorting is a subject which is worthy of the continuous attention of a committee of scientific experts.

The saving already estimated through better utilisation would probably be doubled under a scientifically organised system of coal production.

Conclusions.—To secure the most economical utilisation of the national coal supplies, it is necessary to centralise the production of electricity on a large scale, and to adopt a scheme for its distribution over suitable areas formed without regard to existing municipal boundaries. The consequent cheapening of production would ensure the general use of electricity, and would result in a saving in fuel now consumed in factories, and for domestic purposes of not less than 30 million tons per annum.

That the erection of large power stations on sites selected for economical working, and equipped with turbo-generators and direct-fired boilers, is at present the only proved method of economical power production on a large scale.

That careful investigation should be made of the present and potential demand for sulphate of ammonia and other by-products, and the sources from which such by-products are likely to be available in future. That in some cases the generation of electricity can be combined with the production and manufacture of by-products.

In the case of coke oven installations producing blast furnace coke, the surplus heat should be fully utilised in gas-fired boilers for the generation of electricity.

That in order to organise the economical production and distribution of coal, the control and operation of all coal mines in the United Kingdom should be placed under a central expert authority, the object being to prevent wastage in producing coal, and also to avoid unnecessary transport in conveying coal from the collieries to the users.

DISCUSSION.

Dr. FERRANTI, in opening the discussion, said the coal consumption was the vital question, the by-products were the other vital matter, though a solution of the latter question was not perhaps feasible now. He took it that distribution costs would also come down with greatly extended use of electricity. When he discussed the matter before the Institution of Electrical Engineers in 1910, he had hoped that greater economy would be obtained generally, and had suggested a thermal efficiency of 25 per cent., while the author took 18 per cent. as a possible figure. In the cheaper generation of electricity to-day there was, unfortunately, no by-product; the gas engine was handicapped by the inefficiency of gas making, as the cost of obtaining by-products absorbed the profit. In any case, at its present price sulphate of ammonia was too costly, though if the price were, say, £8 a ton, as he estimated it in 1910, there would be a great demand for it. By improving the efficiency of the conversion of coal into power, and realising to the necessary extent the by-products, the process of providing a general supply of electricity was automatically started. He congratulated the Association on the work it had done, and on the paper under discussion; nothing so vitally affected the welfare of the country as a cheap supply of electricity.

Baillie SMITH (Glasgow) said he was specially interested in the carbonisation of fuel and by-product recovery, in which his Corporation had had three years' experience. The plant dealt with about 20 tons a day, and it had proved practicable to make power gas for boilers and recover by-products on a commercial basis. The results were better than those indicated in the paper; although there was no tar, they got £14,800 for the liquid obtained, as against only £2,000 for tar, and the saving was about £20,000, as against £2,200 shown by the author in his paper. Much cheaper coal could be used, and only 1 lb. of steam per lb. of coal, as against 2½ lb. in the Mond process, was required. The liquid by-product divided into a series of resins which gave them a number of dyes direct, and they could dispose of sulphate of ammonia at £4 per ton, and still make a profit. The equipment could be arranged to produce gas or gas and smokeless fuel; the latter was an amorphous coke, while gas coke was more graphitic, and less easy to burn. Experiments showed that 13 cwt. of this smokeless fuel gave more heat than a ton of ordinary coal, in addition to chemicals and gas of 300 B.T.H.U.

Mr. DICKINSON (Liverpool) drew attention to the necessity of solving the difficulty of heating water electrically, if domestic heating by electricity was to be developed. The

question of interlinking supply undertakings must be looked at broadly.

Mr. C. H. WORDINGHAM (President-elect, Inst. of Electrical Engineers) thought no sane person would dispute the value of the super-station; he felt strongly that general power supply would be brought about by linking-up, co-ordination of supplies, and the use of super-stations. On the whole, he agreed with the author. Was the primary object very economical use of coal or to make the most of the coal by extracting the by-products? He had been much criticised for advocating the combination of the gas and electrical interests, but it was foolish to throw away the gas engineers' knowledge, and they should strive to get the maximum possible out of the coal. He firmly believed that progress would be slow unless there was agreement between the public and private supply interests, and a scheme on a sound financial basis was carried out. He thought it would be preferable to set up a controlling authority to ensure that future development was on correct lines. He agreed with the author's views in regard to electric cooking.

Mr. SELWY agreed with the author practically throughout, and with his conclusions. There were matters affecting the use of coal which were not referred to in the paper. If a poorer coal were worked generally, the cost per B.T.U. to the public would be increased. The increased use of power in the pit did not necessarily mean an increased output from the mine. Coal carbonisation resulting in by-product recovery meant additional supplies, and they must move cautiously in the matter.

Mr. S. J. WATSON (Bury) suggested that station engineers should find out what power was used in their areas; in his case, he found that he supplied about 20 per cent. of the industrial load, and he thought it would be found that great increases had occurred during the last three years. He agreed that the thermal efficiency of electric heating was high compared with other means. Carbonisation schemes required more coal, labour, and money, and were not likely to be adopted during the war; he thought they should strive for simplification rather than complication of processes.

Mr. H. S. ELLIS (South Shields) drew attention to the average figure of 5 lb. coal per H.P.-hour for factories, mentioned in the paper, and said that in the case of Bradford, he considered it should be nearer 2 lb.; he also asked whether coal for heating purposes was included in the figure.

Mr. GEOFFREY PORTER (Bexhill) complained that oil fuel had been neglected by the author. He and others were now using coal tar oils, produced in this country, with Diesel plant, and no difficulty was experienced in obtaining overall thermal efficiencies of 25 to 28 per cent. They obtained 2,000 units per ton of oil, as against only some 800 units in the case of turbine plant. There was an extensive shale belt in this country available for oil production, and he thought the smaller isolated supply areas would be more economically worked by using oil engines than by linking-up with bulk suppliers.

Mr. CLEGG (Accrington), speaking from experience of Mond plant and large gas engines, modified some of the author's figures for by-products, and agreed with him that the large gas-engine installation was not suited for the requirements of a centralised power scheme.

Mr. ROBERTSON, in reply, said the figures for the Glasgow experimental gas plant were very interesting, but he rather doubted the capital cost of £13,000. He had an open mind in regard to coal carbonisation processes, and had not considered the combination of gas and electricity works, but if that would result in national fuel saving, he felt that it must be considered. He was interested in the estimate (by Mr. Selvey) that only half the factory power in the country would utilise some 8,000 million units per annum; the present output for all purposes was about 2,000 million units. No doubt Mr. Clegg's results from by-product plant were not unusual at the present time, and as between them and those given by Bailie Smith, they must keep an open mind. He thought that the available oil fuel would not be much more than sufficient for naval and mercantile marine purposes for some time to come.

Electric Vehicle Committee of Great Britain.

(Formed under the auspices of the I.M.E.A.)

ANNUAL REPORT (abstract).

Constitution of the Committee.—During the period covered by this report, the constitution of the Committee has been broadened by including representatives of the following bodies:

- The Society of Motor Manufacturers & Traders, Ltd.
- The Royal Automobile Club
- The Institute of Cleaning Superintendents.
- The British Rubber Tire Manufacturers' Association.
- The Institution of Automobile Engineers.

Journal. The Committee's journal, *The Electric Vehicle*, has been published each quarter, and continues to gain in popularity, as evinced by increased sales.

In regard of Electric Vehicles. As the result of negotiations, the Car and General Insurance Corporation, Ltd., agreed to make certain alterations in their Special Electric

Vehicle Policy in order to bring it into line with the Committee's views.

Charging Plug and Receptacle.—In regard to the British standard charging plug and receptacle, it was decided to suggest to the Engineering Standards Committee that the length of the encasing shell of the receptacle should be increased by 11/16 in. (18 mm.). This alteration does not entail any change in the dimensions of the contacts or insulating shield, nor will it prevent the receptacle with the increased dimension receiving the plug as at present standardised.

The design is not covered by any patent, consequently any manufacturer in this country is at liberty to make it.

Government Regulations.—The Committee has paid close attention to orders and regulations issued by Government Departments affecting the manufacture and employment of motor vehicles. At the present time, no vehicle can be made or imported unless for purposes directly or closely connected with war work.

Local Government Board Loans.—The Committee has had under consideration the short-loan periods recently granted by the Local Government Board for the purchase of motor vehicles, and a communication was sent to the Board expressing the hope that upon the termination of the war the latter would be prepared to consider evidence, showing that the actual useful life of the electric vehicle was such as to justify a considerably longer period than five years.

Tire and Roadwear Research Committee.—Through the courtesy of the Society of Motor Manufacturers and Traders, the Committee now has a representative upon the Tire and Roadwear Research Committee that has been formed by the Society. The Committee's representative is Mr. E. W. Curtis.

Charging Facilities.—A list of charging stations in England, Scotland and Wales has recently been compiled. The list contains the names of over 200 stations, and gives particulars as to maximum charging current available, hours during which charging can be done, tariff, garaging accommodation, &c.

Progress in the Adoption of Electric Vehicles.—The total number recorded as being in use or on order at the end of March, 1917, was 914; this compares with 680 in the previous year.

Manufacture of Vehicles and Equipment.—In view of the probable demand for electric vehicles after the termination of the war, the Committee sent to all automobile manufacturers in Great Britain a circular letter suggesting that the manufacture of electric vehicles should be given consideration as a branch line to the manufacture of petrol vehicles. A somewhat similar letter was addressed to electrical manufacturers suggesting the advisability of producing, after the war, the electrical equipments for electric vehicles.

The Committee wishes again to place on record its high appreciation of the voluntary services of its Hon. Secretary, Mr. F. Ayton.

AN ENLARGED ELECTRON OF PRACTICAL SIZE: THE FARADAY.*

By CARL HERING.

It is the fashion to-day to talk in terms of electrons, the entities which compose the atoms. Physicists tell us that the smallest atoms are about one-three-hundred-millionth of an inch in diameter, and the largest not many times this; that there would have to be a row of about 200 of them to form something large enough to be visible in the most powerful microscope known; that if a drop of water were enlarged to the size of the earth, the atoms in it would be about the size of a base-ball; that helium gas contains 77 billion-billion atoms per cubic inch, presumably meaning at atmospheric pressure. And still further straining our abilities of conception, they tell us that the negative electrons, which are supposed to be all alike, are about a one-hundred-thousandth part of an atom; that if an average atom were enlarged to a sphere 100 yards in diameter, the electron would be about the size of a pin-head, though its density is said to be a million-million times that of the atom.

Such staggering and bewildering figures, and the fact that they are not yet accurately known, make it impossible to talk quantitatively about electrons in practice, yet if the engineer is supposed to deal with electrons he must know something more precise about the quantity of negative electricity which an electron represents.

The chemist, who has had to deal with these tiny atoms in a quantitative way, has solved this difficulty in practice by the ingenious and perfectly satisfactory and accurate method of imagining a practical substantial form of atom, or "life-size" atom, to consist of a certain number of millions of the real atoms; the exact number is not known, nor is it necessary to know it, as long as all of them have been increased exactly the same number of times. If the atomic weight of hydrogen is 1, then this aggregation, or enlarged, practical

* From *Metallurgical and Chemical Engineering*.

atom is by definition such that it weighs 1 gram, and when the atoms of all the other elements are increased in number the same number of times the practical atoms will weigh as many grams as are represented by their atomic weights; these enlarged, practical atoms are the well-known gram-atoms of the chemist, the gram-molecules being similarly defined. These practical atoms are quite substantial and workable amounts, being easily weighed and measured. Thus a gram-atom of copper weighs 63.57 grams, a piece of copper about the size of a large marble, and a gram-molecule of hydrogen under normal conditions measures 22.39 litres, or a little less than a cubic foot.

This ingenious and quite satisfactory scheme of the chemist to get over this difficulty naturally suggests that a similar method might be used to establish a substantial, workable, "life-size" electron. Fortunately a simple relation exists which makes this quite practical.

It is known from Faraday's law that an atom of every element requires exactly the same quantity of electricity to oxidise or reduce it electrochemically per unit change of valence, hence the gain or loss of the same number of electrons, whatever that number is. For the chemist's enlarged, practical gram-atom, it is known definitely that this quantity is equal to 96,494 coulombs or 26.80 ampere-hours, which is also a substantial, easily measured quantity, and like the gram-atom requires no straining of the imagination to conceive it; it is, in fact, a very large amount for a gram-atom to carry when we conceive that it means a charge which could cause a steady flow of nearly 27 amperes for one hour. This constant quantity has received the name of a faraday and is now beginning to be referred to in literature by that name.

It will be seen, therefore, that if the constant (the unknown) quantity of electricity which is gained or lost when one real atom is oxidised or reduced electrochemically, be multiplied by the same (unknown) number that the real atoms have been multiplied by to make the practical gram-atoms, it will be equal to the faraday. Hence this definite quantity of electricity (the faraday) is obtained quantitatively in exactly the same way from the minute, unknown quantities of electricity, as the definite quantity of matter (the gram-atom) is obtained from the minute, unknown quantity of matter in a real atom, thus deducing a real, definite, substantial quantity from the realm of the unknown and inconceivable. Even another unknown quantity is eliminated thereby, namely, the number of real electrons which a real atom gains or loses in being oxidised or reduced; this need not be known either in establishing these substantial, workable units in this way.

The faraday may, therefore, quite consistently and correctly be called a *gram-atom-electron*, or enlarged electron, or popularly, a life-size electron, and with this understanding this enlarged electron can be rationally and correctly used in calculations and in literature; and as its size is so inconceivably larger than the real electron, no confusion could ever arise in the intelligent mind as to whether the real or the enlarged electron is meant if the latter is referred to more briefly as an electron, just as the chemist may, and often does, refer briefly to the atom when he really means the enlarged gram-atom.

Thus it is quantitatively correct to say that a gram-atom of hydrogen (1.008 grams) loses one enlarged electron (one faraday, or 26.8 ampere-hours) on being reduced, or that one gram-atom of iron (55.84 grams) gains three enlarged electrons (3 faradays or 80.4 ampere-hours) on being oxidised from iron to the ferric state. Each of the + and - signs often placed over the symbols of atoms showing the free charges carried after dissociation, and every unit of valence, therefore, represents an enlarged electron of one faraday if the symbol represents a gram-atom. Similarly, each bond then represents quantitatively the attraction of one negative faraday or enlarged electron on one element to one positive electron on the other.

Whether chemical reduction is a loss of negative electrons, as stated above, or a gain, is perhaps still controversial, and not yet proved physically; whichever it is, oxidation is the exact reverse; this does not affect what has been said above about the quantity of the enlarged electron, but merely the direction of its flow.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Induction Methods of Fault Localisation.

Having read with interest Mr. H. E. Blake's article in your issue of June 15th on the above subject, I should like to make a few remarks.

With a medical coil on a high-resistance fault one has to connect the secondary to the faulty cable, but on a low-resistance fault, or when locating the position of a buried cable, the primary connected up instead is very much louder.

A clearer sound is obtained with a condenser shunted across the telephone receiver.

I find that ordinary watch telephone receivers are quite satisfactory if the search coil is wound to get maximum sound with the receivers you intend using. A good method in winding is to bring out the ends of the various layers, and then experiment by connecting them in series or parallel.

You should be able to hear the hum (or tap, using a single-stroke arc-interrupter) with the receivers held slightly away from the ears. I think a search-coil with a 3-ft. base is most suitable, not so cumbersome, and brings the location of the fault within that length.

I have made a coil with a base of 1 ft. 4 in., which has enabled me to mark out faults within that length; also, it is handy for using on cables inside draw-boxes where cables are laid on that system.

While on the subject of fault localisation, I would like to mention that in this district we now and again have cables drawn apart $\frac{1}{2}$ to $\frac{3}{4}$ in. at joints due to mining subsidence. I have wondered whether it would hurt a good cable to connect the secondary of a petrol engine type ignition coil to one end of the open-circuited cable and earth the other end, thereby obtaining a spark-gap at the drawn-out joint.

If not detrimental to the cable, would it be feasible, with the aid of a wireless coherer, detector, or other instrument, to go over the surface where each cable joint is situated, and locate the sparking-gap joint?

North Staffs.

Lanu, July 2nd, 1917.

Electro-Culture.

With reference to your leading article in last week's issue, can any reader say why some form of Armstrong's machine for developing frictional electricity, by means of effluent steam, should not be used for charging the field network? The escaping steam would not be objectionable in open situations.

Leslie Miller.

London, E.C., July 2nd, 1917.

LEGAL.

THE ELECTRIC LIGHTING OF CHIPPING WYCOMBE.

IN the King's Bench Division on Tuesday last, before Mr. Justice Bailhache, an action was brought by the Wycombe Borough Electric Light and Power Co., Ltd., to recover £1,290 under an agreement for public lighting from the Mayor and Burgesses of Chipping Wycombe, and there was a counterclaim.

Counsel for the plaintiffs, Mr. E. Pollock, K.C., and Mr. C. R. Dunlop; for the defendants, Mr. J. B. Matthews and Mr. A. E. Hughes.

MR. POLLOCK, K.C., in laying the plaintiffs' case before the Court, said they claimed £1,290 under an agreement, dated October 3rd, 1911, for electric current for, and maintenance and repair, and renewal and cleaning of, electric lamps used in the street lighting of the Borough of Chipping Wycombe. There were due four quarters' instalments, the amounts being £332 10s. each, and the plaintiffs further claimed interest at the rate of £4 per cent. per annum from the date of the writ to judgment.

The defendant Corporation denied that £1,290, or any part of that sum, was due to the plaintiffs under the agreement, by which it was provided that payment should only be made in respect of each lamp lighted, at the rate of £13 per annum for each arc lamp, and £3 per annum for each wire lamp. The number of lamps lighted during the period referred to in 1916, and the times when they were so lighted, and the amounts payable, were stated, the total being £86 15s. 2d. It was provided in the agreement that if the lamps should not be lighted the defendants should be at liberty to deduct from any payment 3s. per night for each arc lamp, and 8d. per night for each wire or other lamp. The number and description of lamps which remained unlighted during 1916 were stated, and the defendant Corporation claimed to be entitled to deduct from the payments to the plaintiffs, under the agreement, a sum in excess of the £1,290 mentioned in the statement of claim, and pleaded that the statement of claim did not disclose any cause of action. It was an implied term of the agreement that the plaintiffs should only receive remuneration in respect of each lamp actually lighted. The non-lighting was due to the Defence of the Realm Act, by which lighting was made impossible, and the defendants were thereby discharged from their obligations, and the provisions had thereby become unenforceable by the plaintiffs as against the defendants.

MR. POLLOCK then dealt with the legal aspects, especially mentioning the Leiston case in support of the plaintiffs' claim, and said they were entitled to recover the full amount.

MR. MATTHEWS, for the defendant Corporation, dealt seriatim with the provisions in the agreement, and said that there was no obligation on the part of the defendants to pay anything except in respect of each lamp lighted; therefore, nothing could turn on the penalty clause. The contract was not to be regarded as having been frustrated by the conditions which had arisen. The defendants treated the contract as being still in force, and under it he submitted that they were liable only for the lamps lighted, and

that they were legally in a position to deduct for those lamps which had been unlighted.

MR. JUSTICE BAILHACHE, in giving judgment, said the case would have been interesting but for the fact that a somewhat similar case had been before the Court of Appeal—he referred to the action brought against the Leiston Urban District Council by the Leiston Gas Co. There was not much to distinguish between the two cases. Reading the Wycombe "penalty clause" in connection with Clause 7 and the end of Clause 3, he was satisfied that the words "from any cause whatever" were, in fact, limited to causes over which the electric lighting company had control; limited, in fact, to cases of default or neglect on the part of that company. There was no distinction in that respect from the Leiston penalty clause. In the Leiston case the decision of the Court of Appeal was made clear, and it was binding on him. He, therefore, must give judgment for the plaintiffs for the full amount claimed, with costs.

MR. MATTHEWS asked for a stay of execution, on payment of costs into Court.

MR. POLLOCK said that if the defendants would agree to pay interest on the money he would consent to a stay of execution.

MR. JUSTICE BAILHACHE: Very well; then there will be judgment for the plaintiffs for £1,200, with interest from the date of the issue of the writ.

LIGHTING RESTRICTION ORDER.

THE Stalybridge, Hyde, Mossley, and Dukinfield Tramways and Electricity Board were fined 40s. by the Stalybridge Magistrates, on Monday, for failing to shade or reduce the lights at the generating station on June 19th. It was stated that the Board had obtained an exemption under the Lighting Restriction Order on complying with the condition that a responsible person was in constant attendance to answer telephone calls within 15 seconds. On June 19th the defendants failed to respond to a call made for the purpose of receiving a test message issued by the Field-Marshal Commanding-in-Chief Home Forces (Lord French). The defence was that there was something wrong with the relay connected with the telephone system.

WAR ITEMS.

Shipping After the War.—With reference to arrangements that were recently being entered into in certain cases for the charter of British vessels for use after the war, the Ministry of Shipping has announced that it thinks it desirable to warn all concerned that they can have no assurance that national requirements will admit of effect being given to such arrangements when the time comes.

Carbon Imports Prohibited.—A Proclamation dated June 28th prohibits the importation of the following into the United Kingdom, save those imported under Board of Trade licence:—

Carbons for arc lamps; carbons for searchlights; cartridges of all kinds and parts thereof; electric dry cells and carbons therefor.

South African Engineers' Corps.—Mr. Mason, chief mechanical and electrical assistant engineer of the Rand Water Board, who has seen service in German East Africa, has been appointed to the command of a Miscellaneous Trades Corps for Europe. The strength of the corps is 232, and the age limit 52 years. The corps will consist of boiler-makers, fitters, trimmers, pipe-fitters, carpenters, platelayers, and the like.

Excess Profits.—In the House of Commons, Sir Francis Lowe asked the Chancellor of the Exchequer whether in computing the excess profits tax he would recognise the claims of those who had sunk capital in developing industries to have the amount so expended by them added to their other capital expenditure in estimating their pre-war standard of profits.—MR. BONAR LAW replied: In computing capital for the purposes of the excess profits duty account is taken under existing law of proprietors' capital employed in the business. A return on unremunerative capital invested during the standard years is also provided for by section 41 (4) of the Finance (No. 2) Act, 1915.—*Financial Times*.

American Comment on the Rising Cost of Materials.—The *Electric Light*, of New York, comments editorially on the situation in its June issue thus: "Those of us who eat to live know only too well how the cost of foodstuffs is climbing. Even dog biscuit is soaring, and that despite the fact that virtually no demand for it comes from dogs. The old economic axiom of supply and demand seems to play fast and loose when there's a war on. The supplies appear though to come along somehow whenever a dollar is fished out of a pocket that formerly held but 50 cents. If anyone doubts the truth of this statement let him ask the manager of any public utility, say the manager of a power plant or an electric railway. He will tell you how much the cost of labour, coal, oil, cotton waste and repair parts has gone up since Germany started out to sit in the sun. The railway man says it takes about two fares to buy what could be had for one fare in antebellum days. He can get the stuff, but

he must have more fares. Judging from our own experience with dog biscuit and other things, we guess the railway man is right. He wants more revenue from his property to help him pay his mounting bills, so he has asked the public service commission hereabouts to let him tack on a charge of a couple of cents for transfers. If he wins the commission over to his side, the people will stop transferring and take to walking; if he doesn't win, his railway is headed for bankruptcy. In either event, his lot is not an enviable one."

Bad Time-keeping.—The Ministry of Munitions is putting into effect the provision made in the Schedule of Protected Occupations, M.M. 130, for withdrawing protection from recruitment on account of bad time-keeping from men engaged on Admiralty, War Office, or munitions work. The following procedure is being adopted:—

1. Allegations of bad time-keeping will in the first instance be investigated on the spot by the Local Representative of the Admiralty or the Ministry of Munitions. If he considers that the case is a serious one, he will send a report on it to the Admiralty or to the Ministry of Munitions, as the case may be, who, if they consider that further action should be taken, will refer the case to the Local Enlistments Complaints Committee for the Division in which the man is employed in order that they may report upon it. The Committee will be instructed in all cases to hear the man personally before making their report, and, if he wishes it, to hear also the Branch Secretary or other representative of his Trade Union. They will also communicate with the employer if he makes representations to them, or if they consider it desirable. On receiving the report from the Committee, the Admiralty, or Ministry of Munitions, as the case may be, will decide whether the case is sufficiently serious to warrant the withdrawal of protection under the Schedule.

2. Sickness or other reasonable cause will be taken into account in deciding whether the case is one where protection should be withdrawn.

3. In the case of men employed in controlled establishments, the question of the withdrawal of protection for bad time-keeping will not ordinarily be considered unless the man concerned has been previously convicted of bad time-keeping by a Munitions Tribunal and has subsequently failed to improve.

4. The procedure set out above will apply to men in non-controlled as well as controlled firms; but in the case of non-controlled firms, the preliminary of prosecution before a tribunal will not be practicable.

Exemption Applications.—Dover Tribunal has granted four months' exemption to G. F. Howard (34, C1), a fitter in the Corporation tramway department.

At Aldershot, Mr. Vertue, electrical engineer, appealed for W. G. Hubbard (36, C2), mechanic, who, he contended, was doing better service in his present employment than he would be as a soldier. The appeal was dismissed on the understanding that the Military would use the man as a substitute.

At Gillingham (Kent), Mr. A. D. Chalmers, borough electrical engineer, appealed for W. A. Macdonald Paton (19), electrical engineer, and said that he had done all he could to replace him. Exemption pending substitution was granted.

On a Military appeal, exemption to November 1st, allowed by Gloucester Rural Tribunal to the electrical engineer at a local private asylum, has been reduced to July 15th, and made final.

At Gloucester, the Military appealed against conditional exemption granted to two motormen (36 and 34, Class C2) on the Corporation tramways, on the ground that they were engaged in one of the public services included in the list of certified occupations. The general manager (Mr. F. H. Corson) said that they had cut down the services to the lowest consistent with public requirements. The appeals were allowed, and the calling-up notice was fixed for July 31st.

The Central Appeal Court has dismissed an appeal in respect of Mr. L. Marshall, manager of the Taunton Tramway Co., Ltd.

Lepton Tribunal have allowed a Military appeal against exemption held by T. D. Linder (27), fitter and turner with the Hart Accumulator Co.

The Isle of Thanet Tramway & Lighting Co. appealed, at Broadstairs, for four men engaged on the tramways. The manager (Mr. Forde) said that the men concerned were indispensable to the proper working of the undertaking, which was decidedly one of public utility. He had released other men passed for general service, though they had been granted conditional exemption, and he was quite prepared to release these men if satisfactory substitutes could be provided, but it was no good sending him a draper or a tailor. At the beginning of the substitution scheme they sent him a man who, he should think, had never been inside an engineering shop. Conditional exemption was granted in each case.

On a review, Folkestone Tribunal has renewed conditional exemption held by F. J. Robinson (34, Class C1), electrician at the Pavilion Hotel.

At Folkestone, the Electric Light Co. applied for two months' exemption for W. V. Baker, meter reader and account collector, to enable a substitute to be trained. The request was granted.

At Lincoln, exemption was claimed by Mr. Gregory, electrician, for his wireman, placed, after rejection, in Class B2. He said that he had in hand an important contract under licence from the Ministry of Munitions. Three months were contended.

At Maidstone, three months' exemption has been allowed to Mr. W. T. Lambert (39), manager of the Corporation tramways, and H. Hayes and C. Hudson, coal unloaders at the Corporation electricity works.

At Ryde, exemption was claimed by P. G. Churchill (22, Class A), stoker at the works of the Isle of Wight Electric Light Co. It transpired that Churchill had been rejected from both the Army and Navy, and the company engaged him in consequence. Exemption until January 1st was granted.

A Military appeal was made at Ryde (Isle of Wight) against

exemption held by F. A. White (26, Class A), electrical fitter with the Isle of Wight Electric Light Co. It was urged that White was in a reserved occupation, but the Military Representative contended that there was no reservation at all. It transpired that by a new regulation anyone at a generating station was exempt, and the Tribunal decided that White was in a reserved occupation, and confirmed their previous decision.

At Burnley Tribunal, Mr. Mozley, tramways manager, appealed for the senior conductor and checker, aged 39 and married, passed C 2. The Town Clerk stated that such men were not now certified. Mr. Parker (Military Representative) had no objection to a temporary short exemption. Mr. Mozley asked if they could be allowed to retain the man until the busy season was over. He was given to September 30th (open).

At Southwark, Com. T. E. Hewitt, who is a member of the Tribunal, and carries on business as an electrical engineer in the borough, applied for the further exemption of three metal workers, 28, 27, and 23 years old respectively, all passed for general service. He stated that before the war he employed 17 men, but had now only these three men left. They were engaged on making metal parts for the R.A.C.D., whilst the Minister of Munitions had taken over certain premises in South Wales, and had called upon him to light them up at once. He was also engaged on installing the electric light at Red Cross Hospitals. If he could get men to take the places of these employees he should be glad to release them, but they were engaged on work of extreme national importance, and they were behind with their deliveries. They were granted a month's exemption each.

LOW-TEMPERATURE ELECTRO-THERMAL PROCESSES.

A PAPER read by Mr. C. F. Hirshfeld, chief of the Research Department of the Detroit Edison Co., before the American Electro-Chemical Society, was recently reported in *Metallurgical and Chemical Engineering*. The author said that, in a general sense, the electric furnace could not be considered a commercial competitor of furnaces heated by combustion. The use of the electric furnace must make possible the attainment of something unattainable by combustion methods, or else there was no possibility of its being used in place of the older type excepting, possibly, under very unusual conditions as to the relative costs of fuel and electrical energy.

There were certain low-temperature processes which, under certain circumstances, could be conducted to better commercial advantage by means of electric heating than was possible by means of combustion heating. The term "low temperature" might be taken as referring to temperatures below about 290° C. (554° F.). Such temperatures were below practically all commercial metal-melting temperatures, but were common in numerous baking and drying operations, which formed a surprisingly large part of industrial processes.

During the past few years the use of electric heating for such temperatures had been adopted in cases calling for the installation of equipments with capacities ranging from several hundred to several thousand kilowatts.

The best example of the extensive adoption of electric heating for low-temperature work was furnished by the electric japanning equipment installed during the past few years. The word japan was used as a sort of collective title for a number of paint-like materials intended to be baked at various temperatures between 100° C. (212° F.) and 260° C. (500° F.) for decorative or protective coatings on metal objects.

When electric baking of japan was first considered a few years ago, it was found that practically all japanning practice was of an empirical character. Makers of japans practically all agreed upon certain rules and regulations, but there was a large mass of so-called trade secrets which were, partly or wholly, mutually contradictory; operators were hired on the basis of a self-advertised collection of rules of thumb, combined with imaginary charms of various sorts for ensuring excellent results. The executive responsible for factory production were entirely at the mercy of these self-styled experts. It was not surprising that, under such conditions, the japanning room should have been a source of constant worry. In many establishments an average rejection of as much as 10 per cent. of the finished work was regarded as a characteristic of japanning processes, and was taken as a matter of course. The methods in vogue made it so impossible to control the essential variables that little opportunity existed for studying in the field the effects produced by giving them different values.

The application of electric heating to this art served the very useful purpose of making it possible to control accurately some of the variables, and the combination of electric heating with the continuous methods which were introduced with it made this control more extensive and automatic. With the combination of electric heating and continuous types of oven as now built, it was possible to control accurately and automatically all of the variables. Therefore, if one piece of work was satisfactory all must be satisfactory, if they came to the japanning room in the same state of preparation and if they had the same characteristics as to quality of material, contour, distribution of mass, &c.

Much of the credit for the control attainable with electric

heating must be given to the mobility of electric heating units. They could be shifted about with great ease until that particular arrangement which gave the best temperature distribution and best temperature gradient was discovered. After they were once located in such positions, the results attained were independent of all of the variable characteristics of combustion processes. Their performance must be the same not only day after day, but even year after year.

The ease and certainty with which electric heating units could be controlled automatically must also be given its full share of credit. The human factor, with all of its inherent tendency toward forgetfulness and toward variation from time to time, was absolutely eliminated by this method.

Since the introduction of continuous electrical methods it had been possible to make semi-scientific investigations in the industrial field, and several notable pieces of work had been done along these lines. As a result of one such investigation, the japanning in one large plant had been reduced to what was practically an absolute basis. In this case practically everything was controlled automatically, and one individual located in front of an instrument board some distance from the ovens and out of sight of all operations had general supervision of the entire process, and was responsible for results.

At the time when electrification started it was customary to bake japan in direct-fired gas ovens, in most plants. In these ovens gas was burned within the space in which the work was enclosed, and the products of combustion baked the work during the entire process. It was found to be particularly difficult to be sure of obtaining a high gloss, and the weathering qualities of work made under what were supposed to be exactly similar conditions were remarkably diverse.

Photomicrographs showing typical structures resulting from baking japan were given in the paper. It was shown that from baking japan slowly in a direct-fired gas oven the formation of small craters resulted, which seemed to be typical of all baking methods in which the heating was done by means of hot gases bathing the work.

On the other hand, photomicrographs of work done in electric japanning ovens under otherwise identical connections, show that the electrically-baked piece had smaller and more evenly distributed craters, and that the surface was more perfect. The baking of the coats in the gas oven consumed a total of 5½ hours, while the three corresponding coats were baked electrically in 2 hours and 40 minutes. Inspection of pieces baked in direct-fired gas ovens, and similar pieces baked in electrically-heated ovens, always showed that the electrically-baked material had a higher and more perfect gloss or finish.

Practically all heat transferred to the work in a direct-fired gas oven was carried to it by convection. In an electrically-heated oven at least part of the heat was brought to the work in the same way; the rest of the heat was transferred by radiation from the heaters, and it seemed probable that the action of the heat received in this way was different from that received by convection. It was at least probable that radiant energy penetrated the japan coat to a considerable depth before being entirely absorbed and converted into heat, and this caused more rapid setting of the inner portions of that coat.

If the craters were due to the causes assumed above, it should be possible to eliminate them entirely by baking the japan from the inside out. This could be done electrically by heating the metal itself, either by the direct passage of current or by induced eddy currents.

Certain experiments were conducted on a small scale, and inspection showed the sample baked by convection heating to have the poorest surface, while that baked by internal heating very obviously had the highest gloss and most perfect surface. Baking by internal heating was essentially an electrical method, far removed in every way from methods previously in use. With this method a maximum metal temperature of the order of 170° C. (338 F.) and a bake of 15 minutes were perfectly capable of giving better results than could be obtained with external electric heating with 45-minute bake and a maximum temperature of 230° C. (446° F.). It seemed probable that one coat baked in this way would prove the equal of two or three baked by the older methods. The effect of all this upon energy charges for a given weight of metal baked was obvious.

An equally promising field existed in foundry core rooms. The baking of foundry cores was a most haphazard process in the majority of foundries. Preliminary experiments conducted for the purpose of discovering whether the essential properties of cores varied as greatly as their colours gave astounding results.

There were now in operation several electrically-heated core-baking ovens, and their users all appeared highly enthusiastic over the results attained.

There were numerous other low-temperature baking processes, and the majority were in the same undeveloped state as the two cited above. One very important field in which little had been done was the baking of foodstuffs, such as bread and other cereal products. Electric heating had been applied to the baking of such materials in several cases with very gratifying results, improving both the appearance and quality of the product.

The introduction of electrical methods for such purposes as enumerated above should be of particular interest to the chemist, because it made it possible to reproduce on an industrial scale a sequence of operations and conditions which had been worked out on a small scale in the laboratory; it made it possible to control industrial production to the same extent that laboratory investigations were controllable, and thus opened to the chemist in the industrial field a tremendous opportunity for improvement of product and increased production.

Prof. Hirshfeld's paper elicited a long and animated discussion. In his final reply, Prof. Hirshfeld emphasised that the cost of energy was by no means necessarily the vital point. Ten years ago japanning was done by coal and coke firing. The change to gas heating involved an energy differential of 18 to 1, but the higher cost of the gas was considered of minor importance. Why not now change to electric heating, where the differential was so many times smaller than in the former case?

BUSINESS NOTES.

Book Notices.—*Scholey's Magazine*, which was suspended at the outbreak of the war, is now being re-issued. The June number is largely devoted to the question of efficiency, which is being closely studied by industrial and labour leaders. Efficiency in the boiler house, where perhaps the greatest economies can be effected, is the main feature of the issue, which can be obtained from Messrs. Scholey & Co., Ltd., price 2d.

Vol. XII of the *Proceedings* of the Roebury Engineering Society for the session 1914-15 has recently been issued, the delay being due to the war. It contains papers on "Modern Electric Lighting," by H. C. Wheat; "Modern Condensing Plant Systems," by T. R. Houston; and "Deep Well Boring," by — Sahl; as well as a list of members and other domestic information.

We have received a copy of No. 7 of *Russia*, an illustrated magazine of Anglo-Russian trade, published by Messrs. R. Martens and Co., Ltd. (Development Department), 149, Leadenhall Street, E.C. 3.

The *Central* for June contains articles on "A New Form of X-ray Localiser," by F. F. Renwick; "The Human Element in Industry," by "Works Manager"; "With a Field Company in Picardy," by R.O.B.; and "Arthur's Pass Tunnel, N.Z.," by E. L. Gosset; as well as numerous "Old Student Notes" and additions to the Roll of Honour.

The second issue of the *M. and C. Apprentices' Magazine* has come to hand, rejoicing in the success of its predecessor. It contains many interesting articles and humorous, technical, and personal items.

Trade Announcements.—MESSRS. VERITYS, LTD., have taken new offices in Birmingham at Phoenix Chambers, Colmore Row. Telephone number unaltered: "Central 12."

MR. H. G. CRUSE announces that he is continuing the business of his late father, Mr. Cruse, electrician, of 37, New Road, Lewes (Sussex).

Swedish Trade in Canada.—According to a report from the Imperial Trade Correspondent at Toronto, quoted in the *Board of Trade Journal*, a Swedish Association of Canada (Svenska Forbundet i Canada) has been established, with offices in Montreal, for the purpose of bringing Swedish nationals in Canada into closer communication with each other for mutual benefit, and for furthering intercourse between Canada and Sweden. It is anticipated that for the present the activities of the Association will be largely confined to preparations for closer relations after the war.

Catalogues and Lists.—MESSRS. E. BENNIS & Co., LTD., 28, Victoria Street, London, S.W. 1.—New catalogue (28 pp.) admirably illustrated with half-tones and line drawings, dealing with their boiler-house elevators. A general description of their gravity bucket elevators is followed by some notes on the economy of small elevators, and on their self-starting and self-stopping device. Brief accounts are then given of plants installed by them for a number of well-known mills. Copies of the catalogue will be forwarded on application.

MR. G. WYTHRICH, of Oswaldestre House, Norfolk Street, London, W.C. 2, sends us a 64-page booklet containing illustrations of a number of the principal specialties of the Oerlikon Co., also interior and exterior views of the company's works in Switzerland.

BRITISH INSULATED AND HELSBY CABLES, LTD., Prescott.—Twelve-page illustrated catalogue of the "Prescott" wiring system. The system and its component parts are described, and prices are tabulated for twin house wire, joint-boxes, bases, and distribution boxes.

Makers of all classes of electrical material are requested to send their catalogues to THE B.E. Co. (of London and Birmingham), LTD., 119, Mansion House Chambers, E.C. 1, for transmission to the firm's agent in Paris.

Change of Name.—MR. W. A. SCOTT (Messrs. W. A. Schultz & Co., chartered accountants) announces that he has by Deed Poll abandoned the name of Schultz, and adopted that of Scott. The style of the firm will be W. A. Scott & Co.

LIGHTING AND POWER NOTES.

Australia.—The Sydney Municipal Council Electric Lighting Committee has decided to dispose of a number of obsolete arc lamps, valued at £16,000, owing to carbons being unobtainable and to a more efficient lamp having been placed on the market.

Barrow.—The L.G.B. has suggested to the Health Committee the advisability of submitting its proposals for electrifying the sewage pumping plant as soon as practicable, in order to facilitate the granting of a loan for the work when the present restrictions are withdrawn.

Belfast.—PRICE INCREASE.—The Tramways and Electricity Committee has recommended that the present rate for electricity be increased by 4d. per unit from July 1st.

Bexhill-on-Sea.—Owing to the increase in the cost of service cables, the T.C. has decided that consumers shall in future pay for such part of the cable and laying as is beyond 40 ft. from the centre of the roadway.

Brighton.—YEAR'S WORKING.—The report of Mr. Christie, the manager of the electricity undertaking, to which we referred last week, points out that, owing to lighting restrictions, &c., nearly 2½ million units output had been lost as compared with normal times, but this had been largely compensated by power supply, for while lighting and power sales were about equal in pre-war times, they now had a ratio of 3 : 7. Coal cost 40s. 9½d. per ton, against 17s. 3d. in 1913-14, representing an increase in cost of £19,742; the average fuel costs for 1914 and 1917 were 37d. and 84d. per unit respectively. The consumers numbered 6,739, and 1,015 H.P. of motors were connected, 1,256 H.P. being hired. The maximum load was 4,312 kW., and the load factor 25.9 per cent.

Burnley.—PROPOSED LOAN.—An additional feeder cable being required for the Calder Vale district owing to the increasing demands for power purposes, the Electricity Committee has decided to ask the L.G.B. for powers to borrow £1,600, the estimated cost of laying the cable.

At its monthly meeting the Chamber of Commerce agreed to support the proposal for the better organisation of electrical supply for the benefit of industries.

Chester.—WATER POWER PROPOSALS.—The T.C. has decided to apply for a grant of £200 under the Development Fund Act, with a view to investigating the potentialities of the River Dee for hydro-electric development, with the object of supplying electricity to the agricultural and other rural industries of the county. The proposal has been favourably considered by the Board of Agriculture, and is referred to in a leaderette in this issue.

Continental.—FRANCE.—Prof. Glangcaud, of the Faculté des Sciences, at Clermont-Ferrand, has drawn attention to the natural wealth in the shape of water power, hydro-carbons, and carbonic acid of the Mont-Dore district in the centre of France. On the Dore River two electrical installations are working, with an aggregate capacity of 50,000 H.P., and two others are planned; but these are far below the capabilities of the river. Abundant petrol resources also, he says, abound in the volcanic ground of this district; while in the plain of Limagne, 300,000 kg. of natural carbonic acid exudes from the earth daily, and is unutilised. A closer co-operation of the Departmental technical engineers, scientists, and manufacturers is, the Professor thinks, needed in the interests of the country and of the electrical industries. Similarly with regard to lignite, France possesses extensive deposits, but only those of Aulépín, in Haute-Loire, are utilised, by means of German prisoners' labour, to provide local fuel, whereas at Giovanni d'Arno, in Italy, 200 tons per day are extracted for the production of electrical energy.

ITALY.—Conditions produced by the war have led to a discussion on the ability of Italy to find within herself sources of power for present and future industries. It appears that the only source of power which can be used to free the country from her dependence upon imports of foreign coal is the streams and torrents, which can be utilised for generating and transmitting electricity to a great part of the country; some of this work has already been done. Of the 800,000 hydro-H.P. in use on June 30th, 1914, it is estimated that 235,000 was in Piedmont, 225,000 in Lombardy, 10,500 in Liguria, 57,000 in Veneto, 5,500 in Emilia, 22,600 in Tuscany, 24,800 in Marche, 110,200 in Umbria, 32,000 in Lazio, 75,000 in Abruzzi e Molise, 7 in Sardinia, and the remainder in the Departments of Puglia, Basilicata, and Calabria. During the past year concessions that are expected to develop 200,000 H.P. have been granted. French and Italian engineers have estimated that from 4,000,000 to 5,000,000 water H.P. could be developed. If the mean of these estimates, 4,500,000 H.P. is taken as correct, and the 800,000 H.P. already developed is deducted, there remains 3,700,000 yet to be developed. To replace the energy obtained from imported coal used in railways and industries about 1,150,000 H.P. must be further deducted, leaving a surplus over all present uses of 2,550,000 H.P., or sufficient 16 more than double the power now in use in the country.—*United States of America Commerce Report*.

In a decree just issued the Ministry of War anticipates the expenditure of £1,000,000 on the utilisation of water power for the production of electrical energy and the working of the necessary plants. The expenditure embraces the acquisition of material as well as the cost of the additional labour.

SPAIN.—A concession has recently been granted for the establishment of a plant to utilise the water power of the River Guadalquivir, in the Province of Jaen, in the generation of electrical energy for lighting and power purposes.

Croydon.—The T.C. has decided to extend the mains to certain local works, at an estimated cost of £4,761. A garage for charging electric vehicles is to be provided at the electricity station, at an estimated cost of £550.

Dundalk.—The estimate of the Council's electrical engineer for the year ending in March, 1918, shows a deficit of £1,050, after meeting all working expenses and interest and sinking fund charges. This is due mainly to the high cost of fuel oil. In the circumstances it was decided by the Committee, and approved by the Council, to increase the price of energy for lighting purposes.

Finchley.—In commenting on the working of the electricity department during the past 12 months, the chairman of the Committee stated that coal cost over 26s. per ton, or 8 per cent. more than in the preceding year, and fuel oil cost £8 12s. per ton, or 140 per cent. more. Increased charges brought in £1,630 added revenue, but the fuel bill increased by £4,192. They used 4,071 tons of coal and 509 tons of oil, generating 1,345,000 units by coal at a cost of 1d. per unit, and 1,155,000 units by oil at a cost of 723d. per unit. The gross profit amounted to £10,630, equal to 12½ per cent. on the outstanding capital. It has been decided to further increase the charges for electricity for lighting and power.

Iford.—PROPOSED LOAN.—The U.D.C. has decided to apply to the L.G.B. for a loan of £5,800 for generating plant for the utilisation of steam at the refuse destructor works.

London.—KENSINGTON.—The Works Committee of the B.C. has agreed to a proposal by the Notting Hill Electric Lighting Co., Ltd., to increase the charge for electricity supplied for street lighting from 1d. to 1½d. per unit. The change is to come in at the end of the current quarter.

Maidenhead.—PRICE INCREASE.—The T.C. has advanced the price of current to ordinary consumers by 1d. per unit, and to power consumers by 10 per cent.

Manchester.—YEAR'S WORKING.—The annual statement of the Corporation electricity department for the year ended March 31st last shows a total income of £742,073, compared with £620,000 in the previous year; the net surplus was £62,889, as compared with £54,897. Of the surplus, £30,000 has been transferred to the rate account, £31,804 in payment of income-tax, and £1,085 for capital expenditure. The report states that one of the problems has been the maintenance of an adequate coal supply to the three generating stations. Arrangements have been made to still further increase the amount of coal carried in stock by the acquisition of further land for storage and the installation of mechanical appliances for handling coal. The average price paid for coal, taking the stations as a whole, rose 38d. per ton during the year, whilst the average weight of coal consumed fell 104 lb. per unit sold. A 5,000-kw. turbo-alternator has been completed at the Stuart Street station, also a high-pressure turbine for coupling up to a 4,500-kw. alternator. It is anticipated that a new 15,000-kw. turbo-alternator will be in commission by September, whilst a contract has recently been placed for a 20,000-kw. turbo-alternator. New or additional supplies have been, or shortly will be, furnished to 27 important consumers, principally through sub-stations installed on their own premises.—*Manchester Dispatch*.

Middleton.—YEAR'S WORKING.—There was a net loss of £1,605 on the working of the electricity undertaking for the past year.

Newcastle (Co. Down).—The U.D.C. has agreed to pay the Irish Towns Lighting Co. £230 per annum for nine months' public electric lighting for a period of three years.

Northampton.—PRICE INCREASE.—The Electric Light and Power Co. has, owing to the continued increase in the cost of production, temporarily advanced the price of current for all purposes by 10 per cent. as from the midsummer meter readings.

Perth.—WAGES.—The staff of the Corporation electricity station have received an additional 2s. on their weekly wages, in order to put them on a level with other Corporation departments.

Scunthorpe.—PROV. ORDER.—The U.D.C. has decided to apply at the earliest available opportunity to the B. of T. for a prov. order for electric supply. A prov. order obtained in 1903 was revoked five years later.

Shipley.—WAGES.—The Council has approved the Finance Committee's recommendation granting a further advance of 5s. per week on pre-war rates—making 12s. in all—on the pay of Council workmen, particularly in the electricity, gas, and highways departments. The advances are retrospective as from May 1st.

South Africa.—The Cape Town T.C. has decided to call for tenders for a motor-driven circulating pump, at an estimated cost of about £750.

Owing to the non-delivery of the additional boiler plant, and the inability of the electric light department to obtain suitable boiler tubes for the existing boilers, very drastic restrictions have had to be imposed on would-be consumers. All new connections, except for private houses, are prohibited, and no extensions either to lights, motors, or cooking are now allowed.

Uckfield.—PROV. ORDER.—The B. of T. has granted an extension for a further period of 12 months of the electricity order obtained by the Crowborough Gas Co.

TRAMWAY and RAILWAY NOTES.

Belfast.—At the monthly meeting of the Corporation on Monday last, Alderman Tyrell said that the tramway receipts continued to be satisfactory. The net revenue from the electricity undertaking was £5,697. The effect of the Daylight Savings Act was a saving of 1,300 units per day last winter. By the recent awards some 126 men employed at the Corporation tramway depot are to receive an increase of from 1s. 3d. to 1s. 6d. per day, according to age, in lieu of war bonuses. In the case of the employees who struck at the electricity station, an increase of 8s. to 11s. per week has been made, in lieu of war bonuses, according to age, the higher rate being for all over 18 and the lower rate for those under it.

Blackburn.—RAIL RENEWALS.—As a result of the intervention of the Ministry of Munitions, the Birmingham Corporation is supplying the Corporation with sufficient rails for the relaying of a worn-out portion of the track in Preston Old Road. It had been proposed to take rails from the Cherry Tree route, and discontinue that service, but the residents objected and sought Government help.

Burnley.—On Saturday morning the members of the Tramway Workers' Union decided to strike against overcrowding and working overtime. The strike was in progress until Saturday night, and was resumed on Sunday evening until the cars returned to the depot. It was not, however, resumed on Monday, when publicity was given to the following resolutions, adopted in Manchester on Sunday:—"That hostilities cease for the present, with a view to endeavouring to arrange a meeting with the Managers' Federation, as advised by Sir D. Shackleton"; "that no one be taught the duties of driver or conductor unless he or she was learning before the dispute commenced, or was at the time a member of our Association."

Canada.—An electric car on the Niagara Gorge route ran off the track at a washout, and fell into the river, 27 persons being reported killed and 40 injured.

Darwen.—The Tramways Committee, last week, declined to grant free passes on the cars to local Guardians attending board meetings at Blackburn. A request by the local special constables for free car passes was also refused.

Halifax.—With the consent of the Council, the Tramways Committee has authorised an option to purchase from it, on or before August 4th, at the price of £6,283, land and buildings at Highroad Well, originally used as a car shed.

RAIL RENEWALS.—The Tramways Committee proposes to relay North Bridge with new rails, such rails being at present in store. The borough engineer has been instructed to prepare a report as to the lengths of rails laid in streets not now used for the purpose of tramways, together with the cost of taking them up and relaying them where renewals are required.

Iford.—TRAMWAY LEASE.—With regard to the leasing of the Barking tramway track, a conference has been held between representatives of the two councils, and a provisional agreement has been arrived at to the effect that the existing lease be renewed for three years from June 1st, 1917, upon the same terms, with the exception that the annual rental be £1,250, and that the price for the purchase of current from the Barking Council be 1½d.

Keighley.—Arbitration proceedings were held, last week, in connection with the local tramway employees' demands which caused the recent strike. The employees asked for an advance of wages to correspond with the Bradford rate of pay for male and female workers, a war bonus of 6s. per week for males and females, and time and a-quarter for work on the seventh day. The proceedings lasted about two and a-half hours; the award will be announced later.

Sheerness.—The U.D.C. has decided not to entertain an offer to purchase the undertaking of the Sheerness and District Electric Power and Traction Co. The company has informed the Council that it intends at an early date to close the service between Sheerness Pier and Cheyney Rock and Sheerness East, and to remove the rails, poles, and overhead equipment.

TELEGRAPH and TELEPHONE NOTES.

Japan.—Although the State telephone system is operated at a large profit, the Department has not been able to keep pace with the demand for connections, of which 134,300 were awaiting attention at the end of 1914; the result has been that persons urgently requiring connection have had to purchase from others their telephone rights at heavy cost. Each telephone in Tokio, on the average, makes 22 calls per day, an average more than double that prevailing even in New York, a flat rate of charge being in force.—*T. and T. Age*.

United States.—The New York Telephone Co. has completed the work of laying a large submarine telephone cable across Raritan Bay, a distance of nearly 5½ miles. It is said to be the

longest maximum size duplex submarine telephone cable at the present time. It contains 74 pairs of wires for regular telephone work and 12 pairs for testing purposes.

Mr. J. J. Carty, chief engineer of the American Telephone and Telegraph Co., has become a Major in the U.S. Signal Corps Reserve. The Bell telephone companies will form 25 signal corps reserve companies, a total of about 100 officers and 2,500 non-commissioned officers and men.—*T. and T. Age.*

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—**SYDNEY.**—August 22nd. N.S.W. Government Railways and Tramways. Thirty-six induction motors (Specification No. 488). September 19th.—One 225-H.P. synchronous motor (Specification No. 489). Particulars from Electrical Engineer's Office, 61, Hunter Street, Sydney.

Dublin.—July 16th. Electricity Supply Committee. Transformers for one year. See "Official Notices" to-day.

Edinburgh.—July 12th. Scottish National Housing Co., Ltd. Metal-filament lamps. See "Official Notices" to-day.

Glasgow.—Electricity Department. Boiler-house plant. E.H.T. switchgear (20,000 volts). See "Official Notices" June 15th.

Hull.—July 19th. T.C. Machinery oils for the electricity works and sub-stations. Mr. J. F. Magoris, Acting Electrical Engineer.

Manchester.—July 10th. Tramways Committee. (a) Cloth (beaver, serge and pilot); (b) block tin. Mr. J. M. McElroy, General Manager.

July 11th. Electricity Committee. Stuart Street station. High and low-pressure steam and feed pipework. Mr. F. E. Hughes, Secretary, Electricity Department.

Spain.—Tenders have recently been invited by the municipal authorities of Deva (Province of Guipuzcoa) for the concession for the electric lighting of the town during 10 years.

West Ham.—July 17th. Corporation. Two motor ambulance vehicles. See "Official Notices" to-day.

CLOSED.

Brighton.—The Lighting Committee recommends the acceptance of the offer of the Underfeed Stoker Co., Ltd., for three travelling grate mechanical stokers, at £3,087.

Manchester.—Electricity Committee. Accepted tenders:

Hydraulic accumulator and ram pump.—Hydraulic Engineering Co., Ltd.
Coal elevator.—W. J. Jenkins & Co., Ltd.
750-kw. converter.—B.T.H. Co., Ltd.
1,000-kw. rotary converter and transformer.—Mather & Platt, Ltd.
150-kw. rotary converter and transformer.—British Westinghouse E. & M. Co., Ltd.
300-kw. motor-converter.—Bruce Peebles & Co., Ltd.
Cables.—Callender's Cable & Construction Co., Ltd.; Liverpool Electric Cable Co., Ltd.; B.I. & Helsby Cables, Ltd.

Stores for 12 months. Accepted tenders:—

Adhesive tape.—L. Andrews & Co.
Dry batteries for flash-lamps.—Ward & Goldstone.
Box compound and Bittite tape.—Callender's Cable & Construction Co., Ltd.
Cast-iron cable troughing.—Coalbrookdale Co.
D.C.C. silk cord and Eureka wire.—London Electric Wire Co. and Smiths, Ltd.
Enamelled wire.—Connolly Bros., Ltd.
Insulators.—Bullers, Ltd.; Donlon & Co.; Gaskell & Grocott.
Lion jointing and packing.—J. Walker & Co., Ltd.
Nickel chrome and strip.—H. Wiggan & Co., Ltd.
Rubber tape.—L. Andrew & Co.; W. T. Henley's Telegraph Works Co., Ltd.; W. T. Glover & Co., Ltd.; C. Macintosh & Co., Ltd.
Service boxes.—J. Stubbs, Ltd.
Tinned steel and armature wire.—W. N. Brunton & Sons.
Auto-transformers and auto-balancers.—Brit. Elec. Transformer Co., Ltd.
Trifurcating boxes.—B.I. & Helsby Cables, Ltd.
Tubing and accessories.—Brotherton Tubes and Conduits, Ltd.
Tubing, &c. (Simplex).—Simplex Conduits, Ltd.

Salford.—Electricity Committee. Accepted tender:—
Cable.—Macintosh Cable Co., Ltd., £5,396.

FORTHCOMING EVENTS.

Salford Technical and Engineering Association.—Saturday, July 7th. Visit to Messrs. Royes, Ltd., Irlam.

Birmingham and District Electric Club.—Saturday, July 14th. Visit, in conjunction with the Association of Mining Electrical Engineers, Warwickshire and Staffordshire Branch, to the Walsall Corporation generating station at Birchills.

OUR HALF-YEARLY INDEX.

THE Index to Vol. 80 of the ELECTRICAL REVIEW has now been printed. As already announced, it will not be distributed with the journal, owing to the need for effecting paper economy. Copies will be supplied for 3d., post free, to those who make special application for it. Readers and others who require copies for binding the half-yearly volume, or for keeping together with their loose copies, should make application at once to the Publisher, ELECTRICAL REVIEW, 4, Ludgate Hill, London, E.C. 4.

NOTES.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W.

Orders for the week, by Lieut.-Colonel C. B. Clay, V.D., commanding:—
Monday, July 9th.—Technical instruction for No. 3 Company, Right Half Company, at Regency Street. Drill, No. 3 Company, Left Half Company. Signalling Class. Recruits' Drill, 6.30.

Tuesday, July 10th.—Lecture, 6.30. Physical drill and bayonet fighting, 7.30.

Wednesday, July 11th.—Drill, No. 1 Company, Right Half Company.

Thursday, July 12th.—Drill, No. 2 Company, Right Half Company. Ambulance Class, 6.30. Signalling Class.

Friday, July 13th.—Technical instruction for No. 3 Company, Left Half Company, at Regency Street. Drill, No. 3 Company, Right Half Company. Recruits' Drill, 6.30.

Saturday, July 14th.—C.O.'s Parade, 2.45. Uniform, for Drill in Hyde Park. MACLEOD YEARSLEY, Adjutant.

The Aluminium Resources of the Empire.—As a result of inquiries made as to the position of aluminium production in the Empire, the British Empire Producers' Organisation learns that, notwithstanding the fact that some of the best deposits of bauxite—the ore from which aluminium is extracted—are in foreign territory, namely, in France and the United States, the British Empire has an important place amongst the world's producers of this metal, and is likely to hold it. The best British deposits of bauxite are in Co. Antrim, Ireland, whence the ore is sent to the aluminium works at Foyers and Kinlochleven, in Scotland, where the output of metal is now well over 10,000 tons a year. Canada also manufactures nearly as much at Shawinigan Falls, in Quebec Province, from bauxite imported from the United States. A lease of some of the bauxite deposits recently proved in British Guiana has been granted to the company owning these Canadian works on condition that within seven years it establishes in British territory refining works capable of producing about 4,000 tons of aluminium per annum. Large deposits of bauxite which could be worked by simple quarrying are awaiting development in the Central Provinces of India. This bauxite could hardly be exported from India at a profit, but it might be treated on the spot for the extraction of alumina for export, and possibly aluminium might ultimately be made in India. The British Empire already has a good share in the world's production of this metal, and also has large reserves of the raw material upon which it can draw in due course.

National Insurance (Unemployment) Acts, 1911 to 1916.

Contributions are payable in respect of:—

2,325 X. Workmen engaged wholly or mainly in fitting up cast-iron fuse-boxes, such as are commonly used for ordinary domestic installations.

2,327 X. Workmen employed by firms of tube makers, and engaged wholly or mainly in tagging, skimming or bell-mouthing tubes for the automobile industry.

The Fixation of Nitrogen in Germany.—The production of ammonia by the Haber synthetic process rose from 30,000 tons in 1913 to 60,000 tons in 1914, 150,000 tons in 1915, and 300,000 tons (estimated) in 1916. An output of 500,000 tons of ammonia is anticipated in 1917, containing 100,000 tons of nitrogen; at the same time 700,000 tons of sulphate of ammonia (140,000 tons of nitrogen), and 400,000 tons of calcium nitrate (80,000 tons of nitrogen) are expected to be produced, the total including 320,000 tons of nitrogen, which exceeds by 100,000 tons the entire consumption of nitrogen in Germany in 1913. *La Revue Générale de l'Electricité*, from which we derive these figures, originally published in the *Frankfurter Zeitung*, makes reservations with regard to their accuracy.

Summer Time.—The U.S. Senate has passed a Daylight Saving Bill, with an amendment to make it take effect next year. The measure is now before the House of Representatives.

With a view to economy in fuel, the Provisional Government has decided, beginning on July 14th, to advance the normal time by one hour throughout Russia.

Spain.—La Sociedad Anonima Productora de Fuerzas Motrices has been formed at Bilbao, with a capital of 6,400,000 pesetas, for the acquisition and utilisation of waterfalls, the manufacture and sale of materials for the electrical industries, and the acquisition and working of fuel, metal, and other deposits.

The company is the owner of a fall on the River Hannisell, province of Levida, where the installation is expected to be completed by the end of 1919.

Terms of Apprenticeship.—The need for the better industrial training of young workers and the question of apprenticeship as the most suitable method by which this can be obtained is at present being widely discussed by employers in all trades. The following recommendations on the arranging of apprenticeships have been drawn up by the Apprenticeship and Skilled Employment Association, which has had long experience of the actual apprenticing of boys and girls to employers in skilled trades. In framing these suggestions due regard has been had to the necessity of adjusting the old and too rigid apprenticeship system to answer the altered social and industrial conditions now obtaining:—

Length of Term.—A maximum period of five years. A seven years' apprenticeship, though upheld by many Trade Unions, is needlessly long, having regard to the present standard of education now reached by candidates for apprenticeship and the later age of attendance at school, and it undoubtedly operates as a deterrent in many cases.

Age at Commencement.—15 or 16 where it is possible for the boy to remain at school. For those leaving the Elementary Schools at 14 years of age, it is best that they should enter the works where they are to be apprenticed immediately on leaving school.

The Period of Trial.—before the indentures are signed—should be at least one month in length; a longer period is sometimes desirable. This period should be included in the term of apprenticeship. During this time the boy should be put on work which he will do when apprenticed, in order that his ability and liking for it may be tested. A wage should be paid during this period not greater than the wage during the first year of apprenticeship.

Wages must vary according to trade and locality, but should not compare so unfavourably with the wages paid to boys in unskilled trades as to deter poor parents from apprenticing their sons on purely financial grounds. Much talent which would have been of the greatest use to the nation has been lost through apprenticeship wages being so low that lads from poor homes, but with marked industrial gifts, have been unable to enter skilled trades.

Premiums should not be required; they have the same effect in keeping out poor boys as have low wages. If charged, the wages should be proportionately high.

A Bonus—payable at intervals for good time-keeping, behaviour, and work—is an incentive to the apprentice to do his best.

General and Technical Education at continuation classes should be arranged for and insisted on, especially in the case of apprentices who are bound at 14. Where possible this should be during working hours, in order that the apprentice may come fresh to the classes and get the utmost profit from them. Where this is not possible, some relaxation of hours should be allowed either on the afternoon of the day on which the class is to be held, or on the following morning. During the first two years of the apprenticeship the classes attended should be on subjects of general rather than technical education.

The Indentures must contain an undertaking by the employer to teach the trade, and by the apprentice to learn it, and must be signed by the parent, boy, and employer in the presence of a witness. Clauses should be included relating to all the above points, and to the hours of work, overtime, holidays, and payment during sickness. If an outside and impartial agency is interested in the apprentice it is an advantage that this agency should appoint a member to sign the indentures as a fourth party, and that the power of arbitration, and in the last resort cancellation, should be given him. This avoids recourse to a court of law in the event of any dispute between the employer and apprentice. An indenture must be stamped with a revenue stamp. A specimen form of indenture can be sent if desired, price 1½d post free.

Photoelectric Sensibility.—In the *Physical Review*, Mr. T. W. Case describes a systematic search for substances which show a change of resistance when exposed to light. The results of the author's research are given in a long table. Two specimens which show remarkable action are acicular crystals of bismuth sulphide (bismuthinite) and a granular lead antimony sulphide. The resistance of a piece of the latter 1 mm. × 10 mm. "reduces about 5,000 per cent." (*sic*) from the value in the dark in dull sunlight at an applied potential of 110 volts. If the substance be actually heated up, either by exposure to heat or passing a current which slowly heats the substance, then the resistance is gradually lowered, but this is a slow process. All of the photo-active sulphides show the quick light reaction in the red part of the spectrum. Both the bismuthinite and the lead antimony sulphide give fine results when used as a transmitter in a photophone system, using a manometric flame for transforming the voice variations into light variations. The voice reproduction is very clear and loud.—*Electrical World*.

Danger of Compressed Oxygen.—According to Mr. George S. Rice, Chief Mining Engineer of the Bureau of Mines, U.S.A., there has been a large number of explosions in various parts of the country of tanks containing oxygen made by the electrolytic process, due to the presence of hydrogen mixed with oxygen, and the Bureau has been making an investigation of this subject.

In general the findings of the Bureau are these:—That, strictly speaking, there is no spontaneous combustion, but in all cases where sufficient data have been obtained the oxygen has been used in conjunction with a torch for welding or cutting, and the flame has flashed back through the mixture. It is possible that ignition may occur by a jet of oxygen playing on carbonaceous material under certain special conditions; nevertheless, these conditions are

most unusual, as in many experimental tests made by the Bureau the jet could not be so arranged as to cause ignition, although there was a rise of temperature at a certain point and cooling due to expansion at a point beyond.

In all cases, however, the real danger is in the hydrogen getting into the oxygen, and it has been found that this is due to improper design in the manufacturing apparatus—that is, the cells and electrical connections; to insufficient safeguards connected with the electric apparatus, the polarity suddenly and unexpectedly shifting; to the manufacture of oxygen without frequent analyses; and to incompetent or ignorant attendants.

Unfortunately, certain makers of oxygen-manufacturing apparatus have advertised that any labourer can take care of their apparatus. It is believed that the manufacture of electrolytic oxygen can be carried on in a manner to make it entirely safe. In fact, there has to be over 9 per cent. of hydrogen with the oxygen to make an explosive mixture. Nevertheless, certain tanks from one batch caused three widely separated explosions in California, killing seven men in all, and an analysis of gas from a tank filled at the same time showed that it contained over 50 per cent. of hydrogen.—*American Machinist*.

Economy in Coal Consumption, and Inter-connection of Electricity Works.—The Controller of Coal Mines has been advised that an economy in the use of coal can be effected and much inconvenience avoided during the next and succeeding winters by giving effect as far as possible to the following suggestions:—

Power Users.—That the various factory owners throughout the country who at present generate their own power by means of coal should make arrangements for taking their power requirements from an outside source in districts where the power supplies have a margin available. The Coal Controller will assist as far as possible in obtaining priority for plant, machinery, and motors required, provided a substantial coal saving can be demonstrated.

Use of Coke.—The use of locally-produced coke or coke breeze in place of coal as much as possible in domestic grates, factory furnaces (where such cannot take an outside supply), public utility plants at light loads, also in baths and wash-houses, provided coke is available in sufficient quantities.

Public Services.—The curtailment of those public services which entail coal consumption, such as early and late tramway running—after consultation with the Ministry of Munitions, where munition workers are likely to be affected—and the prevention of unnecessary use of water.

Stocks.—The accumulation of stocks in the summer months, as far as deliveries will permit, of the coal required during the winter months, the cost of such storage being considered as a form of insurance against the probable coal shortage.

Cooking and Heating.—The installation of gas or electric cooking and heating appliances in public and private buildings, with a view to saving coal generally, and lessening the serious inconvenience to the public next winter should the local distribution of coal become irregular or insufficient.

Emergency Disconnection.—The application to the Board of Trade by the electric supply authority for sanction under Regulation B 1 to disconnect classes of non-essential consumers in cases of urgent necessity, in order to enable the supply to be continued to munition and other essential users. This power should be obtained, although it need not be put into execution until the necessity arises.

Interconnection.—Making arrangements as suggested in the letter of the Board of Trade dated May 25th, 1916, with the neighbouring towns to interconnect electric distribution systems or generating plants by means of underground cables, or in suitable cases of temporary overhead wires over the intervening country, so as to enable one or two of the most economical power stations in each district to supply several towns at light loads, instead of each town having to run its own power station uneconomically at such times. This would also enable the various power plants to shut down in turn during week-ends and holidays to effect plant repairs, and would provide some amount of power at call as a stand-by in case of coal supplies giving out locally.

In order to carry out the last suggestion, the Controller is advised that additional powers will have, in some cases, to be obtained as regards passing over private property, trading between public utility companies and local authorities, and possibly relief from some of the existing power supply regulations; and if cases are brought to his notice, they will receive his assistance where the saving in coal would warrant the provision of the necessary plant, mains, &c.

Regulation of Coal Prices.—The Controller of Coal Mines has issued a code of directions as to the sale of coal, with a view to dealing with fluctuations in colliery prices which have recently occurred in certain districts owing to abnormal market conditions, and preserving the regularity in the distribution of coal which is so necessary at the present time. The directions mainly affect prices of coal for export and bunker purposes, for which a definite schedule of prices has been drawn up, but they also provide that the prices of coal for home consumption shall remain at the maxima prescribed by the Price of Coal (Limitation) Act.

The Board of Trade Committee on Electricity Supply.—

We are informed by the Board of Trade that Sir A. Chibald Williamson, Bart., M.P., has consented to act as chairman of the Committee on Electric Power, in place of the Right Hon. F. Huth Jackson, who has resigned on medical grounds, and that the following representatives of local authorities owning electric supply undertakings have been added to the Committee, viz.:—Mr. W. B. Smith, Mr. Harold Dickinson, and Mr. E. F. Vesey Knox, K.C.

The Fixation of Nitrogen.—Plant is about to be erected at Manchester for the manufacture of nitrogenous products by means of an electrical process of British origin, the rights for which are owned by the International Nitrogen and Power Co. The installation is expected to be at work within six months.

Fatality.—At Bolton Electricity Works, on Sunday, a switchboard attendant named Hoarler was killed through coming into contact with a H.T. wire.

Institution and Lecture Notes.—Royal Society of Arts.—The annual general meeting was held on June 27th, Dr. Dugald Clerk, F.R.S., in the chair. H.R.H. the Duke of Connaught, K.G., was re-elected President of the Society, and amongst the new vice-presidents elected was Field-Marshal Sir Douglas Haig, who is a Fellow of the Society of over 20 years' standing. Sir Henry Trueman Wood was re-elected secretary, but it was announced that he had tendered his resignation to the Society, to date from September next. He has held the secretaryship since 1879.

Société Internationale des Electriciens.—In order to comply with legal requirements regarding societies recognised to be of public utility, the Société Internationale des Electriciens has revised its statutes, and has taken the opportunity to change its title to Société Française des Electriciens.

American Institute of Electrical Engineers.—The annual convention, which was to have been held in June, was cancelled on account of the national situation. Instead, a special meeting was to be held in New York on June 27th and 28th, at which the convention papers were to be presented and discussed.

Institute of Metals.—The Council announces that an extra election of members will take place on July 18th. Those desirous of applying for membership of the Institute are invited to write to the Secretary, 36, Victoria Street, S.W. 1, for a copy of the new membership booklet, which includes an up-to-date list of the Institute's 760 members. The membership of the Institute has recently shown a very considerable increase, more additions to the roll having been made during the past six months than in the previous three years. A new financial year of the Institute commences this month. The annual autumn meeting of the Institute of Metals will be held on Wednesday, September 19th, in the rooms of the Chemical Society, Burlington House, London, W. 1, when many interesting papers will be submitted for discussion.

Institution of Electrical Engineers.—The Committee of the Students' Section of the Institution of Electrical Engineers invites offers of papers from students of the Institution to be read during the coming session, between September, 1917, and May, 1918. Offers should be sent at once, with as much information as possible, to the Hon. Secretary of the Students' Section, Mr. A. W. Grace, "Evandale," Granville Road, Sidcup.

More than 3,000 Uses of Electricity.—The Society for Electrical Development (New York) has issued a booklet listing more than 3,000 applications of electricity, which has been sent free to its members. It is intended as a guide or reminder for sales managers, contractors and electric suppliers, and is one of a series to be issued in connection with the Society's "Keep Business Going" campaign.

Late Legal.—ELECTRIC TRAMWAY CO. SUED.—In the King's Bench Division, on Tuesday and Wednesday last, before Mr. Justice Avory and a Special Jury, an action was heard in which Mrs. E. M. Lloyd and Mr. G. W. Lloyd, of West Hendon, sued the Metropolitan Electric Tramways Co., Ltd., Mr. G. Simpson, of the Army Service Corps, Hounslow, and Mr. T. Owen, of Cricklewood, in respect of personal injuries sustained on June 27th, 1916, in Cricklewood Broadway, to the female plaintiff by reason of the alleged negligence of the various defendants. The male plaintiff sued in respect of the loss that had resulted to him by the occurrence. The case arose out of a collision between one of the Metropolitan Electric Tramway Co.'s cars and a motor lorry driven by Simpson, who, it was said, was being instructed in driving by the defendant Owen. Owen denied negligence, and Simpson said that the accident was the fault of the driver of the car. The Tramway Co. denied liability. A large body of evidence was called, and in the result the jury found for the plaintiff against Simpson and the Tramway Co. They found in favour of Owen. Judgment was given for the plaintiff for the agreed sum of £25 against Simpson and the Tramway Co. Judgment was given in favour of Owen, with costs.

CENTRIFUGAL FANS. PATENT REVOKED.—A petition for the revocation of a patent for a centrifugal fan was heard by Mr. Justice Sargant in the Chancery Division, on Tuesday. The petitioners were James Keith & Blackman Co., Ltd., the registered owners of patented inventions in connection with centrifugal fans for delivery of air and other gases under pressure. The patent attacked was Ralph Hancock's patent 21,353 of 1913. Mr. Moritz appeared for the petitioners, and there was no appearance for Mr. Hancock, who, it was stated, was in America.

Evidence having been given on behalf of the petitioners by Mr. Jas. Swinburne and Mr. Chas. Tuson, his Lordship said that there was not sufficient subject-matter to justify the grant of the English patent. Further, tests had been made by Mr. Swinburne and Mr. Tuson of a fan designed in accordance with the English specification of Hancock, as against the ordinary design by Keith, and it had been shown that the Hancock fan was less efficient than the Keith fan; and accordingly there was a presumption arising from that that there was no utility in the design. On the whole, his Lordship thought that he must grant this petition for revocation.

Electrolytic Smelting of Tin Ores.—H.M. Consul at Antofagasta, Chile, reports that experiments on a small scale in the electrolytic smelting of tin ore have been made in Bolivia. The tin extracted is stated to have been of high quality, but, owing to the prohibitive cost of production, the experiments did not indicate the possibility of commercial operation.

Fleet Street Memorial Service.—The Bishop of London will take the service at St. Bride's Church, Fleet Street, E.C., on Saturday, July 28th, which has been arranged by the committee of the Press Club in memory of the members, sons of members of the Press Club, and other Fleet Street journalists who have fallen in the war. Particulars will be announced later, and members and others who desire names to be included are asked to communicate with the Hon. Secretary, the Press Club, St. Bride's Passage, Salisbury Square, Fleet Street, E.C. 4.

Japanese Copper.—Japan ranks second only to the United States in the production of copper, and the Swedish Ambassador at Tokio and Pekin calls the attention of the Swedish College of Commerce to this fact, and to the need of knitting first-hand relations with Japanese producers and exporters, so as to escape the commissions exacted by middlemen in London, Hamburg, and Antwerp.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—Mr. E. S. RAYNER, the manager of the Doncaster electricity and tramway undertakings, a proposed increase of whose salary from £450 to £500 was recently rejected, after a heated debate, by a narrow margin of votes in the Council, is to leave Doncaster, by request of the Deputy-Controller of the Admiralty for an appointment under that department. Mr. Roberts, the deputy-engineer, is to take charge pending the Council's decision as to re-arrangement of work. Mr. Rayner's departure, owing to Admiralty demands, being practically immediate.

We regret to learn that Mr. PICKVANCE, electrical engineer to the Wrexham T.C., who had a motor accident some time ago, is ill, and will have to rest for a few weeks.

The Manchester Corporation Electricity Committee recommends that Mr. J. G. THOMSON be appointed boiler-house engineer at the Stuart Street station at a salary of £275, rising to £300, and that Mr. H. W. BRISTOW be appointed assistant boiler-house engineer at Stuart Street station at a salary of £200, rising to £225.

According to the *Daily Telegraph*, Mr. R. O. BALDWIN, traffic superintendent of the Bournemouth tramways, has been appointed general manager of the Exeter tramways.

Mr. J. T. FAYLE, traffic assistant to Leyton U.D.C., has been appointed traffic manager to the Southend Corporation tramways.

The following increases of salary have been given by the Bolton Town Council:—Mr. B. S. HORNBY, chief assistant electrical engineer, £250 to £280; Mr. H. E. ANNETT, generating station engineer, £250 to £280; Mr. E. JONES, chief clerk, electricity department, £150 to £170; Mr. E. R. JAMESON, assistant engineer, £140 to £150.

The L.C.C. Highways Committee recommends that as from July 15th next, Mr. E. W. DICKINSON, superintendent of the Greenwich generating station, be the power-station engineer, at a salary of £500, rising to £700 a year; that Mr. E. L. POPE, resident electrical superintendent (southern section), be the distribution engineer (southern section), and Mr. T. L. HORN, resident electrical superintendent (northern section), be the distribution engineer (northern section), both Mr. Pope and Mr. Horn at a commencing salary of £500, rising to £600 a year.

Inspector W. THOMAS, of the Walthamstow tramway staff, who is leaving for South Africa for the benefit of his health, has been presented by his colleagues with £80.

General.—The following appear in the new list of Civil List Pension awards:—

£100 to Mrs. Charlton Bastian, in consideration of the services to science of her late husband, Dr. Charlton Bastian, and of her straitened circumstances.

£75 to Mrs. Minchin, in consideration of the scientific work of her late husband, Prof. E. A. Minchin, and of her straitened circumstances.

Sir A. R. BINNIE, late chief engineer of the London County Council, who died on May 18th, aged 78, left property of the value of £10,335.

Mr. LAWFORD GRANT, who has been appointed managing director and treasurer of the Eugene F. Phillips Electrical Works, Ltd., Montreal, went to Canada in 1907 as president and managing director of the Canadian British Insulated Co., Ltd. In 1913 he accepted a position as assistant manager of the Phillips Co., and now succeeds Geo. H. Olney, who was the head of that firm for 18 years, Mr. Olney having recently retired owing to ill-health. Mr. Grant is a civil and

electrical engineer, and was formerly engineer for the British Insulated & Helsby Cables, Ltd., of England. Among the many large undertakings, which he carried out for the latter company was the electrification of the Government dockyard and naval base at Malta.

Sre. G. MARCONI, who is in the United States, was presented with the honorary degree of Doctor of Science by Columbia University on June 6th.

Roll of Honour.—Second-Lieutenant W. P. CALDER, K.R.R., was killed by a shell on June 14th whilst leading his platoon in attack. He was with Messrs. Siemens Bros. & Co., Ltd., for 19 years, and left the cable department of that company to join the Army. His captain speaks of him as a brave, energetic, and faithful officer who did excellent work.

The death of Major CYRIL R. M. YOUNG is reported, he having succumbed to wounds received in action on June 7th. The deceased officer was the eldest son of Dr. and Mrs. Moffatt Young, of West Hartlepool, and, prior to the war, was in partnership with Mr. Hodgkin, of Darlington, as a consulting electrical engineer.

The son of Mr. George Parkinson, of Waterhouses, County Durham, Sapper T. PARKINSON, R.E., has been wounded. Formerly he was an electrician at a local colliery.

Corporal D. MENDAY, R.F.A., telegraphist at Portsmouth Post Office, has been awarded the D.C.M. He volunteered to remain at a battery position to keep up telephone communication when the battery was ordered under cover.

Corporal E. JACKSON, West Riding Regiment, who has just been awarded the D.C.M., was an electrician at the works of Messrs. R. F. Winder, Leeds.

Lance-Corporal M. HOGAN, who was on the Colchester Corporation tramway staff, has died of wounds. He had gained the Military Medal.

Lieutenant C. STREET, R.F.C., killed, was trained as an electrical engineer at Broadheath, and gained a commission in the Cheshire Regiment.

Private CECIL GIBBONS, Lancashire Fusiliers, killed, was employed at the Peel-Conner Telephone Works, Ltd., Adelphi, Salford.

Mr. G. G. EWER, sales engineer to the Stepney Borough Council electricity supply department, who was a Captain in the 7th Batt. Essex Regiment (T.F.), and was promoted Major in 1915, has just been promoted to Lieutenant-Colonel of the 1/6th Essex Regiment, and has, in addition, been awarded the D.S.O. Lieut.-Col. Ewer saw service in Gallipoli and in Egypt in the early days of the war, and is now serving with the Egyptian Expeditionary Force.

The Stepney electricity undertaking has now over 60 employees serving with the Colours.

Private JOHN CHARNOCK, Loyal North Lancashire Regiment, killed in action on June 7th, aged 32, was employed by Messrs. Dick, Kerr & Co., Ltd., Preston.

Councillor JOHN BANNISTER, a member of the Electricity Committee of Burnley Town Council, has died from typhus in Egypt, aged 39 years. He held the rank of sergeant.

Lance-Corporal T. ANDERSON, aged 33, attached to the Intelligence Department, has been killed in action in France. He served his apprenticeship as an electrician with Messrs. Thompson, Blackburn.

Sapper W. E. B. GRATION, R.E., killed in action, was employed at the Bradford Corporation electricity works, Bolton Road.

Lance-Corporal A. WEATHERHEAD, West Yorks. Regiment, reported wounded and missing, was an electrician in the employ of Mr. Thos. Wray, electrician, Harrogate.

Private JAMES A. CALLAGHAN, Loyal North Lancashire Regiment, who has been killed in action, was employed by Messrs. Frankenburg, of Manchester.

Sergeant F. PRATT, Royal Scots, killed in action in France, served his time as an articled pupil with Messrs. Bruce Peebles & Co., with whom he was a designer when he enlisted.

Lieutenant L. S. MADORELL, Australian Infantry Brigade, awarded the Military Cross, was an electrical student at the works of the Manx Electric Railway Co., Douglas (Isle of Man), prior to going to Melbourne, Australia.

Bombardier A. R. TANSLEY, R.F.A., who was an electrician with the G.E. Ry. Co., has been awarded the Military Medal.

Mechanical Staff-Sergeant A. H. MARSHALL, A.S.C., drowned at sea, served his apprenticeship with Mr. A. House, electrical engineer, of York, and was with Messrs. Elphick, of Newcastle-on-Tyne.

Sergeant E. WALLIS, who has gained the Military Medal for conspicuous bravery, was engaged with Messrs. Fraser and Chalmers, of Erith.

Corporal L. A. GLOVER, Queen's West Surrey Regiment, killed in action at the age of 43 years, was for some years with Messrs. Baxter & Caunter, London.

The *Times* states that Second-Lieutenant S. H. L. DOUGLAS-CROMPTON, Royal Fusiliers, who was killed on June 7th, aged 21, was intending to become an electrical engineer, and was at a technical college when the war broke out. "He tied a blue handkerchief on to the end of his stick, and told his men to follow it. He . . . seemed to forget there was any danger. . . . While rallying his men he was shot by a sniper."

Obituary.—PROF. K. BIRKELAND.—Prof. K. Birkeland, of Christiania, died in Tokio on June 18th. His name is well

known as that of the joint inventor of the Birkeland-Eyde electrical process for the fixation of atmospheric nitrogen, which now employs approximately half a million n.r. of electrical plant. Prof. Birkeland was an eminent physicist, especially interested in terrestrial and solar magnetic and electrical phenomena.

REVIEWS.

Alternating Currents. By C. E. MAGNUSSEN. London: Hill Publishing Co. Price 17s. net.

So many text-books on electrical engineering have been issued recently by American writers that it becomes more than a little difficult to distinguish between them, and to assign to each its special suitability for different classes of engineering students.

It may be well, therefore, to begin the present notice by attempting to outline the special characteristics of the work to which it applies.

Like several others that have been noticed recently in our columns, the present work is the result of notes of lecture courses prepared for undergraduate students—in this case at the University of Washington. The discussion as a whole is confined to main principles, and little descriptive or constructional matter is included.

The first chapters deal mainly with the conditions existing in simple alternating circuits, and contain a very full introduction to the vector algebra of such circuits, worked out with numerous and clear diagrams.

Following this general introductory matter, which occupies the first 11 chapters, we have one chapter devoted to each of the following types of machines:—Transformers, induction motors, alternators, synchronous motors, rotary converters, single-phase commutator motors, and asynchronous generators. The principles of the behaviour of each of these machines are treated mainly by means of vector diagrams and vector algebra.

The next two chapters deal with the "dielectric circuit," and give a very interesting elementary introduction to the general theory of insulation. The remaining seven chapters deal with transmission lines, protective devices, and wave forms. In this last section, again, vector diagrams and vector algebra are employed, except in the chapter on protective appliances, which is mainly descriptive in character, and contains a number of illustrations of actual pieces of apparatus.

It will be gathered from what has been said that the book is essentially a student's text-book, rather than a book for general reference, also that it makes no attempt to deal with questions of design or construction, but deals (chiefly by means of vector analysis) with underlying principles. It is, further, only in the last section, dealing with transmission lines, that a fairly advanced treatment involving considerably higher mathematical knowledge is included.

We may next proceed to discuss in rather greater detail the treatment of the various parts of the subject. In the first section, which deals with the general alternating circuit, we are led through series and parallel circuits containing resistance, inductance, and capacity, and with the aid of a very clear series of diagrams, the methods of treating each case algebraically and symbolically are well explained. The author has adopted the simple device of distinguishing between the vectors of current and voltage by giving a different shape to the barb of the arrows used in the diagrams. The symbolic notation follows in the main that of Steinmetz, though some variations have been introduced without any apparent reason.

The treatment of the behaviour of the various types of machines is mainly vectorial, and accordingly such subjects as the wave form of alternator voltages, currents, and reactions are not dealt with in great detail, nor are irregularities due to the slots of induction motors dealt with. A special chapter towards the end of the book is, however, devoted to the subject of commercial wave forms and harmonics, and many typical examples are illustrated and discussed in detail.

To the more advanced reader, the second portion of the book, especially the chapters dealing with the "Dielectric Circuit," and with transmission lines, will prove the most interesting, and it is in these chapters that the author has departed from the beaten track followed by the ordinary student's text-book. The treatment of the problems of insulation and electric high-tension discharge as special cases in the general dielectric circuit is quite admirable. The vectorial treatment of transmission lines, although perhaps less original, is also excellent, and brings the subject within the range of the average advanced student. The very full chapter on wave forms has already been referred to.

In conclusion, we may congratulate the author on the production of an excellent text-book which should prove useful to many undergraduate students of electrical engineering. Perhaps its leading characteristic is its great clearness and its consistent application of vectorial methods as adapted to a very large variety of problems.

A Laboratory Course in Practical Electricity for Vocational Schools and Shop Classes. By M. J. ARCHBOLD. New York: The Macmillan Co. Price 5s. net.

The author of this manual is the instructor in vocational electricity at the Wendell Phillips High School, Chicago, and the general trend of trade school teaching in the States is fairly indicated by the type of experiment and the method of treatment given in this book. It is claimed that any textbook can be used in conjunction with this course of experiments, and the loose-leaf arrangement permits alteration of the order of work at the discretion of the teacher.

The course is divided into four terms, or semesters, of about 25 experiments each, and a course of practical shop work is suggested to correlate with this manual. The first section commences with simple experiments on magnets and magnetic fields, and leads up to voltaic cells, galvanometers, Ohm's law, and the commercial measurement of resistances. The method of treatment can be best explained by illustrating in a few typical cases. The loose sheets serve as the record of the experiments done, and, as the instructions are all printed in the past tense, it only remains for the student to make his own diagrams and fill in a few words here and there to complete the sheets.

For example, in the experiment on "Making a Compass Needle" we find an oblong space about 2 in. by 3 in., headed "Sketch of spring being rubbed with magnet. Resulting poles marked," and alongside, these sentences awaiting completion:—

"The watch-spring compass was brought near the North Pole of the bar magnet and it attracted the — end of the compass.

"The end last touched by the bar magnet was found to be a — pole, and attracted by the — pole of the bar magnet.

"It was found that like poles always — each other, and unlike poles always — each other."

The same insistence on a stereotyped method of recording results and deductions continues throughout the book. The later and more difficult experiments, however, bear less resemblance to missing-word competitions than the earlier ones.

The second semester's work deals further with resistance measurement, heating effects, and energy costs. Meter reading is taught with some pains, and some introductory work on electromagnetics is begun. The third section deals fully with motors and dynamos—motors first because dynamos are driven by motors in most schools; the fourth section begins with the elementary principles of alternating currents, and then proceeds to A.C. generators, motors, transformers, and meters.

In an appendix sketches are given of all experiments and connections, together with tables of sines, cosines, tangents, and B. and S. wires.

The strong points of the book are (1) its insistence on the systematic recording of experimental results, and (2) its habit of putting questions at the end of each experiment to discover whether the principles have been fully understood. Its weak points are (1) the stereotyping of experimental records, and (2) the spoon-feeding adopted in the missing-word method in the earlier chapters. In spite of these defects, it is certainly desirable that such books should be seen in this country. English trade-school teaching methods are still far from perfect, and while American methods cannot be adopted *en bloc*, they indicate important progress in a department of education which we cannot afford to ignore.

The pale khaki cover and the white linen backing do not appear to us to be suitable for the hard wear generally accorded to a laboratory book, but in other respects the arrangement and production of the book are pleasing and satisfactory.—P. H. S. K.

Electrical Laboratory Course for Junior Students. By MAGNUS MACLEAN, M.A., D.Sc. London: Blackie & Son. Price 2s. net.

This little book is intended to cover an elementary first year's course in electrical engineering. It has been prepared by the head and staff of the electrical department of the Royal Technical College, Glasgow, from MS. instruction sheets used in the laboratory, and comprises descriptions of 70 experiments with detailed instructions, theoretical notes, and diagrams of connections.

Some idea of the scope of the book can be obtained from the following typical experiments: Maps of magnetic fields, determination of "H," constant of a tangent galvanometer, measurements of resistance by meter bridge and P.O. box, measurement of high and low resistances, E.C.E. of copper, Joule's equivalent, photometry of glow and arc lamps, B.H. curves, cable faults, Kelvin balance, characteristics of dynamos. A page of "Instructions to Students" is given at the beginning of the book, and there is also an appendix of useful data.

All the instructions and hints bear the hall-mark of practical experience and common-sense, and the book is likely to serve a useful purpose in connection with similar practical electrical courses in other technical institutes and colleges.—P. H. S. K.

NEW COMPANIES REGISTERED.

Macfarlane Winch Co., Ltd. (147,812).—Private company. Registered June 25th. Capital, £12,000 in 100 shares of 1s. each and 12,000 shares of £1 each. To take over from G. T. Macfarlane patent 1,089 of 1917, in connection with ships' winches, on the terms of an agreement between the said G. T. Macfarlane, of the one part, and the Power Plant Co., Ltd. (for this company), of the other part, and to carry on the business of mechanical, electrical, hydraulic, marine, and general engineers, &c. The subscribers (each with one share) are: E. Trevor L. Williams, J.P., Clock House, Byfleet, Surrey; G. T. Macfarlane, Innanincka, Cannons Lane, Pinner, Middlesex, mariner. The first directors are: E. Trevor L. Williams, J.P., and G. T. Macfarlane. Solicitors: Messrs. Slaughter & May, 18, Austin Friars, E.C.

Hooton & Ellesmere Port District Electric Supply Co., Ltd. (147,800).—Private company. Registered June 25th. Capital, £3,000 in 1,500 "A" shares and 1,500 "B" shares of £1 each. Objects, as title. Agreement between the Rt. Hon. Lady Rossmore and Mary Straker of the first part, Johnson & Phillips, Ltd., of the second part, and S. S. Dawson (for the company) of the third part. The subscribers (each with one share) are: S. S. Dawson, 51, North John Street, Liverpool, chartered accountant; T. R. Cholmondeley, Pont-y-Ochlin, Gresford, North Wales, estate agent. The first directors are: S. S. Dawson, T. R. Cholmondeley, J. Macgregor, and C. Stewart. Registered office: 136, Albany Buildings, Old Hall Street, Liverpool.

Blackwall Engineer & Welding Works, Ltd. (147,833).—Private company. Registered June 28th. Capital, £3,000 in £1 shares. Electricians, mechanical, and electrical engineers, welders, makers of motor vehicles and parts thereof, &c. The subscribers (each with one share) are: H. Andrews, 61, Welbeck Road, East Ham, E., accountant; G. Steel, 5, Disraeli Road, Forest Gate, E., electrical engineer. The first directors to be appointed by the subscribers. Solicitor: W. Cook, 59, Gracechurch Street, E.C.

British Glass Wool Co., Ltd. (147,843).—Private company. Registered June 29th. Capital, £1,500 in £1 shares. Manufacturers of glass wool and glass fibre, importers and manufacturers of electrical appliances applicable thereto, and any other electrical and mechanical appliances, &c. The subscribers (each with one share) are: A. R. Holmes, 38, Highbury Hill, N., engineer; Alice M. Stevens, 41, Loraine Road, Holloway, N., clerk. The first directors are: A. R. Holmes (permanent) and Alice M. Stevens. Solicitor: D. W. Marpole, 1, Kenfrew Road, S.E.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Carrickmacross Lighting Co., Ltd. (4,276).—Particulars of £2,500 debentures created November 14th, 1916, and April 20th, 1917, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital, and certain premises, &c., in Chapel Lane, Carrickmacross. Trustees: W. Pierce, Carrickmacross, and F. A. Orr, Castleblaney.

Electrical Contracts & Maintenance Co., Ltd.—Memorandum of satisfaction in full on March 5th, 1914, of debentures dated May 11th, 1909, and August 4th, 1910, securing £300 and £100 respectively. Notice filed June 26th, 1917.

Metropolitan Electric Supply Co., Ltd.—Particulars of £250,000 debentures created May 15th, 1917, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: (1) Freehold land and generating station at Acton (subject to a prior charge); (2) so much of a piece of freehold land at Willesden on which generating station stands as is not comprised in the security for the 3½ per cent. second mortgage debenture stock; (3) the undertakings constituted under the Hanwell Electric Lighting Order, 1904, the Acton Electric Lighting Order, 1891 (subject to prior charge), and the Southall-Norwood Electric Lighting Order, 1905; (4) the undertaking relating to the Urban District of Greenford constituted under the Uxbridge & District Electricity Supply Extension Order, 1903; (5) 6,000 preferred paid shares in the Broomfield Electric Supply Co., Ltd.; and (6) the company's undertaking and general assets, subject to charges under trust deed of July 20th, 1894, and July 4th, 1899. Trustees: Trustees, Executors & Securities Insurance Corporation, Ltd. Commission, allowance or discount: 10 per cent.

Contraflo Condenser & Kinetic Air Pump Co., Ltd. (110,264).—Capital, £80,000 in £1 shares. Return dated May 18th, 1917. All shares taken up. 7s. per share called up on 27,000; £9,450 paid. Mortgages and charges: Nil.

Cutting Bros., Ltd. (81,178).—Capital, £25,000 in 1,500 ord. and 1,000 pref. shares of £10 each. Return dated December 29th, 1916 (filed February 28th, 1917). 500 ord. shares taken up; £1,000 paid on 100; £3,200 (£8 per share) credited as paid on 400.

Chislehurst Electric Supply Co., Ltd. (50,980).—Capital, £15,000 in £5 shares. Return dated April 16th, 1917. All shares taken up. £15,000 paid. Mortgages and charges: £9,000.

W. G. Cannon & Sons, Ltd. (87,796).—Capital, £3,000 in £1 shares. Return dated June 7th, 1917. All shares taken up. £9 paid; £2,991 considered as paid. Mortgages and charges: Nil.

CITY NOTES.

United Electric Tramways of Monte Video, Ltd.

SIR G. A. TORCHIE, M.P., said that the difficulties of the year had been rather worse than in 1915. Nearly three-quarters of the increase in operating expenses arose from the high price of coal. To-day it was about 150s., with no improvement in sight. Freights which used to be 12s. to 14s. per ton were now 100s. to 120s. The Eight Hours Law of Monte Video also meant both increase of wages and increase of staff. Heavy renewals would occur in the near future, especially in connection with re-paving. But these were abnormal times, and they ought not

to defer dividends, especially preference dividends, unless it became absolutely necessary. The chairman referred at some length to the fact that the municipality was proceeding with its vast paving programme, notwithstanding the times. Their interests were being, and would continue to be, very seriously affected thereby. The whole cost of paving the streets was defrayed by the owners of property on either side in equal parts. Where tramway lines existed the company had to pay for the equivalent of the space occupied by the lines, and 50 centimetres on either side of the rails. Anything that tended to strangle tramway enterprise was inimical to the public convenience. Proceedings had been commenced in Monte Video with a view to obtaining a definite decision as to the company's legal position. The next six months were the lean months, when there were no exceptionally heavy traffics to help toward meeting the fixed charges, now abnormally high. They must be patient and await events.

Aluminium Corporation, Ltd.

MR. KENNETH CLARK, presiding at the annual meeting on June 27th, said that they had hoped to clear off another year's preference dividend at that meeting, but the taxation upon industries of their description was of a heavy character, and the settlement of the various items in the accounts was a matter of very great difficulty. It was, therefore, impossible to estimate at present what amount would be available for distribution, so they were carrying the balance forward. He hoped that the authorities would bear in mind that theirs was one of the key industries of the country, and that their opponents in other countries had been reaping a large benefit from the enormous prices that they had obtained for their metal, and their profits had been practically untouched by special war taxes, so that they had been able to build up large reserves which would put them in a strong position in respect of international competition. The difficulties in regard to supplies of raw materials, labour, freight, &c., had increased during the year. Their increase of output had been a matter of much concern, and they had carried out during the year, and under difficulties, a large amount of work with that end in view. The negotiations for the purchase of the additional water rights had been prosecuted vigorously, and a great many difficult purchases carried through. The plant for the erection of the dams had been purchased, and the means of transit from the North-Western Rly. Co. to the site of the dams, 1,200 ft. above sea level, provided. The bridge across the Conway River had been constructed, and they were now able to take the L. & N.-W.R. Co.'s trucks right into the works yard. The new turbo-generator had been delivered, and would undergo its trial run in their works within the next few days. This meant an increase of 20 per cent. to the capacity of their electrical plant, and should put them in a position during the coming winter, for the first time in their history, to make full use of their pipe line; but they would not be able to make full use of the entire electrical capacity until they had completed their erection of the new dams, so as to store the necessary water to provide power during the summer months. During the year they erected a heavy rolling mill plant, with three trains of rolls, and these had been in satisfactory use for some time past. This addition should be of great assistance to the company, for it would enable it to market its output in the form of sheets. Last year's output was the largest in the company's existence; in fact, it showed an increase of more than 30 per cent. in their production, mainly due to the Duly tunnel, which had far more than justified its formation. They had under consideration a funding scheme, which they hoped to submit at a later date, with a view to dealing with the arrears on preference dividend. The war had shown new uses for aluminium, and, in his opinion, the production of light alloys would be an important feature of the aluminium industry in the years to come. He looked, therefore, for a largely increased demand after the war. They now had a sound business, which had proved itself to be a national asset, but it was absolutely necessary that they should continue their policy of extension, and this meant a continuance of capital expenditure, for which large sums of money would be necessary. He trusted the time was not far distant when they could begin to put aside sums of money as reserves for the many contingencies that had to be met by all trade concerns. In replying to discussion, the chairman said that the company was in a very sound position. It was doing extraordinarily well; costs had come down very much, and if they were successful in getting the water which they had in view they would not only be able further to increase their production, but probably to double it.

British Columbia Electric Railway Co., Ltd.

The directors announce that, owing to the serious increase in the cost of living, the tramway employees asked for an increase in wages, which it was absolutely impossible for the company to pay, in face of jitney motor-car competition, and having regard to the present fares charged. The men stopped work on June 19th. Public pressure, arising from the cessation of the services, compelled the authorities to take action and approach the company, with the result that the company agreed to reinstate the services, making the best possible terms with the employees on the understanding embodied in resolutions

of the City Council that an impartial investigator be appointed by the Provincial Government to examine and report on the transportation problem in the city and surrounding district, with particular reference to the jitney motor-car competition. The city and the company have agreed to abide by the Commissioner's recommendations. The company has agreed to resume the railway services until the Commissioner's recommendations are received. These services were resumed on June 21st, and the company is paying the increases asked for by the men.

Consolidated Electrical Co., Ltd.—Mr. H. ALLEN presided at the annual meeting, and said that there was a trifling decrease in the net income, due entirely to the reduced dividend received on their telephone shares, which he believed would be only temporary. The net result of their operations was that they paid the same dividend as for the previous year, carrying forward £3,006, against £3,159. They were practically free from liabilities; investments had suffered no material depreciation during the year.

Telegraph Construction & Maintenance Co., Ltd.—Interim dividend of 5 per cent. (12s. per share), free of tax.

Browett, Lindley & Co., Ltd.—For 1916 the net profit, after providing for interest charges and writing £6,134 off for depreciation, was £9,450, out of which the full year's dividend of 6 per cent. has been paid on the preference shares, together with an extra distribution of 3 per cent. on account of arrears, and a dividend of 4 per cent. on the ordinary shares, leaving £3,540 undivided, subject to excess profits duty.—*Financial Times*.

West Coast of America Telegraph Co., Ltd.—After providing for interest charges, transferring £14,000 to general reserve, and providing £1,000 for investment fluctuations, £9,286 is carried forward.

STOCKS AND SHARES.

TUESDAY EVENING.

THE Stock Exchange "enjoyed" a long week-end holiday, which few wanted, the pretext being an ancient rule providing that the House shall be closed on all Bank Holidays. This served to cut into what little business there is at this season of the year, and, in consequence, markets have been very quiet. Questions are in the air as to what may be the prospect for another War Loan, but well-informed quarters look for nothing in the way of a popular loan for some time to come.

At the commencement of the half-year just ended, the 5 per cent. War Loan was imminent, and its official terms were published early in January. These terms proved sufficiently tempting to save the fall in other investment stocks that had been freely predicted. Markets resisted the triumphant newcomer with a strength surprising to those who remembered the financial disturbance created by the 4½ per cent. War Loan of June, 1915.

We may with advantage set out the net rises and falls in markets connected with electrical companies' shares, for the six months have been big with war happenings, naval, military, and political, with their effect upon the stocks and shares of the world. How lightly they have touched so purely an investment market as that for electricity supply issues this comparative table shows:—

Share.	Jan. 2.	Now.	Rise or	Share.	Jan. 2.	Now.	Rise or
			fall.				fall.
Brompton ..	6½	6½	—½	London Electric	1½	1	—½
Charing Cross ..	3½	3½	+½	Metropolitan ..	2½	2½	+½
Chelsea ..	3	2½	—½	St. James's ..	6	6½	+½
City of London ..	11½	12	+½	South London ..	2½	2½	—
County of London	10½	10½	+½	South Met. Pref.	21.6	21½	—6d.
Kensington ..	5½	5½	—½	Westminster ..	5½	5½	+½

Of these 12 companies, the March reports for the year 1916 showed an overhead increase in gross revenue amounting to 9 per cent. above that of 1915, but the expenses were 11 per cent. higher, the latter figure working out to no less than 67 per cent. of revenue, as compared with 51 per cent. for 1913, the year before war started. Four of the companies reduced their dividends, the Brompton, Chelsea, Kensington, and the London. The last-named passed its dividend altogether, as compared with a payment of 3 per cent. in 1915, this being caused by an accident to the generating station. No increases were made, but the South Metropolitan repeated the distribution of 4 per cent. which it made for 1915, the first since 2½ per cent. was paid for 1908. The introduction last year of "summer time" played havoc with prices. At the Brompton and Kensington meeting, three months ago, the chairman, referred to summer time as being an undoubted benefit to the community at large, but an "unmitigated evil to the purveyor of artificial illumination." It was a prominent factor in lowering the long-established dividend

rate, in the case of his own company, from 10 per cent. to 9 per cent.

Railway stocks, as regards the Tubes, have given way, the present price of $s2\frac{1}{2}$ for Underground Electric Incomes being 10 points below that with which the year began. This was the natural sequence to the dividend being lowered (for the last half-year) to 2 per cent., as against the 3 per cent. to which the bonds are entitled. Districts have shed $\frac{1}{2}$, and Metropolitan at $23\frac{1}{4}$ are $1\frac{1}{4}$ lower on the six months.

Telegraphs and telephones are mostly higher, the upward movement being continued with steadiness throughout the period. Marconis at $35\frac{1}{16}$ are $8s. 9d.$ to the good on balance, though Americans are almost unchanged at 16s.; Canadians at 11s. are $1s. 6d.$ up. British Columbia Electrics have fallen heavily, on fears of municipal competition. Mexicans are higher; Brazil Tractions 4 points down, due to the board's decision to pay no more dividends this year on the common shares.

The Manufacturing group shows noticeable firmness in most instances. To tabulate interesting examples:—

Share.	Jan. 2.	Now.	Rise or fall.	Share.	Jan. 2.	Now.	Rise or fall.
Brit. Aluminium	28/6	28/9	+3d.	Edison p.p.	..	13/1	+2
Brit. Insulated	11/1	12/1	+1/1	Electric Con.	..	13/1	+1
B. Westinghouse	..	22	..	Gen. Electric	..	13/1	+1
Callender's	13	13/1	..	Henley	..	16	15/1
Castner Kellner	3/1	3/1	..	India-Rubber	..	12/1	12/1

Appreciable rises have taken place in armament, coal, iron, and steel shares. The rubber share market has been extremely active, and although the top prices of March/April are not maintained, the half year has left most rubber quotations higher than they stood six months ago.

Death by Induction.—The *Journal Télégraphique* quotes from *Annales des P.T.T.* particulars of a remarkable fatality due to a shock received by induction. In the valley of the Romanche, France, there are numerous generating stations and power transmission lines working at pressures from 25,000 to 55,000 volts, three-phase: a State telephone line, carrying interurban circuits and several telephone lines belonging to the power companies, parallels the power lines over a considerable distance. On April 28th, 1916, a lineman connected with one of the companies was speaking with a portable telephone set on one of the private lines when he received a fatal electric shock. An inquiry followed, which revealed the following circumstances:—At the time of the accident no contact could have taken place between the telephone circuit and the high-pressure lines. The cut-outs on the State lines carried on the same pole as the private circuit operated, and shocks were felt by State employés in the telephone service. At the moment when the accident took place, a sudden interruption occurred on a power line working at 15,000 volts, which paralleled the State line over a length of 20 km. (12½ miles). The abnormal pressure rise which caused the accident was not due to any contact between the lines; it was produced by induction between the power line and the telephone line. At the moment when the interruption of current took place, one of the three-phase cables remained for a brief interval at a high pressure, after the other cables had returned to zero voltage. Under the electrostatic influence of this cable the telephone line was raised to a pressure which occasioned the fatality.

Electrical Wages Award.—The Chief Industrial Commissioner's Department of the Board of Trade, in connection with the application of the electrical wiremen of Bradford and Shipley for an advance in wages from 1½d. to 1s. per hour, has raised the standard to 1½d. per hour, to cover and include all previous advances. Overtime is to be paid for at time and a-quarter for the first two hours, time and half afterwards to midnight, and double time subsequently until starting time next morning, double time also being awarded for Sundays and Christmas Day, and time and a-half for Bank Holidays. The working hours are reduced from 5½ to 4½ per week, and there are concessions in relation to night work, "dirty money," travelling and country expenses, &c. Engagements may be determined on either side by one hour's notice. Disputes are to be settled by a Council of employers and employés.

ELECTRO-CULTURE.

SOME NOTES ON H.T. DISCHARGE APPARATUS.

THOUGH only just beginning to attract public attention, electro-culture is by no means a new idea. The earliest attempts on record are to the credit of a Scotchman named Mowbray, who tried some experiments in the year 1750, though the first real advance was due to Lemstrom, who tried some experiments in Finland in 1885, and a few years later in England, France, and Germany.

The difficulties of such a research are very great, owing to the absence of exact data in all agricultural and horticultural work. The fertilising value of every manure differs from every other, and even different samples of the same kind do not give equal results, but will behave quite differently in different soils. Clay, loam, and sand all require different dressings, and the value of a manure on the one is no guide to its value on another. The very rain differs in its action on plant life under different climatic conditions and places. Plants are greatly influenced by the air. Some need wind—to others it is fatal. The contour of the land, whether at the top or bottom of a slope, the shelter afforded by trees and

the open market. The price which a public, ignorant of the experiments, and anxious only to get the best value, will give is a good guide and even an accurate measure of their relative worths. It needs, however, large plots of ground and considerable expenditure to conduct experiments on this scale, and even then great skill and judgment are wanted in choosing the plots and in preparing them for planting in such a way that the results may be truly comparable. Those who are used to making practical comparative tests will from these considerations realise the almost insuperable difficulties under which Lemstrom worked.

He himself alludes to the investigation "as by no means inviting." Nevertheless, despite all the inexactitude of the agricultural side, the utter lack of knowledge on the botanical, and the absence of suitable apparatus on the electrical, he tackled the subject with a very large measure of success, and laid the foundation of a new industry which we slow and conservative people are just beginning to develop 30 years later under the beneficent stimulus of German malevolence.

These early experiments were made with influence machines of various types, one terminal being connected to earth and the other to a network of wires over the plants, which at the first were grown in pots, but later in the open ground. Constant trouble

occurred with the generators, which would reverse polarity frequently and sometimes fail to excite, while at other times the damp atmosphere would form practically a short circuit path for the extremely small quantity of electricity which these machines can deliver. Thus his experiments, while leaving no doubt as to the general value of the electrical discharge in plant growth, and enabling him to make several important generalisations, are confused and unconvincing in detail.

The advent of X-rays and wireless telegraphy produced an imperative demand for a practical high potential generator, and the supply which quickly followed made it possible to try Lemstrom's experiments on a larger scale, and with more intense discharges. Our knowledge of atmospheric electricity and of the discharge of electricity through gases, has increased enormously since 1885, so that we are now able to take measurements of the quantities of electricity involved, and even to form some very rough idea of how it is carried from the overhead wires to the plant.

For the last 12 years experiments have been carried out in England on an extensive scale in several different places on different soils and under different climatic conditions, the leaders in the work being Sir Oliver Lodge and Prof. J. H. Priestley, the latter with the help of the Board of Agriculture. The results obtained have been the subject of reports in the *Journal of the Board of Agriculture* (April, 1910; October, 1913; January, 1915; October, 1916; April, 1917); from these reports all the figures that are given here have been taken, and they may thus be regarded as cautious and well considered data not likely to err on the side of over-estimation.

The Apparatus Used.—Ever since Lemstrom's experiments the method of distributing the charge to the crops has been much the same, a network of wire, or strands of barbed wire or plain wires are stretched over the field at a convenient height by means of H.T. insulators, and kept charged to a potential of about 80,000 to 100,000 volts.

A net is too inconvenient and costly for large areas, while barbed wire involves the use of very heavy poles and large insulators, account of the great strain needed to keep it reasonably taut—thus the choice usually falls on a plain wire.

The density of an electric charge at any point on a body is proportional to the curvature at that point; that is, the potential relatively to earth will be greater the greater the curvature, and thus it comes about that the wires used should have as small a diameter as practicable, so as to keep as low as possible the potential necessary to produce a discharge. With wires of from 24 to 30 s.w.g. 90,000 volts maximum appears a good medium. It will be noticed that this is just about the pressure at which it is possible to transmit power without corona troubles being serious, i.e., at this potential it is possible to send currents without loss along large wires, but discharge takes place from fine ones. All leads to the network can, therefore, be of bare wire of 10 or 12 s.w.g.

The fine wires if of silicon bronze or galvanised steel may be used without fear with a span of 150 ft. and a sag of not more than 8-12 in. They should be kept as low down as possible, as this increases the intensity of the discharge, but in order to avoid localising it on the highest plants, the distance between wire and ground should not be less than twice the height of the full grown plant. Generally it has to be greater still to allow for working underneath: 7 to 9 ft. seems to be a good range, as a man with a hoe can work underneath without disturbing the wires.

DISMANTLED HUT SHOWING ELECTRO-CULTURE SET EXHIBITED BY MESSRS. W. H. COX & CO., AT THE RECENT MUNICIPAL ELECTRICAL CONFERENCE.

hedges from sun, wind, and rain—all these things, and many others, help to determine the rate of growth. For no single one of all these things can any exact unit be determined. Generalisations and roughly true empirical laws can be laid down, but there has never been written any equation connecting together all or some of these variables, and the result of their mutual interaction can only be estimated, the degree of accuracy depending on the soundness of some person's judgment and the breadth of his experience.

The usual experimental procedure is to plant several plots with whatever is to be the subject of experiment, taking care to keep the conditions as nearly as possible identical in all. One plot is treated in the special way under investigation, and the rest in the normal manner: then any difference between the growth under special treatment and the average growth of the others may be taken to be due to that treatment, and, where measurements can be made, a ratio obtained.

Quantitative results are, however, always difficult. One may be able to say definitely, that one flower is better than another, but by how much? One potato or tomato may be heavier than another, but is the quality the same in both, and how can that quality be measured? Where the thing is done on a large enough scale, a solution of this dilemma is found by selling the goods in

but each individual case must be decided on its merits. The space between wire and wire should be about two-thirds of their distance from the ground, in order to obtain a fairly high intensity of discharge.

One of the best methods of suspension is to place stout poles set in concrete at the corners of the field: old telegraph poles cut in half do well, and can generally be bought at a moderate rate from the local telegraph engineers' depot. Extra-high-tension insulators

VIEW SHOWING COIL, SPARK GAP AND INTERRUPTER.

are fixed to these, and from them span wires of galvanised iron are taken along the length of the field. Should this length be greater than about 150-200 ft., intermediate poles are used: these may be lighter than the main ones.

The fine discharge wires are strung across from span wire to span wire. Light brass hooks form as good a connection as anything, and allow the discharge wires to be shifted or taken down. The H.T. current is fed to the thick span wires, which conduct it with but little loss to the fine wires, from whence it discharges on to the crops.

The H.T. current may be produced in several different ways, each of which has its own peculiarities, its advantages, and disadvantages. The usual generators are:—

1. *Static Machines.*—The current from these is ideal for the purpose, being at a constant potential, but even with the largest machines there is difficulty in getting sufficient quantity. There is apt to be difficulty in damp weather, owing to the machines failing to excite or losing excitation if the resistance of the external circuit drops. Many types have a nasty habit of reversing polarity for no obvious reason. The machines have to be kept absolutely free from damp, and are expensive.

2. *Step-up Transformers.*—As a source of high potential, these are the simplest, cheapest, and most efficient, but the current from them needs either rectification or the suppression of one half wave, so as to impart a unidirectional charge to the wires.

The former is attained by the use of a revolving shaft driven by a synchronous motor, and carrying conducting arms, which alternately make and reverse connection between the H.T. ends of the transformer and the main contacts.

This is the best machine by far for large areas—say, of 50 acres and upwards—is simple and reliable, but the cost, which may be anything between £200 and £400, makes the outlay rather high for small areas.

The suppression of one half wave is done by the use of a "valve tube." This instrument, the best-known type of which is the "Lodge," consists of a glass globe evacuated to one or two millimetres of mercury and containing two electrodes, one of large area and with a good space round about it, the other of small area, as closely confined as possible, and often surrounded by an electrostatic shield. The former conditions are favourable to the formation of the "negative dark space" which always accompanies a discharge *in vacuo*; the latter unfavourable. Thus there is considerably less opposition to the current passing one way than the other. A different and more efficient type of valve is the "Kenotron," in which the negative electrode consists of a red-hot spiral in a vacuum which, giving off ions, will allow current to flow from it but provides no path for a discharge in the opposite direction.

This method of charging up the network is not so ideal as it appears on paper, for several of the ordinary valve tubes are required in series in order to deal with 100,000 volts. They

gradually increase their vacuum owing to the absorption of gas by the glass walls, which causes a gradual increase of resistance in the right direction for the current without much compensating gain in the opposite; means are provided for rectifying this, but they are not very satisfactory, and after some time the valves become erratic in behaviour.

A "Kenotron" valve can be made to suppress 100,000 volts, but requires a battery or small transformer to heat the cathode, which must, of course, be charged to the same potential as the cathode itself, and thus has to be insulated for the full potential both from earth and the mains. Moreover, it is an expensive article, costing £50 or more to install.

Both types of valves are very fragile, being of thin glass and highly exhausted, they are also liable to "perforation"—i.e., puncturing of the wall by a high-tension spark from any conductor that may by accident be brought too close.

3. Some form of high-frequency apparatus has often been used, but the current from these cannot readily be rectified, and the effects produced are not so good, probably for this reason. Also, it is impossible to carry such currents along any conductor possessing appreciable self-induction, and thus it is very hard to charge a network evenly by this means. The generator always involves a spark gap, which burns and wears, and so needs fairly frequent attention.

4. *Induction Coil and Interrupter.*—This is probably the most efficient and satisfactory method of dealing with any plot not large enough to warrant the use of a H.T. transformer and revolving rectifier. The outstanding peculiarity of these instruments is the extremely asymmetrical wave they produce.

In principle, an induction coil consists of an open-core transformer of large ratio, the primary of which is fed with an interrupted direct current. Owing to the self-induction of the primary, which is kept as large as possible, the current grows but slowly, when the interrupter closes the circuit, and may take as much as 1-50th second or more to reach its full value. The induced potential in the secondary is, of course, proportional to this rate of growth, and will, in consequence, be comparatively small.

The interrupter is designed to break the circuit as quickly as possible, and to quench the resulting arc with the utmost rapidity and the least possible loss of energy in heat. The consequence is that the rate of decrease of the current is very much greater than was the rate of growth, and the potential across the secondary will be correspondingly greater. With a closed iron circuit the magnetisation of the iron will not fall to zero with the current, but lags greatly behind it, hence the need for the open core.

The general form of interrupter involves a mechanical break between a contact and mercury under some dielectric which will prevent oxidation. Either the mercury or the contact, or both, may be in motion.

The container is kept full of a liquid or gaseous hydrocarbon with good arc-quenching properties, and this, together with the rapidity of motion and the good cooling from the surrounding masses of metal, interrupts the circuit with great rapidity.

WEATHERPROOF HUT, SHOWING OUTGOING H.T. CONNECTION.

The current thus produced may have a peak value of 50,000 volts in one direction and only a few thousand in the other, and if such is supplied to a network of fine wires, a strong discharge will take place at each occurrence of the high-value peak, while on the other half of the wave the potential never becomes high enough to produce any effect.

The large ratio between make-and-break potentials necessitates good design both of coil and interrupter; the older apparatus of this type gives a far greater inverse potential than that mentioned, and so requires a valve tube to prevent the wires being raised to too high a negative potential.

Wireless and X-ray work have produced so great a demand for coils and interrupters that these have now become thoroughly

reliable machines, well made, and capable of standing up to their work without much attention, and seldom breaking down. The ordinary commercial types are, however, designed for much too high a secondary voltage for electro-culture work, and were not intended for such long continuous running. The heat conduction from the secondary is very bad, owing to the great insulation needed, and thus the C²R losses may cause dangerous heating, while the large number of turns set an upper limit to the discharge current, which entails the use of a much larger coil than should be necessary. A specially-designed coil is therefore required, giving great quantity at a less potential than usual, and with a very low-resistance secondary: it should also be designed with a view to being absolutely waterproof, as paraffin wax is slightly hygroscopic, as, indeed, are all that class of insulating compounds.

It will be seen that the current from this kind of set is in the form of intermittent impulses, so that the charge on the wire produced by one impulse can discharge back through the coil during the next interval. This can be avoided by putting a valve tube in circuit to check the back flow, but they are delicate, unstable pieces of apparatus, which give a good deal of trouble in use, and it is probably better to do without them and to use a coil capable of giving a sufficient discharge such that enough electricity may be given off at each impulse to bring up the mean current density in the air to the required standard without resort to such contrivances.

In all these instruments, some method of measuring the potential is needed, and the simplest seems to be a measurement of the sparking length. Below is a table connecting spark length with voltage, maximum values, which determine the sparking length, being given. In each case one pole is assumed to be earthed; this makes some difference in the high figures.

Max. volts. K.V.	Spark gap length in inches.		
	Points.	2½ balls.	5" balls.
10	35	—	—
20	65	—	—
30	100	—	—
40	15	5	5
50	20	65	65
60	27	8	8
70	35	10	95
80	—	12	11
90	—	15	125
100	—	18	14
110	—	23	16

It is very necessary to provide a thoroughly waterproof place for the apparatus, and provision should be made for warming, so as to drive off any condensation. The apparatus can be made to deal with either direct or alternating current, and any supply voltage between 25 and 250 volts.

Effects on Crops.—Some data and illustrations have already been published in the ELECTRICAL REVIEW for May 11th, 1917, where one of Prof. Priestley's reports is reprinted in full with two interesting illustrations, showing the improvement effected on wheat and second-year clover, and it is not necessary to add much here.

Young strawberry plants have increased in yield by 80 per cent., older ones by 36 per cent. and 25 per cent.

Potatoes are good subjects, and invariably show increases, usually between 20 per cent. and 50 per cent., the increase being in the size of the tubers, and not the number, from which it would seem that there was here a means of bringing new potatoes on to the market earlier. Carrots, beet, tomatoes and mangolds all show increases of from 20 per cent. to 50 per cent.

Wheat has been the subject of the most extensive and prolonged experiment, and the average increases shown up to 1914 were from 20 per cent. to 40 per cent. A crop grown in 1915 under a very much more intense discharge, showed an increase of about 50 per cent. in grain and nearly 90 per cent. in straw, besides being ready for harvesting earlier. The grain was also of a superior quality.

The effects of the discharge on germination appear to have been neglected of late, but there is abundant evidence to show that the young plants show earlier when the seed plots are treated: but in this country at least, caution must be used in forcing crops out of the ground in early spring on account of frost.

In greenhouse work, where there is no danger from frost, and all the elements are under control, there seems to be a wide field, and the application is not at all difficult, one wire, or at most two, being run parallel to the length of the house, attached to an 18-in. length of ebonite rod as insulator at one end, and passing through an E.H.T. porcelain leading-out tube at the other, the coil and interrupter being fixed outside the house. Special arrangements can be made to run several houses near each other from the same apparatus.

General Remarks.—The discharge appears to act, roughly speaking, as artificial sunshine, and as it is quite as possible to over-stimulate plants as human beings, judgment is necessary in determining how long to keep the discharge going per day. In damp, cloudy weather four to five hours per day seems about the time usually given in the most successful cases, and this should be diminished in proportion as the day is sunny, while in hot scorching sunshine and in times of drought the discharge should never be put on. Morning and evening are the best times for treatment, especially the former.

The crops under treatment draw more from the soil, both moisture and food, and therefore plenty of water and manure must be given. On soil that is too poor, or lacks moisture, no benefit will, and harm may, result.

In windy weather the electrified air is blown about, benefiting

neighbouring crops but diminishing the quantity received by those under treatment, and this should be allowed for in such weather, which is often the time when the treatment is most needed.

There seems to be a possible exception to the general rule in the behaviour of leguminous plants—a family characterised by the presence in their roots of small nodules containing colonies of bacteria, whose function appears to be the extraction of nitrogen from the plant, giving it to the soil. Such plants thus enrich the ground instead of impoverishing it, an outstanding exception to the general rule, which may have great significance in considering their behaviour under the discharge. Clover, however, which is one of this family, though it did badly when electrified one year, gave a superabundant crop the second year when it was not electrified, so that the treatment seems to have had an important after effect.

Another most useful effect is that blight and insects generally are destroyed by the discharge, which will quickly clean such things as beans and carnations when attacked.

There seems but little doubt that in the high-tension discharge we have a means of counteracting the lack of sunshine, which is the one drawback from the agricultural point of view to our very fertile land, and if properly exploited by men of energy, patriotism, and foresight it may yet solve the problem of making farming an easier and more lucrative profession.

The illustrations in the above article are of the electro-culture set made by Messrs. Harry W. Cox & Co., Ltd., which was shown to visitors at the recent annual meeting of the Municipal Electrical Association, in London.

This set is suitable for areas of from 10 to 15 acres, and consists of an induction coil, interrupter, switchboard, and resistance for controlling the discharge, and a time-switch for automatically switching on and off the discharge at the required times: this equipment is enclosed in a weather-proof hut, which can be electrically warmed to ensure dryness. A length of 25 yards of 7/20 twin cable is supplied, together with a plug fitting, for connecting the hut to the source of supply, also the necessary insulators for same and an earthing plate for connecting the negative pole to earth. This constitutes the apparatus required for generating and controlling the H.T. supply to the discharge network, which consists of thin copper discharge wires supported from galvanised steel span wires, which are carried on suitable insulators attached to poles. Messrs. Cox supply and erect the complete equipment, and provide the necessary supervision to ensure its successful working.

IMPORTS OF HOLLAND.

THE following figures, showing the imports of electrical and similar goods, for consumption, into Holland during the year 1915, are taken from the recently-issued official trade statistics; the figures for 1914 are added for purposes of comparison, and notes of any increases or decreases are given:—

Artificially Loading Hydro-Electric Generators on Test.

In the *General Electric Review* for April, Mr. R. Treat describes a convenient method of loading a turbine-driven generator for testing purposes without the use of water resistances, which has been used frequently by Messrs. R. A. Ross & Co., consulting engineers, of Montreal, since 1907. It consists in connecting another generator to the machine under test, with one phase reversed, so that it runs in the opposite direction of rotation as a synchronous motor. When both machines are up to speed, and are excited to full voltage, the gates of the wheel which is motoring are gradually opened until the required load is obtained, the wheel acting as a water brake. The generator and motor fields may then be varied to produce any power factor and voltage that may be desired.

It is found best to make the connections and close the main switches, and excite both machines, before admitting water to the generator wheel. When both machines are turning over, the reversed rotation of the motor should be verified. The voltage and speed of the generator are then raised to normal, and water is admitted slowly to the motor water-wheel to produce the desired load. The readings of the generator instruments indicate its output; those of the motor need not be taken into consideration. The governor mechanism should be disconnected from the motor, but an attendant must stand by to shut off the water in the event of the circuit-breaker opening. Only a small gate opening on the motor water-wheel is needed to produce full load on the generator.

FUEL ECONOMY AND CONTROL.

ONE of the most pressing questions of our time is the economical utilisation of our national fuel resources, which, though it has been a matter for discussion and speculation for a good many years, has only attracted public attention under the stimulus of war conditions. It is, however, now generally recognised that the industrial and commercial prosperity of this country primarily depends on its fuel resources, and the method of disposal of the latter is attracting widespread attention in scientific and industrial circles.

The paper recently read by Mr. J. A. Robertson before the Municipal Electrical Association dealt with one phase of this question, *i.e.*, the possible saving in fuel by its conversion to, and use in the form of, electrical energy; but this is only one of the many aspects of the problem of fuel economy, the treatment of which depends so largely on the point of view of the individual.

It appears to us, however, that there is only one broad view of the whole matter, on which our future policy must depend—that we should aim at the *conservation of fuel values* in the national interest, rather than in the interest of the individual. The latter is unlikely voluntarily to adopt any scheme with the above object in view which involves sacrifice on his part, and it seems fairly evident that no satisfactory solution of the problem of utilising our fuel resources to the best advantage will be arrived at without some measure of public control.

We may, for instance, consider Mr. Robertson's proposals in conjunction with the coal transport reorganisation scheme put forward by the Coal Controller, and referred to elsewhere in this issue. Both proposals are practically bound up with the transport question, for while Mr. Robertson would save the use, and therefore transport, of 30 million tons of coal for domestic and factory use, by "doing it electrically," in the future, the coal transport reorganisation scheme aims at the saving of some 700 million ton-miles during the next year in coal transport by re-arranging the producers and consumers of 40 million tons of fuel. Seeing that both schemes are broadly conceived, it is probable that a *pro rata* saving in transport, *i.e.*, over 500 million ton-miles annually, may result when Mr. Robertson's proposals materialise.

In passing, we may refer to the recommendations of the Controller of Coal Mines, published in our last issue, in which factory and domestic users are urged to supersede raw fuel by electricity, and assistance is promised in attaining the object in view, particularly by the interconnection of supply undertakings, where the saving of coal would warrant the necessary expenditure on plant.

It seems necessary to distinguish clearly between what can be accomplished now and what may be accomplished in the future; what we do now may or may not materially influence our course of conduct later on, when, as we may reasonably assume will be the case, the fuel utilisation problem of the country is identified with a definite national policy. Mr. Robertson, though claiming an open mind on the subject of coal carbonisation and by-product re-

covery in connection with electricity production, decides on present knowledge that the moment is inopportune for realising such schemes, mainly because it might result in a fractional increase in the cost of electricity; yet we note that he would have coal mining methods reorganised under Government control, so that the national wealth will not be wasted underground in the interests of mine shareholders and profit-making middlemen.

Even if the carbonisation of coal used in electricity works increased the amount of fuel required in the proportion of, roughly, 3: 2, as shown by Mr. Robertson, this would inappreciably increase our total home consumption of fuel, while it would, on the other hand, release valuable products which have in the past been largely imported from abroad. The modern power station combines two extremes—the turbine room, where scientific control has been reduced to a fine art, and the boiler-house, where such control is to a large extent abortive owing to the type of fuel employed, a difficulty which could be got over by gas-firing.

It is unthinkable that by-product processes will stand still, and even more unthinkable that we shall part with our diminishing store of raw fuel in the future, as in the past, while at the same time purchasing from abroad the manufactured products derived from it. We have in the past been prodigal in the expenditure of our fuel wealth; the nearness of our coal areas to the seaboard apparently supplied the incentive for our coal export business, on which, no doubt, both colliery and shipping interests have done exceedingly well, and unfortunately there are many people who regard fuel economy at home merely as a means of increasing our exports of raw fuel—of hurrying up the process of parting with additional tons of “our national capital,” as Mr. Robertson puts it.

The German Wire Lamp Trade.

As was recently mentioned in this journal, the principal glow-lamp makers in Germany have reached an understanding and decided to raise prices in general. It is probable that until this decision was taken the glow-lamp branch had occupied an exceptional position, as quotations had not previously been advanced in the German home market, it is said, since the outbreak of the war. This circumstance is all the more surprising in view of the great increase which has occurred in the cost of raw materials as compared with the prices ruling for these in the pre-war period. If an agreement has now been concluded, it is considered in Germany that the increase in prices possesses an importance which surpasses the limits of a simple price arrangement, as it gives expression to a readiness to come to a definite understanding. The most essential point of the new departure is the accession to the price arrangement of the Julius Pintsch Co., against which the competition of the A.E.G. group had previously been mainly directed, this group comprising, in addition to the A.E.G., the Siemens-Schuckert Works, the Bergmann Co., and the Auer Co. (German Incandescent Gas Light Co.). It is contended that advantage from the new arrangement will also be derived by the third group in the glow-lamp branch, which is formed of the factories of moderate and small size, and which produces lamps according to the drawn-wire process, the rights for which are claimed by the A.E.G. on the basis of patent rights obtained from the United States. An action on this matter is now pending before the Imperial Court. If a decision should be given in favour of the A.E.G., the firms concerned would be confronted with claims which would, it is thought, at least place them in a state of great dependence in relation to the former. If such a decision had already been given, a kind of monopoly under the leadership

of the A.E.G. would have been formed, with the Pintsch Co. as the sole opponent. The latter makes metallic-filament lamps on the squirting process, which is declared to have been considerably improved in recent times, and it is assumed that this fact also has contributed towards the understanding.

It may be remembered that at one time the A.E.G. claimed the right to the designation of glow lamps as wire lamps exclusively for metallic-filament lamps produced by the drawing process, and the company succeeded in this contention in an action brought against the Pintsch Co. a few years ago. The former group argued that the term wire lamp was evidence of quality, whereas the latter submitted that the use of the name by the Pintsch Co. was justified through its having come into common use amongst consumers, especially as the company maintained that its squirting system had advantages over other methods. At any rate, the A.E.G. group gained the day.

It was, however, in another direction that this group possessed the greatest strength from an economic standpoint—in fighting outside makers, namely, from the combination of most of the installation and electricity supply branches in the hands of the great electrical undertakings. As a result of this practice, the group was able to provide a market for its products which was not endangered by competition, as the group was able to make it a condition of the supply of current that lamps and other installation materials should also be obtained from the same source, the consequence being that the market possibilities of the remaining firms were proportionately restricted as the strength of the joint undertakings increased.

The French Electrical Industry.

A FAVOURABLE opinion, respecting the prospects of the electrical engineering industry in France is entertained by M. Laurent, president of the Compagnie Française pour l'Exploitation des Procédés Thomson-Houston. It appears that large extensions of the company's works have been carried out during the past year, the volume of business has been greater, and the profits realised have permitted of the payment of a dividend equal to that which was paid in the last few years preceding the war. Not unnaturally the question arises as to whether this development will come to a standstill or, at all events, slacken, after the cessation of hostilities. The view of M. Laurent, which was put forward at the annual meeting held recently, is that everything points to the development being maintained. The difficulties which have arisen owing to the inadequate coal resources in France have clearly shown in recent months the necessity for substituting water power for coal as much as possible now, and also in the period after the war, when many urgent requirements will arise. In this connection, the president of the company in question considers that an almost unlimited field for the manufactures of the electrical engineering industry will be opened up by the establishment of new hydro-electric works, the conversion of a part of the railways to electric traction, and the numerous applications, which are tentative to-day, but will be assured to-morrow, of electric power to the chemical and metallurgical industries. At the same time, the invasion by German products will be at an end in the French home market, and in those of the Allies. It may also be necessary to extend and modernise the telephone system, which is deemed to be quite inadequate for its purpose, whilst the telephone and telegraph installations in the departments invaded will have to be re-established. It is, therefore, concluded that the future will be a time of great activity, for which preparations must be made at the present time.

STAFF ORGANISATION IN ELECTRICITY SUPPLY UNDERTAKINGS.

[COMMUNICATED.]

MUCH has been written on the subject of organisation in electricity undertakings, but no attempt has, so far, been made towards the standardisation of designations in connection with staff positions in these undertakings. The reason for this is probably that local conditions vary so much, and what is regarded as an important position in one municipality may be of little consequence in another. Very often when an electricity official makes inquiries in another city or town regarding the status of the gentleman holding a similar position to his own, he finds that there is no position there exactly the same as his own. The appointment nearly comparable with his is held by an official who possibly has greater or less responsibility than the inquirer.

In our issue of May 4th, 1917, was published an article under the heading of "Promotion in Electricity Supply Undertakings," in which the duties and responsibilities of electricity officials were set forth. The remarks contained therein were based on the supposition that the following system of staff organisation was adopted. This system should be found very suitable for undertakings having a plant capacity of between 10,000 and 50,000 KW.:—

CHIEF ENGINEER AND MANAGER.

CHIEF ASSISTANT.

STATION ENGINEER.

BOILER-HOUSE SUPERINTENDENT.

Technical Assistant.

Charge Engineers

{ Shift Engineers.
Switchboard Attendants.
Drivers.
Firemen.
Trimmers.

Fitters.

ELECTRICAL SUPERINTENDENT.

Sub-station Superintendent.

Sub-station Attendants.

Electrical Fitters.

MAINS ENGINEER.

ASSISTANT MAINS ENGINEER.

Records Draughtsman.

Records Clerk.

Jointers.

Foremen.

CHIEF DRAUGHTSMAN.

Draughtsmen.

SECRETARY.

CHIEF CLERK.

Book-keepers.

Typists.

CONSUMERS' ENGINEER.

METER SUPERINTENDENT.

Meter Testers and Repairers.

Meter Readers.

INSTALLATION SUPERINTENDENT.

Foreman

Electrician.

{ Wiremen.
Installation Inspectors.
Motor, &c., Inspectors.

Showroom

Assistant.

{ Canvassers.
Salesmen.
Clerks and Typists.

Public Lighting

Foreman.

{ Linesmen.
Trimmers.

For small undertakings below 10,000-KW. capacity many of the positions could be combined, while for large systems of over 50,000 KW., although the general scheme as outlined would be appropriate, new subordinate appointments would be necessary.

The question of salaries pertaining to the more important appointments is a matter which should receive more attention than is given in a large number of undertakings. Great divergencies in this respect are shown by a study of the emoluments in various undertakings throughout the country.

In one municipality the salaries of the electricity staff may be arranged on a reasonably graduated scale from the chief engineer downwards, while in another the chief engineer possibly receives a handsome salary, out of proportion to the small salaries of his several departmental assistants next in authority under him.

The rapid growth in the size and importance of electricity undertakings within recent years warrants a careful survey of the remuneration given to the officials responsible for the efficient and economical generation and distribution of electrical energy, which has proved such an important

TABLE OF AVERAGE SALARIES.

Designation.	2,000 KW. capacity.	5,000 KW. capacity.	20,000 KW. capacity.	50,000 KW. capacity.
Chief engineer and manager	£100	£500	£1,000	£1,500
Chief assistant	250	300	500	700
Station engineer	200	230	400	600
Boiler-house superintendent	—	—	250	300
Electrical superintendent	—	—	250	300
Mains engineer	180	200	350	500
Assistant mains engineer	—	—	250	350
Chief draughtsman	150	180	300	350
Secretary	130	160	280	300
Chief clerk	—	—	200	220
Consumers' engineer	200	220	350	550
Meter superintendent	—	—	220	300
Installation superintendent	—	—	220	300

factor in the manufacture of munitions of war. The accompanying table of average salaries has been compiled with the view of determining the relative values of the services of those electricity officials who have had, through force of circumstances, to keep to their jobs during the present war.

TARIFFS IN THE ABSTRACT.

AT the present time, when our American friends are discussing the simplification of their tariffs for electric supply—a matter which, judging from the samples quoted in their papers, should present little difficulty—we can the more readily congratulate our own supply authorities on having in so many instances been able to institute simple tariffs, understandable by the average consumer, and yet so drawn up as to safeguard those technical essentials which are necessarily factors in a commercially successful tariff.

Any tariff scale, however simple, is in effect an attempt to average out the value of the service rendered to a particular class of consumer: the simpler the tariff—assuming always that it has been determined on technical and commercial considerations—the greater the number of determining factors which have been averaged out, while a complex American tariff, such as the following, which is supposedly intended to cultivate electric cooking on the low rate, is an attempt to meet each individual phase of the consumer's demand or service with an equivalent rate value:—

American rate based on active rooms; has a primary step of 10 cents per KW.-hour for 4 KW.-hours for each of the first four active or counted rooms, and for 25 KW.-hours for all additional counted rooms; a secondary step of 5 cents per KW.-hour for all energy over that paid for at the primary step up to a total of 7 KW.-hours per counted room, and a third step of 2 cents for energy consumed per month over 7 KW.-hours per counted room.

This tariff is designed for the same purpose as our own "Domestic" tariff of, say, "12½ per cent. of the rateable value of the house plus ½d. per unit," which has been obtained by broadly averaging the determining factors affecting value of service and applying them in a form which is simple and can be understood by the consumer—i.e., in a commercial form.

In comparison, the American tariff is unwieldy and uncommercial, and though we grant that it may be more scientifically correct, its equity, nevertheless, depends on the accuracy with which the average service value of each step, for the particular class of consumers concerned, has been determined.

When we consider that the cost of a KW.-hour supplied to a particular consumer depends on the distance and method of delivery, the time at which, and during which it is delivered (i.e., the effect on the generating plant of the incidence of its delivery as regards the supply of energy to other consumers), as well as on the degree of efficiency of the generating plant, and sundry other lesser technical and

operating considerations which, though pregnant with significance to the engineer, are as Greek to the consumer, and that the tariff has to perform the dual function of embodying the complex desires of the former in the simplest possible form which will appeal to the non-technical imagination of the latter, it will be obvious that it must in every case, irrespective of its simplicity or complexity, be an abstract assessment of value of service, based on a complex average.

The engineer, recognising the practical impossibility of framing any single tariff which will meet the conditions of all consumers, proceeds to classify the latter into grades, nominally according to the average cost of service for each grade, but frequently according to the average commercial value attaching to the service, which may be greater or less than the cost, and depends on the commercial policy adopted by the supply authority.

In any case, the exact cost of supplying an individual consumer is indeterminate, unless he is the only consumer, or each individual consumer has a fixed load characteristic relative to the others, and it is conceivable that, under certain conditions, a group of a dozen consumers, with a great diversity of load characteristic, might be supplied at even less actual cost than one consumer having the desirable all-day load.

Tariff classification has its drawbacks, for the wider the average of a class is drawn, the greater the variation in actual cost as between good-paying and bad-paying—possibly unprofitable—consumers; true, the latter may, by reason of the assistance rendered by the former, more readily develop their demand into a paying load, but meanwhile the development of the former as a sub-class is held up.

To the engineer, tariff classification is an expedient based on imaginary zones of service value: the actual cost of generating electricity is, on the other hand, a very real thing, though varying from hour to hour according to the effect on the plant of the incidence of the individual consumers' loads. The consumers' loads may be likened to the parts of a jig-saw puzzle, which, when fitted together, will give a connected and uniform result: the greater the degree of perfection attained in the fitting together, the less the cost to the generating station, irrespective of the size of individual loads.

This does not mean that a small consumer can be supplied at the same rate as a large one, because obviously distribution and connection charges affect the result, but it does mean that it may be no more costly to supply a number of short-hour consumers having a considerable load diversity, than one long-hour consumer, provided the former utilise the generating plant to the same extent, and do not incur excess connection charges, and that discrimination against the short-hour consumer, just because he is a short-hour consumer, is not justified.

Clearly, it does not concern the generating engineer where the output goes which gives him his 40 per cent. load factor, provided he can keep to that condition of affairs: similarly, it matters not a jot to the supply authority that an individual consumer is of the short-hour type, provided that his load with the others, short or long, assists in producing a long-hour demand.

Most supply engineers, from technical considerations, regard the peak load as the bone of their existence, and if anathema could hinder what is, after all, a normal development of supply, there would be no peak-load consumers. The general supply has always had a peak load, and probably always will have one of a kind, at some time during the 24 hours, and it is absurd to condemn the consumer—often enough it is the beloved long-hour man—for doing just what you have asked him to do, viz., make as much use as possible of the supply.

The consumer can legally command a supply of electricity at any time, and the engineer must, perforce, provide plant to meet such requirements; that this plant is unused for many hours in the day is surely the fault—if fault it can be considered—of users at other times of the day who are not sufficiently enterprising to make use of that which is necessarily provided.

The tariff scale, as a rule, is such as to encourage the long-hour consumer, or class of consumer giving equivalent

conditions, a premium being placed on "duration of use," with or without restriction of demand.

To restrict the demands of individual consumers during the day is to accentuate the evening peak, and it would be more logical to encourage peaks during the day to counter-balance that during the evening. This object is, of course, more or less achieved by the domestic tariffs of the "point five" type, as also by rates which place a premium on "time of use" off the peak.

In this connection domestic tariffs which have no demand restriction, and offer a low uniform secondary charge, appear to offer great possibilities, as although the consumer is unhindered as to the use of energy at any time, it is evident that a practical limit exists to his lighting requirements, while the limit of his requirements for other purposes, largely during the day, for which such a tariff directly caters, has not yet been ascertained.

On the other hand, it is probable that the ordinary separate lighting tariff is an indirect cause of the peak load, because the ordinary lighting consumer has the impression that each unit costs, say, 4½d., and that he must economise, which he does by restricting his use to peak-load hours: if he should realise that a lower heating rate is available, the disproportionate initial cost of taking advantage of it must be a serious deterrent.

The prospect of developing the heating and cooking load looms so very largely in the future, that one is tempted to speculate as to the ways and means of hastening it.

It seems probable, for instance, that if 75 per cent. of the householders in a street containing, say 100 houses, were to combine and co-operatively purchase energy in bulk for resale at cost price to themselves from the supply authority, at the same time guaranteeing a certain average wattage of heating or cooking apparatus installed, this group of consumers would progress electrically at a much greater rate than the average consumer throughout the area. The street would offer a favourable load, and any improvement brought about by this progressive group of consumers would be reflected in a reduction of charges to them, thus tending to still further development. The supply authority would obtain its most favourable conditions—viz., long-hour use and concentrated load—the street being equivalent to an American apartment house. If these same consumers were to purchase or hire their apparatus co-operatively, they would at the same time reduce the initial cost of their venture.

Any street or residential area of suitable character, in which a sufficient number of householders agreed to the conditions, could be dealt with on similar terms, a co-operative domestic rate being instituted for the purpose. In effect, such a scheme would sort out the good consumers from the bad and indifferent, rewarding them as a class according to their merits, and intensify and hasten on the domestic use of electricity and electrical appliances amongst those sections of the community most suited for the purpose.

Some towns possess areas suited to intensive development, and some do not; and whereas it is impracticable to apply intensive development on a scale suited to a whole city, it is reasonable to assume that such development is possible in the case of a selected section of the community, and that it might result in a type of super-domestic consumer, whose example and experience would be of great value as an incentive to less enterprising consumers, who would all along benefit indirectly from the general improvement in conditions of supply of energy and apparatus.

A New Power?—According to *Indian Engineering*, Mr. J. A. Hamilton, during the course of a speech at the annual meeting of the Central Engine Works, Singapore, observed that a new discovery had recently been made which, it was said, would completely revolutionise all the known systems of power transmission. "The possibilities of this new system have been readily recognised by the War Office and the Admiralty, and the commercial world has therefore been ignored entirely; in fact, the whole output is taken up for war purposes, and the Germans on the Western Front know to-day that some new power has been discovered, and have been speculating as to what it is. After the war, this system will be available; it will revolutionise all forms of power transmission, and will be highly beneficial to rubber estates, tin mines, and to all power users."

COAL TRANSPORT REORGANISATION SCHEME.

As is well known to the majority of our readers, one of the pressing questions brought about by the conditions of the moment is that of ensuring the coal supply of the community.

This is largely a transport difficulty, and, in order to overcome the latter, the Controller of Coal Mines has devised a scheme, which is to come into operation on September 10th, whereby it is estimated that no less than 700 million ton-miles will be saved annually in the transport of coal by public railway.

Great Britain has been divided into 20 areas, and the scheme relates solely to that portion of the coal which is being transported from area to area for inland consumption. In other words, it bears chiefly upon coal which is being conveyed for long distances or cross-country journeys, both circumstances being prolific sources of trouble in view of depleted railway staff and rolling-stock of all kinds.

This scheme, being designed to relieve transport, is based on four main issues:—(1) That consumption of coal should take place as near the producing point as possible; (2) that in view of the superior facilities afforded by the main trunk lines, the movement of traffic should follow these routes wherever possible; (3) that the movement of coal should, as far as possible, be in well-defined directions, viz.:—North to South, North to South-east, North to South-west, East to West; (4) that an area producing less coal than suffices for its own needs should not send any portion of its output to other areas; and that an area producing more coal than it requires for consumption within the area itself should only distribute the balance to adjacent or convenient areas.

The only limitation in regard to Clause 4 is the need for providing fuel of a special type for certain purposes, and this need has been determined by getting into touch with consumers direct. In this connection arrangements are being made for the issue of certificates authorising supplies of coal of a special type required by steam raisers for special purposes—e.g., mechanical stokers, gas producers, &c.—and collieries, factors, and merchants will be precluded from supplying special grades to consumers in the absence of a certificate issued to the latter by the Controller of Coal Mines.

In the various areas District Coal and Coke Supplies Committees are acting as the Controller's representatives in all matters relating to coal. These Committees have been empowered by the Controller to conduct the necessary arrangements for putting the new scheme into force. It is considered that a minimum of inconvenience will thus be caused to all concerned, as collieries in each area will thus be placed in direct touch with the factors, merchants, and direct consumers whose supplies they will have to provide in future. There will consequently be no necessity for those whose supplies are affected under the scheme to proceed in search on the one hand of new customers, or, on the other, of new collieries. As a safeguard, however, should any factor, merchant, or direct consumer not hear from a colliery by August 27th, 1917, that it is authorised to send supplies, a communication may then be made to the District Coal and Coke Supplies Committee concerned, stating full particulars, in order that inquiries may be conducted and arrangements made for supply before the scheme comes into operation throughout Great Britain on September 10th, 1917.

The movement of coal within the areas themselves—i.e., coal produced and consumed in the same area—remains undisturbed, and contracts will not require to be cancelled.

In the case of coal affected by the scheme, however, existing contracts will be cancelled at 6 p.m. on Saturday, September 8th, and new contracts, to be arranged between now and that date, will come into operation on Monday, September 10th.

Not only should the new scheme result in reducing congestion on the railways, but it ought to assist the coal trade generally in getting a better turnover for their wagons, and tend to minimise stoppages at collieries due to delays in the working back of empty wagons over long distances, or from awkward points involving cross-country working.

In developing the scheme generally there has been a free interchange of views with the District Coal and Coke Supplies Committees as representing the colliery owners, and meetings have taken place with representative factors and merchants, and the Controller is also in touch with the Railway Executive Committee with a view to ensuring that adequate arrangements are set up to meet changed directions in the flow of traffic.

All concerned are strongly advised to secure the map diagram reproduced herewith, and the pamphlet, as referred to in the official notice, as these documents will be found to be of material assistance.

It is emphasised that this scheme does not affect water-borne coal, either export, coast-wise or bunkers, anthracite or coke of any description.

It is anticipated, from inquiry, that very few industries will experience difficulty.

At a recent meeting at which the scheme was explained, the question of varying the local health regulations, in view of the mixed quality of the coal which may be supplied, was raised; it was also pointed out that there should be some protection for the consumer in regard to price, and that the Price of Coal Limitation Act had not proved very satisfactory in this matter.

Maps have been prepared showing the division of Great Britain for coal distribution purposes, and an explanatory memorandum

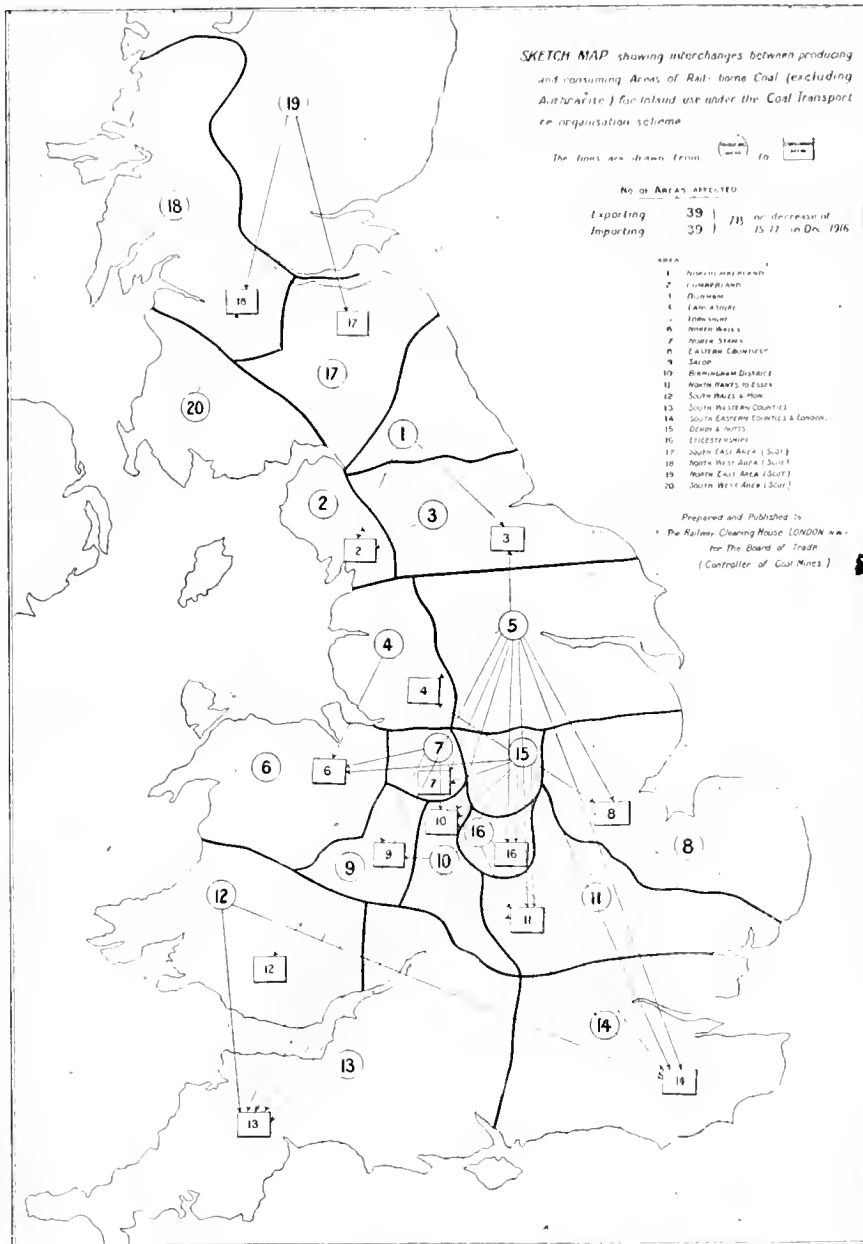

DIAGRAM SHOWING PROPOSED COAL TRANSPORT SCHEME.

contains particulars of the areas to which the forwarding of coal for inland consumption is confined, for (1) steam and manufacturing; (2) gas and coking; (3) domestic use. It also contains a list of District Coal and Coke Supplies Committees responsible for the various areas, and a list of places which are just within the scheduled areas.

40,000 Electrical Employees Subscribe to the War Loan.

—As an indication of the general interest of electrical workers in America in providing the sinews of war, the following information taken from the *New York Times* is illuminating:—40,000 employees of the General Electric Co., of New York, have subscribed for \$3,000,000 worth of "Liberty Loan" bonds, an average of \$75 per individual. The subscriptions were received from the Schenectady, Lynn, Harrison, Fort Wayne, Erie, Pittsfield and other works of the company, as well as from their district offices, and are symptomatic of the attitude of the whole of America.

TAR OIL FUEL AND DIESEL ENGINES.

By GEOFFREY PORTER, A.M.Inst.C.E.

(Abstract of paper read before the DIESEL ENGINE USERS' ASSOCIATION.)

WITH the adoption of an oil fuel other than residual petroleum oils or shale oils has not recommended itself until comparatively recently, owing to the favourable terms on which we have been able to obtain imported residuals. But the force of necessity has compelled us during this period of war to look elsewhere for fuel supplies. Such sources exist in the coal deposits of our own richly endowed land, and they are being brought into utilisation by native talent and skill. It is not impossible that we are on the eve of freeing ourselves from our former dependence upon other countries for supplies of suitable fuel oils.

Mr. Day and Mr. Batho have quoted specifications for tar oil which may be regarded as standard. These specifications I incorporate at this point.

Specification proposed by Mr. C. Day (January 19th, 1916):—

The tar oil must be a product of the distillation of coal tar. No product that has not undergone distillation must be present.

Per cent. insoluble in xylol	...	not more than	2'0
" ash	...	"	0'80
" water	...	"	2'5
" coking residue	...	"	3'0

The oil must be liquid at 60° F. when maintained at that temperature for half an hour. In case of crystals settling in the transport tank, the buyer to be allowed to drain off the liquid portion and to return the solid to the seller.

Mr. Day pointed out that the calorific value of tar oils as determined by numerous tests is not a very variable quantity, and suggested that a definite heat value should not be stated in the specification.

Mr. Batho put forward a specification for tar oils at the Diesel Engine Users' Association meeting of February 23rd, 1916, in the course of remarks he then made, as follows:—

Specific gravity...	...	Between 1'0 and 1'1.
Viscosity	...	Generally 2° Engler (all coal tar oils are very fluid).
Flash point	...	100° F. to 130° F.
Colour	...	Tar oils are, as a rule, dark to almost black. One drop on white paper should show no black residue, as is the case with tar. This black residue means a large percentage of free carbon or other tar ingredients.
Lower calorific value	...	Between 15,800 and 16,500 B.T.H.U. per lb.
Ash	...	Should not exceed 1 per cent. (unburnt residue of tar oil is mostly harmless).
Water	...	Should not exceed 1 per cent.
Sulphur	...	5 per cent. to 1 per cent.
Pitch	...	If the tar oil contains a high percentage of residue which only begins to vaporise at 400° C., one must anticipate a considerable amount of dirt in the engine, and the exhaust valves will require frequent cleaning and grinding in.

The tar oils supplied agree in substance fairly closely with the specifications. It is desirable, at the present moment, not to draw a specification for tar oil too tightly. So far as the demand for these oils in connection with Diesel engines is concerned, it is a new one in this country. Tar oils for our purpose are not yet standardised, and it is too early as yet to draw hard and fast lines. The products we are obtaining are, in general, giving satisfactory results. I have not heard that any difficulties have arisen that are attributed to specific gravity.

I understand that the water content is difficult to determine, chiefly because of the peculiar property of water to collect in pockets in oil. Hence a sample may not be representative of the bulk, and *vice versa*. Further, the oil enters into ebullition at 212° F. Tests of water content must, therefore, be accepted with caution. Owing to the high specific gravity of the tar oil, water is not so troublesome in ordinary engine operation, as it rises to the top of the service tanks. With petroleum residual oil the reverse is the case, and water occasionally will stop an engine if the attendant is not careful.

The coke residue item must be carefully studied. I have seen tests which indicated a coke content as high as 26 per cent. Such an oil would be unsuitable for use in a Diesel engine.

As suggested by Mr. Day, the calorific values agree fairly closely with one another and with the specifications. The lower calorific value is the important one. Below a value of about 15,800 B.T.H.U. per lb. the oil is unsuitable for use in Diesel engines.

The proportion of the constituents insoluble in xylol is an important matter. It is essential to reduce the amount of suspended solids in the oil to an absolute minimum, for they form nuclei for the formation of deposits which carbonise and give rise to difficulties in working an engine. ("Xylol" is described as dimethyl benzol, and has the chemical formula C_8H_{10} ; its boiling point is 133°.)

The M.A.N. specification requires the oil to remain liquid at a temperature of 46'5° F., when it is undisturbed for a period of half an hour, and to be fully liquid at 61° F. Mr. Day's specification concurs. Those of us who have been using tar oils for the first time during a particularly cold winter have learned by experience that this desideratum is not merely a chemist's fad. At a temperature below 45° F. crystallisation is heavy. In one instance I found fully 30 per cent. of the contents of a tank of oil (out of doors), containing 11 tons, to be extremely thick. It could not be pumped at all. Heating a gallon drawn out in a pail dissolved the crystals, but to heat the whole tank was impracticable. Finally the difficulty was overcome by violently agitating the bulk, when the oil became fluid. This method was adopted throughout the winter as occasion required; it cost nothing, and was quite successful. From our experience up to the present one fact emerges, *i.e.*, that tar oil is better stored under cover in a moderately high temperature than in the open.

I have been particularly interested in examining indicator cards of engines burning residual petroleum oil, tar oil alone, and tar oil with the addition of a pilot jet of residual petroleum oil. The use of tar oil produces greater temperatures than does the use of a residual petroleum fuel oil, but the increase is not of high value when allowance has been made for the slower burning property of tar oil by advancing the fuel admission. The starting cards I have been able to obtain appear to be normal; I have not detected any difference of consequence between such cards taken from engines running on the fuels mentioned. In the engine fitted with pilot jet ignition gear under my own charge sudden pressure increases occur occasionally at starting.

Nearly all the cards in my possession, taken at fairly high fractions of full load, are of good shape. I believe that all of us who have used tar oil, with or without pilot jet ignition gear, have found it necessary to advance the fuel admission, the setting for residual petroleum oil being generally too late for the slower burning tar oil. In general, a card taken from an engine using tar oil with pilot jet ignition is not so nicely shaped as a card taken with residual petroleum alone, or with tar oil alone as fuel. The prior ignition of the pilot jet produces a "peaked" admission line in comparison with the regular, slightly drooping curve, which denotes combustion at constant pressure.

My own experience has been with an engine equipped with Messrs. Mirreles, Bickerton & Day's pilot jet ignition gear, and most of my remarks will refer to this engine. The tar oil supply is delivered by the main fuel pump to the cylinders under the control of the governor. The ignition oil is independently supplied, but is not under control of the governor. The quantity of ignition oil is a fixed amount at all engine loads. The ideal quantity is 5 per cent. at full load. The quantity of oil delivered by the ignition pump is set by an arrangement which permits the same adjustment to be given to each pump, each cylinder having its own ignition pump. As the ignition pump is not controlled by the governor, it is advisable to set the governor to keep the engine speed if anything on the low side, as the engine may "run away" when the load is thrown off suddenly. The smaller the quantity of ignition oil used, the less probable is this condition. The provision of some electrically-controlled safeguard in connection with the ignition oil supply would be a desirable feature to adopt. In starting, the engine invariably runs out 20 to 30 revolutions above normal speed. I have run the engine on 4 per cent. of normal full load on the fuel supplied by the ignition pumps alone when set to deliver their maximum quantity.

In fitting these pumps, too much care cannot be taken. Fitted studs and steady pins should be used to preclude the possibility of any movement of the pump body. The adjustments are so fine that even a little shake will affect the oil delivery.

In the ordinary course of running the engine (driving a dynamo direct-coupled) I find the speed control by the governor to be as satisfactory when using tar oil as when burning residual petroleum oil. Impulses are regular; it is seldom that a cylinder "misses"; and one would not be aware that a change of fuel had been made. The engine runs well even on $\frac{1}{10}$ load.

Before commencing the use of tar oil, one or two adjustments must be made. An earlier fuel admission is necessary, owing to the slower burning properties of the oil as compared with residual petroleum oil. I think the amount of the advance depends on the quality of the fuel. In my own experience, I find an advance of about 1° on the crank circle suffices. Similarly, the closing of the needle valve needs a rather earlier adjustment. The only definite method to adopt is that of trial and error. As with residual petroleum oil, the condition of the colour of the exhaust is a guide to correct timing. I have had no difficulty in obtaining colourless exhaust at all loads with injection pressures of the same magnitude for tar oil as for residual petroleum oil. When attempting to use tar oil without ignition gear, I found it necessary to reduce the injection pressure to a large extent in order to obtain satisfactory operation. Those engineers who use tar oil as the sole fuel have also found the reduction of the injection pressure essential for steady operation.

Another important point to consider is the compression pressure in the cylinders at no load. This pressure should not be less than 480 lb. per sq. in. Below this figure, both the ignition of the tar oil and of the residual petroleum oil may be uncertain; and even if regular ignition is obtained, combustion may be incomplete, leading to smoke and high exhaust temperatures. The engine in which I am interested had been at work for a period of 14,000 running hours before being adapted to tar oil fuel. Nevertheless the engine has done consistently good service, using tar oil, for the past nine months, in April last being at work at 65 per cent. of full load (average) for 497 hours, or 16½ hours per diem. Mr. Prentice has also obtained very consistent working with the engine he is

operating with tar oil without a pilot jet. He informs me that the engine has been operated for 2,250 working hours at $\frac{1}{2}$ of full load during nine months, or about 8½ hours a day.

I think it very desirable to fit relief valves to the cylinders when using tar oil. Increases of pressure do occasionally occur at starting, and it is essential, in my opinion, to take all reasonable steps to avoid adding to the already high stresses in the engine parts. The relief valves are set to lift at 750 lb. per sq. in. In the event of a number of "misses" causing an accumulation of fuel on the piston head, and this accumulation suddenly firing, very considerable excess pressures may arise. It is improbable that any relief valve will prevent an explosion, but it will give useful warnings and will take care of all minor pressure troubles.

Pistons become very dirty; the rings become fast in their grooves, and should be examined at three months intervals. The exhaust valves give no trouble. They are cleaned and ground-in at intervals of 250 running hours. I am still using the original exhaust valves supplied with the engines five and a-half years ago. The fuel pumps are rather more troublesome than formerly, owing to the greater amount of sludge found in them. The lower viscosity of the tar oil also renders it more difficult to maintain the plunger glands tight than was the case when using residual petroleum oil.

In the pulverisers we have endless trouble owing to the choking of the cone grooves and rings. Frequently also the passages in the fuel valve casing become choked. The deposit collects rapidly; under the conditions I am familiar with, the deposit must be removed after 50—60 hours' running at about 65 per cent. of full load. If the fraction of full load is greater, the deposit forms more rapidly. This difficulty is very generally found by engineers using tar oil. All tar oils do not show it, and others do so in varying degrees. On some days the deposit is very slight, at other times very heavy; sometimes exceedingly hard, and again very soft. Some engineers have told me that their pulverisers have choked in 12 hours and less. In some instances the deposit is normally so great that it is necessary to reduce the full-load rating of the engine. In my own case the deposit has been less since the warm summer weather set in, and this inclines me to suppose some connection between the crystallisation of the oil in the storage tanks and the deposit in the pulverisers. The cause of the deposit is still obscure. Several engineers have completely got rid of deposits by adopting another pattern of pulveriser. A type which secures the pulverising of a film of oil appears to be satisfactory. In my own case, the choking of pulverisers is merely a nuisance, for other engines are available when the engine burning tar oil is shut down to clean out pulverisers. But for an engineer who cannot ring the changes on his plant, the matter is something far more serious than a mere nuisance.

Another small point from personal observation is the sweeter running obtained by increasing the injection pressure at all loads by about 20 lb. per sq. in. The "cadence" of the engine and the operation of the top gear are then very much more regular. No doubt pulverisation is improved, the impulses are more even, and the governor runs more steadily.

Finally, tar oil is very unpleasant to handle; it is very fluid. The standard of engine and engine room cleanliness, and also of personal cleanliness, is much more difficult to maintain than was the case with residual petroleum oil. I fear that the filthy properties of the oil are inherent, and must be borne with in a philosophical spirit in view of the commercial advantage accruing from its use.

My own engine (fitted with pilot jet ignition gear) has provided the following results from September, 1916, to the end of April, 1917:—

Hours running	...	2,671
Average load	...	58.5 % of full load
Weight of oil fuel per kw.-hr.		
(tar oil and resid. pet. oil)		826 lb.
Pet. oil as per cent. of tar oil		14.9 % by weight
Estimated saving by comparison equiv. cost of pet. oil		494d. per kw.-hour (in cash, £372 7s. 9d.)

On an investment of £160 (the cost of fitting the gear) the return is a handsome one.

The following figures from the daily records relate to fuel consumptions at various fractions of full load, and include both tar oil and the pilot jet oil:—

At 34½ % of full load	...	1.64 lb. per kw.-hour.
" 42 % "	"	1.02 "
" 67½ % "	"	.70 "
" 74 % "	"	.66 "

The next table states the percentage of petroleum oil to tar oil at various loads, in accordance with the adjustments adopted in the ignition oil pumps:—

At 20—29 % of full load	...	17.5 %
" 40—49 % "	"	16.4 %
" 50—59 % "	"	15.0 %
" 60—69 % "	"	13.9 %
" 70—79 % "	"	13.3 %

If these figures are plotted on squared paper a straight line results, as should be the case, and if the line is continued to ascertain the percentage at 100 per cent. of full load one finds 10.3 per cent. as the proportion of petroleum oil at that stage.

I have run the engine many times on lower proportions of petroleum oil, but found that firing was at times uncertain. Ultimately I fixed upon the proportions stated above. I am afraid 5 per cent. is only attainable under ideal conditions.

The figures given in the two tables below relate to a pair of exactly similar engines (under my control), the one burning residual petroleum, the other tar oil with a pilot ignition jet. Higher efficiencies are obtained with the oil of the lower calorific value. I assume the result has its origin in the fact that the residual petroleum oil we are now obtaining has a lower heating value than the oil obtained before the war broke out.

FUEL OIL—RESIDUAL PETROLEUM.

	Running plant load factor.	B.H.P. per kw.-hour.	Overall thermal efficiency.	Cost of fuel, pence per kw.-hour.
1	...	32.1 %	15,650	21.7
2	...	17.1 %	15,480	21.8
3	...	61.2 %	13,370	24.1

FUEL OIL—TAR OIL WITH PILOT JET IGNITION 10.3 % AT FULL LOAD.

1	...	36.3 %	15,005	22.6
2	...	47.2 %	13,229	25.79
3	...	19.5 %	15,205	24.23
4	...	62.4 %	12,615	28.9

These figures are not the results of trials, but are taken from the daily records, and are put forward as an example to indicate approximately the limits within which results may be expected to lie. A few figures giving the reductions in fuel cost in power stations follow:—

1. Engines using pilot jet ignition gear:—

(a) Reduction of fuel cost	...	£12 10s. per week
(b) " " "	...	35d. per kw.-hour
(c) " " "	...	49d. per kw.-hour

2. Engines burning tar oil without pilot jet gear:—

(d) Reduction of fuel cost	...	26d. per kw.-hour
(e) " " "	...	400d. per kw.-hour

Owing to varying rates paid in different localities for tar oil and residual petroleum oil the above figures are not strictly comparative. I have been able to work my three engines without pilot ignition when they are loaded above 70 per cent. of full load. I am not able to guarantee so high a load factor for many hours consecutively, and I found that variations of load gave rise to very unsteady running. I therefore adopted the pilot ignition gear, which enables the engine adapted to operate steadily at all fractions of full load. I also attempted to operate with mixtures of tar oil and petroleum residue oil, obtaining fairly favourable results when using an even mixture of the two fuels. Difficulties arose in the course of time, and I came to the conclusion that the method was a dangerous one.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

Electric Furnace for High Temperatures.

An electric furnace in which can be obtained a temperature up to the melting point of platinum is almost an indispensable piece of apparatus in any laboratory. A suitable one is not easily obtained at a price that is not prohibitive.

The furnace shown in fig. 1 is simple in construction, inexpensive, and comparatively long-lived. The heating unit of this furnace is

FIG. 1.—SECTION OF ELECTRIC FURNACE.

a helix of Acheson graphite made by sawing around the tube, the material sawed out being replaced with aluminum cement, forming a solid tube which is comparatively strong and can be handled with ease without breaking. The aluminum cement also insulates one

turn from the other and prevents gases from passing through the helix. The one illustrated requires from 25 to 30 amperes at 100 volts for temperatures ranging from 1,100° to 1,500° C. Temperatures up to 2,000° C. are readily obtained.

The graphite resistance coil is confined in a space between aluminum tubes—graphite tubes may be used—to or from which gases cannot readily pass, and in which the gas constitutes an atmosphere in which the resistor element is chemically in equilibrium. The gases present and surrounding the resistor are chiefly carbon monoxide and nitrogen.

The body of the furnace is inexpensive and simple in construction, and if, when put together, the joints are plastered with aluminum cement, it is practically impossible for air to find its way to the graphite resistor, which is readily oxidisable in air above a red heat.

In this furnace, the author has made 36 heats ranging in temperature from 1,100° to 1,600° C., each for a period of five hours, making 180 hours of service. The furnace is apparently in good shape yet. When it gives way a new one is readily put in its place by removing the top iron plate, the fireclay plate, and top electrode immediately below it, also the inner aluminum tube, if necessary. The new unit costs from 75 c. to \$1.—A. W. FAHRENWALD, in *Met. and Chem. Engineering*.

Starting Rotary Converters Connected to A.C. Circuits.

A method of starting rotary converters whereby a machine may be brought up to synchronism without causing any appreciable disturbance in the supply mains is described in patent No. 1,224,729, assigned to the GENERAL ELECTRIC CO., U.S.A., by L. Fleischmann. The method applies to a rotary converter which is mechanically connected with an induction motor having a phase-wound secondary. For starting, the motor is connected to the alternating-current mains as an induction motor. The slip-rings of the converter are also

FIG. 2.—CONNECTIONS FOR STARTING ROTARY CONVERTER.

connected to the mains but through resistance, so as to apply only a portion of the normal voltage to the windings. The direct-current end of the converter is then connected to the secondary of the induction motor to supply alternating current of slip frequency. A large torque is thus produced in the motor, which pulls it and the converter into synchronism. The converter may then be connected directly to the alternating-current mains, as it will be in phase, and to the direct-current buses, as it will have the correct polarity.—*Electrical World*.

Electric Submarine Camera.

The *Scientific American* recently described an electric submarine camera for deep-sea photography, which was tested with success on the U.S. steamer *Vestal*, and is the invention of MR. H. HARTMAN, of New York.

The apparatus consists of several cylinders in a rigid steel framework, fitted with a shock absorber at the bottom, and above it a gyroscope to give stability against vibration, which is run from a 12-volt battery in the same cylinder: the three upper cylinders are roughly horizontal, the top one containing a motor and propeller to give direction to the camera. The next one is the camera tank containing, in addition to the camera and its operative mechanism, a distribution board for wiring which is carried up to the deck of the vessel, and enables the camera to be operated from the deck electrically. The third cylinder is a searchlight projector, and both this and the propeller motor are operated through a cable from the ship. The apparatus weighs 1,500 lb. in air, or about 100 lb. submerged, and is suspended from a steel wire rope. About 100 amperes at 120 to 200 volts, according to depth, are required to operate the projector, motors, &c., and the apparatus promises to be of great assistance in securing information in salvage operations where diving is impracticable or difficult.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Electric Radiators.

With reference to the article entitled "Radiators," which appeared in your issue of March 2nd, it might be of interest to you to know that, as a result of three years' close investigation into the relative merits of various designs of heaters, I am in entire agreement with the principles laid down by "Experiment."

It is not usual to associate India with electric radiators and heating apparatus generally, but, as many of your readers know, in the northern parts of this country the winter is often very severe, and fires are required from October until April. In Simla, which is at an elevation of 8,000 ft., the cold is much more intense, and some form of heating apparatus is required practically all the year round.

As the Simla undertaking is hydro-electric, power can be supplied at small cost, and during the past three years we have made every effort to develop the use of electrical radiators and heating apparatus by our consumers.

When first going into this matter, we tried every well-known British-made radiator on the market: and, in addition, we experimented with some of American make. We found, generally speaking, that very few of the radiators gave good results, and this fact, combined with the difficulty we experienced in obtaining spare parts, led us to design and manufacture radiators of our own, for which patents have been taken out. These radiators are designed more or less on the principles laid down by "Experiment," as we have realised for some time that in a radiator it is radiant heat that counts. The results we obtained have convinced us that we get more useful heat per kilowatt out of the radiators made in Simla than it is possible to get out of most of the standard British or American radiators. This is proved by the fact that many of our consumers have returned British manufactured heaters with the request that these should be replaced by those of our own manufacture, and several consumers have informed us that our 1,650-watt heater gives off more heat than 2,000-watt heaters of certain British makes.

Heaters of our make have for some time past been used largely throughout Northern India, and the demand for them is steadily increasing.

In addition to the importance of using an element of suitable design, we have found it equally important to fix behind the elements a reflector of such shape that it will assist in directing the radiant heat in the direction required. Some manufacturers use no reflectors, and others adopt reflectors of a shape that assist but little in radiating effectively the useful heat developed in the elements.

Many manufacturers use the same type of element for different purposes, but I suggest that this is wrong, and an element should be designed to meet the requirements of the particular duty the heater is meant for. If it is to be used as a radiator to give off heat with the maximum efficiency to persons in a room, the type advocated by "Experiment" is the best, but if it is to be used for purposes such as drying clothes, warming plates in a hot cupboard, &c., then an element which gives off an excess of hot air is, if anything, to be preferred.

In conclusion, I would remark that the placing of a red lamp inside a radiator is very effective, for immediately the current is switched on, the whole of the interior is illuminated with a red glow which at once creates an impression of warmth. I have found that this little addition is greatly appreciated by consumers, particularly when radiators are used in the home.

India, June 5th, 1917.

Electro-Culture.

I trust that Mr. Leslie Miller's inquiry regarding steam static electric machines will be answered. I am afraid the voltage will not be enough, and the cumbersome nature of steam generation is a drawback.

I have made a six-plate Wimshurst which promises a considerable quantity of electricity with a 4-in. spark; the plates are 18 in. glass (cost 3s. each), revolving horizontally on ball bearings. Due to not having a lathe, I have been unable to get it on to the land this year; but I do think that for small experimental plots the Influence machine will be cheaper and safer to use, and the disadvantages mentioned in your splendid article in this week's REVIEW will be easily overcome with our present knowledge.

Can any reader give me the efficiency of a Wimshurst machine? It seems to me to be 100 per cent., except for a slight leakage (neglecting friction, which is practically only the air friction of the plates).

W. A. Turnbull

Electricity Works, Aylesbury.

Trading with the Enemy.—The *London Gazette* for July 6th contains further lists of persons and bodies in a number of countries with whom trading is prohibited.

REVIEWS.

The Driving of Machine Tools. By T. R. SHAW. London: Scott, Greenwood & Son. Price 4s. net.

This book embodies a series of lectures delivered by the author at the Royal Technical Institute, Salford, and deals with a subject of constantly growing importance; as the author remarks, "control is the essence of machine-tool operation," and in this respect the electric motor plays an ever more prominent part. The days when motors were simply belted or geared to machine tools of standard design are receding into the dim past—nowadays an electrically-driven tool, to rank in the first class, must be designed as a whole, the motor forming an integral part of the machine. The author takes a broad view of his subject, and deals first with the countershaft drive, using cone pulleys and gearing, the principles of correct design being fully explained, together with the characteristics of the work to be handled by the machine, and the methods adopted in practice to vary the speed. Next the all-gear drive, necessitated by modern conditions such as the use of high-speed steel, increased power, and loftier machine shops, is described in its various forms and degrees of complexity. A chapter follows on the applications of the individual motor drive, the well-known advantages of which are clearly stated. The types of motors available, and their respective adaptabilities, are discussed; the author shows that the motor need not be rated for continuous running—a two-hour full-load rating answers for all kinds of machine-tool applications—and that an extremely flexible range of speeds can readily be obtained with the minimum amount of gearing. Starting switches and speed regulators are also described. Other chapters are devoted to planing machine drives, in which the superiority of the electric drive is self-evident, shaping machines, boring mills, &c. The volume, which forms one of the "Broadway" series of engineering handbooks, provides an excellent review of the field outlined, and should prove of great assistance to designers, students, and others concerned with this subject.

The Mechanical Engineers' Pocket-book. By W. KENT, Sc.D., and R. T. KENT. London: Chapman & Hall. Price 21s. net.

Although American hand-books have a relatively limited circulation in this country, there are some which have attained a world-wide vogue; amongst these must be included this well-known work, which is now in its ninth edition, and is in many respects greatly improved. The contents are of necessity encyclopædic in range and variety, for the wants of the mechanical engineer are infinitely diversified; turning over the pages, one is almost bewildered by the mass of tables and concentrated information herein set forth. Such matter does not lend itself to general review, and a mere catalogue of headings would be of no advantage to the reader, while it would occupy an inordinate amount of space. The only true test of a work of this kind is that of use, and having kept it constantly at hand since its receipt, we can testify to its value as a desk companion.

The chapter on electrical engineering has been revised with the assistance of Mr. D. B. Rushmore, and occupies some 80 out of the 1,500 pages composing the volume; severe compression has been necessary to deal with this extensive subject in the space allowed, but some relief has been obtained by giving references to works where particular items are treated at greater length. The matter has been brought closely up to date, and the treatment is remarkably comprehensive under the circumstances.

Taking the book as a whole, it is characterised especially by its adherence to its purpose—to be a "reference-book of rules, tables, data, and formulæ"; unlike some similar works, it avoids extended descriptions of things, which are more appropriate to text-books, and confines itself mainly to working data. In other words, it is not a guide to the novice, but a companion to the practical engineer; as such, it has gained a reputation during its career of 22 years, to which no words of ours can materially add.

The Principles of Apprenticeship Training, with special reference to the Engineering Industry. By A. P. M. FLEMING and J. G. PEARCE. London: Longmans, Green & Co. Price 3s. 6d. net.

The reviewer feels that he owes an apology to the authors for having delayed so long writing his review of their most interesting and informing book. The fact is that he got interested in it, so that instead of reading merely the introduction and contents pages, and basing his review on these, he read it through, and forgot that he was a mere reviewer. The scope of the book is not limited, as might be inferred from the title, to the training which the engineering apprentice receives in the workshop, but deals fully with the practical and general education which a youth should receive during and prior to his workshop apprenticeship.

In his presidential address to the Classical Association, last January, Viscount Bryce, in discussing the chief aims of education, propounded two questions, viz.:—

1. "What sorts of capacities and of attainments go to make a truly educated man, with keen and flexible faculties, ample stores of knowledge, and the power of drawing pleasure from the exercise of his faculties in turning to account the knowledge he has accumulated?"

2. "How should the mental training fitted to produce such capacities begin?"

Now, Viscount Bryce was not discussing the education of the artisan apprentice, but of the boy who will subsequently graduate at one or other of our universities, but the reply he gives to his own questions might be applied with equal appropriateness to the one as to the other. The authors will probably agree that an education which commences on the following lines is calculated to produce as good an engineer as scientist, or diplomat. The mental training to produce the result outlined above should, says Lord Bryce, begin "First of all by teaching him how to observe, and by making him enjoy the habit of observation. The attention of the child should from the earliest years be directed to external nature. His observation should be alert, and it should be exact."

"Along with this he should learn how to use language, to know the precise differences between the meanings of various words apparently similar, to be able to convey accurately what he wishes to say. This goes with the habit of observation, which can be made exact only by the use in description of exact terms. In training the child to observe constantly and accurately, and to use language precisely, two things are being given which are the foundation of mental vigour—curiosity, i.e., the desire to know—and the habit of thinking. . . . What remains is to supply the mind with knowledge, while further developing the desire to acquire more knowledge. And here the question arises: What sort of knowledge?"

The answer to Lord Bryce's last question, so far as the engineering apprentice is concerned, is supplied in Messrs. Fleming and Pearce's book.

We have quoted the above not because the authors do not deal adequately with pre-apprenticeship training, but because the quotation conveys, in better language than the reviewer can command, the impression gathered from a careful perusal of the book as to the initial education which the authors consider desirable. It would be possible to quote many passages from the work under review bearing out agreement between the views of the authors and those quoted above, although the finished product is not the same; but one or two short extracts may suffice. Thus on p. 34:—

"The necessity for careful observation has been repeatedly urged by educational writers, but it is useless to expect boys to look at things which they do not understand, and to 'observe' them. If boys are to observe carefully, they must be first taught to know what they should see. . . . The observation which is valuable is that which involves notice of effects in order to appreciate causes."

In a chapter devoted to existing education in its relation to industry, the authors call attention to the fact that in the early stages "careful study of psychological processes has resulted in the introduction of methods of instruction more in harmony with the child's mind. . . . Interest and curiosity which children have in outside things is utilised to the full, and their co-operation in the process of learning obtained."

But although we appear now, as the authors suggest, to make a good start by adopting a system of primary teaching having a German name—the *kindergarten* system—the characteristic features of the system are not carried into the higher classes, and modern educational methods fail, in the authors' view, owing very largely to the fact that they are too "bookish and pedantic rather than practical." This, they consider, is the main reason for the mutual distrust existing between educationists and business men. The reviewer is not so sure that the term "mutual distrust" is quite the right one; the feeling is rather a one-sided contempt than anything which can be called "mutual." Nor, again, is the contempt directed against the bookish character of the education, but rather against its shocking inefficiency. How many boys, for instance, on leaving school and entering an office, can be trusted to add up correctly a simple money column, to spell ordinary words accurately, to address an envelope intelligently? Any business man will answer that the percentage is very small. This inefficiency of elementary education has a very retarding effect on progress in continuation and technical schools, as the teachers in these schools have to devote considerable time to teaching elementary subjects which form no part of the curricula of these schools. The efficiency of such schools is, therefore, lowered by the initial handicap under which they are placed, rather than by any inherent defect in the teaching methods.

The authors are rather severe on the evening technical school, which they frankly term a failure because, as they allege, the tuition given is of a character utterly unsuited to the character of the students who attend, or should attend, the schools. The other side should, however, not be lost sight of, namely, that the students who attend them are in great measure utterly unsuited to take advantage of the teaching which the evening schools can give them. The reviewer speaks rather feelingly on this subject, having spent many an evening teaching the rudiments of arithmetic to wiring students in order that they might understand elemen-

tary problems in electrical measurement. But what can one expect if boys obtain partial exemption from school between the ages of 12 and 14, and, after having wasted a couple of years in *cul de sac* occupations, begin to think it is time to learn a trade in which they hope to make their living? Soon they feel the need for some technical or trade teaching, and join an evening technical school, having forgotten in the meantime the elementary smattering of education they received at a primary school. It seems hardly fair to blame the evening school for failing, when labouring under so heavy a handicap. No! Let us be fair. Some of the most successful engineers in this country have received the whole of the technical training they ever had at an evening school.

Those who have not made a study of education, and have accepted the statement so often made in the daily Press, that we are miles behind Germany in educational methods, will be surprised to learn for the first time from Messrs. Fleming and Pearce's book that the system of elementary industrial education in Scotland is practically the same as in Germany, and it must be admitted is better than in England. The local education authorities in Scotland, as the authors point out, are compelled to provide suitable continuation schools having reference to the crafts and industries practised in the locality, and have powers to compel attendance; and employers may be compelled by the local education authority to provide facilities for attendance at such schools, and to reckon it as part of an operative's working hours. The above-named powers have been put into force in about 20 localities in Scotland, and are only suspended in others on account of the war. The habit of education in Scotland is so strong that in Edinburgh, although compulsory attendance at continuation schools is not in force, no less than 70 per cent. of the children of school age attend such schools.

From recent statistics it will be seen that throughout Scotland about 20 per cent. of the scholars in elementary schools pass into the continuation schools, whilst in England the number is under 2 per cent. The effect of the higher standard of education in Scotland is no doubt responsible for the high percentage of Scotsmen in responsible positions in English engineering shops, and in the mercantile marine engine rooms. How seldom is an English engineer found in a position of responsibility in Scotland! It is, however, gratifying to learn from the daily Press that Mr. H. A. L. Fisher (Minister of Education) intends shortly to lay before the House of Commons an important scheme of educational reform, embodying the main features of the Scotch system, and the abolition of the half-time system.

But the reviewer finds he is writing an article instead of reviewing the book which he has held up so long. The fact is, it is so interesting and provocative of discussion that it is difficult to keep on the track.

The economic aspect of education, and the relation of education to industry are very broadly and fairly discussed, and the arguments for and against vocational training are fully gone into. Methods of industrial training in England, France, Germany, Switzerland, and the U.S.A. are described in general terms, and specific examples of modern works schools are described in considerable detail, including the schools of the British Westinghouse Co. and Siemens and Halske; and the systems of apprenticeship in vogue at the works of Ludwig Loewe, Siemens & Halske, and the M.A.N. Works are set forth in addition to examples in leading British works. One would have liked to see some reference to the system of engineering training in the British Admiralty, a system which produces first-rate men, and to the collaboration between manufacturers, scientific institutions, and educational establishments, such, for instance, as is in vogue on the North-East Coast. The reviewer throws out the suggestion for the next edition. Sufficient has perhaps been said to indicate that the book is a valuable and timely contribution to the subject of industrial education and engineering apprenticeship training, and deserves the careful study of manufacturers and educationalists—(in parentheses, we don't like the authors' word "educationist").—F.B.

WAR ITEMS.

A Reader's Appreciation.—A Lance-Corporal with the London Electrical Engineers writes, under date July 7th:—

"It occasions me great pleasure to express my thanks for the kindness and promptitude with which you have forwarded the *Electrical Review* during the last 12 months. If it had not been for the matter contained in its pages, and also for its high industrial influence, it is quite probable that I, and many others here, who are almost banned in the whirl of military life, would have lost all touch with the outside electrical world, and might have fallen into such a chaos of disintegration that it would have needed enormous powers of concentration to reawaken our interest. I pass the *Electrical Review* freely amongst my fellows, whose appreciation of its value and merits ranks high, and makes their fingers itch to grasp the good old switches of former days, and to grapple with those problems so necessary to the fulfil-

ment of their art. On behalf of my fellow-men and myself I wish to state that our gratitude and appreciation are sincere, combined as they are with the wish for your future advancement and success."

A Union's Welcome to Disabled Men.—There was a strong protest at Rochdale Town Council against the action of the Electrical Trades' Union in declining to allow their members who are employed at the electricity station to give instruction in switchboard duties to disabled soldiers and sailors. A letter was read from the Union in which it was stated that they were trying to come to some agreement as to wages to be paid, also that no man should be discharged to allow a disabled soldier or sailor to take his place. If an amicable agreement could be come to on these points the Union would issue fresh instructions to its members.—Ald. H. Clark said the letter was one of the most narrow-minded and unpatriotic they had received for a long time. If that was an example of how workers desired to treat one another he hoped employers would show them a better.—Ald. Howarth said the Union did not seem to be helping the Government.—Coun. Shawcross said the placing of disabled men should be a subject of arrangement; it was a quite proper attitude for the Union to take, as they must not say that wounded soldiers were to be placed willy-nilly in a trade, thereby putting regular men out.

Exports from Sweden.—The Swedish Government has prohibited the exportation of accumulators, cells, and batteries, wholly or partly mounted, also electrodes cemented together.

Contraband.—In the "London Gazette" for July 3rd there appears a list of articles to be treated as absolute and conditional contraband.

Copenhagen Difficulties.—As a result of the difficulty in getting the materials for rails, telegraphs, and signals, it is impossible to complete the new underground railway at Copenhagen.—*Times*.

New Industries Established During the War.—Since the outbreak of war many new industries have been established in the United Kingdom, and goods which formerly had to be obtained from abroad are now being manufactured at home. The Department of Commercial Intelligence of the Board of Trade desires to make its record of such new industries as complete as possible, in order to satisfy inquiries for new sources of supplies, which are frequently received. Manufacturers are therefore invited to inform the Department of new industries, or new developments of existing industries, established in this country.—*Board of Trade Journal*.

Exemption Applications.—At Southwark, the Military Representative drew attention to the new list of reserved occupations, pointing out that men previously granted exemption as being in charge of the repair and maintenance of machinery, previously in the list, were now withdrawn from it. The new list only included men exclusively engaged on the repair and upkeep of machinery in munitions works or factories engaged on Government contracts. Ald. Boyd remarked that many Tribunals took no notice whatever of the certified list of occupations.

On the appeal of the manager of the U.D.C. tramways, Ilford Tribunal has given conditional exemption to C. R. Day, ticket inspector.

On a review, the Folkestone Tribunal has confirmed conditional exemption held by E. Marchant (40), clerk at the works of the Electric Light Co.

Oldham Tribunal has granted exemption until October 1st, on business grounds, to an electrical engineer and contractor (29, B 1), and until November 1st to another electrical engineer and contractor (30, Class A), whose partner is in the Navy.

At Douglas (Isle of Man), an appeal was made by L. Dyer (C 2), electrical engineer, engaged, amongst other places, at the Manx brush factory. His work was deemed to be of national importance, and he was conditionally exempted.

Before the Cheshire Appeal Court, the Chester Corporation appealed against final exemption allowed locally to the tramway traffic inspector (30, Class A), and a coach painter in the tramway department (40, Class A), and the Military appealed against three months' exemption allowed to a coach-builder (41, B 1), in the same department. Ald. John Jones, chairman of the Tramways Committee, said they had released every available man. The Tribunal allowed until September 1st to the traffic inspector, dismissed the appeal for the painter, and also that of the Military against the coachbuilder.

At Doncaster, a Military review was made of exemption allowed to a Corporation tramways inspector (29, Class A 2). The chairman of the Tramways Committee said that they could not get proper discipline without capable men as inspectors, and they had got to the lowest limit of men if the service was to remain efficient and the routes were to be kept open. Exemption to September 30th was given, and the Military Representative gave notice of appeal.

At Aldershot, exemption was claimed for F. H. Brown (35), electrician at the Hippodrome, passed in Class B 1 after three rejections. It was stated that it was impossible to get a competent substitute. A final month was granted.

At Carlisle, Messrs. Morton defended a Military appeal against conditional exemption held by A. Munro, electrician, urged by the firm to be indispensable. The appeal was allowed, and the exemption cancelled.

At Canterbury, Mr. C. A. Blaschek, city electrical engineer, applied for exemption for G. E. Locke (38), a coal trimmer, given conditional exemption in 1916. The Clerk stated that the man was discharged from the Navy, but he had been called up again and passed in C1. Mr. Blaschek said that he thought the man was doing work of national importance, and he was exempted until a substitute is found.

Malmesbury Rural Tribunal has given exemption until October 1st to C. A. Harvey (32, Class C3), electrician to the Trustees of the Earl of Suffolk's Estate at Charlton.

On a review, the Maidenhead Tribunal has allowed conditional exemption to remain in the case of G. Lovegrove, electrical engineer. On the recommendation of the Advisory Committee, Rochdale Tribunal has given exemption until September 30th to B. R. Eves (36), tram conductor and motorman, and E. Hornby, motorman, engaged on the Corporation tramways.

LEGAL.

CONTROLLED FIRM SUMMONED BY MANCHESTER CORPORATION.

MESSRS. CONNOLLY BROS., LTD., cable manufacturers, Mill Brow, Blackley (a controlled firm), were summoned at Manchester Police Court, last week-end, for burning trade refuse within 100 yards of a dwelling house, thereby causing a nuisance to householders in the vicinity. The summons was taken out under an Act passed in the eighth year of Queen Victoria's reign, entitled "An Act for the Good Government and Police Regulation of Manchester."

MR. DALE, deputy superintendent of the Corporation's Sanitary Department, said defendants were warned about the nuisance by one of the departmental inspectors on May 23rd, but they repeated the offence on June 12th.

MR. WM. CONNOLLY, the works manager, said the rule was for all shop refuse to be burnt in a destructor, but on each of these occasions it was burnt in a field adjacent to the works, without the knowledge or consent of the firm. He denied that they were burning the insulation off in order to recover the wire, and said the smell was caused by the incineration of used cotton waste.

A fine of 10s. was imposed.

WEST HAM CORPORATION v. BARNETT & WOOD.

IN the Bow County Court, last week, before his Honour Judge Graham, K.C., the West Ham Corporation were the plaintiffs in an action against Ernest Richard Barnett and Wm. Stanley Wood, formerly trading as Messrs. Barnett & Wood, of Albert Works, Chatsworth Road, Stratford, electricians, to recover £18 9s. 2d.

MR. KYFFIN, barrister, appeared for the plaintiffs, and Mr. Vaughan for Mr. Barnett.

COUNSEL said the claim was for electricity supplied and the hire of motors. There was no dispute as to the hiring or the amount, but there was a question as to the form of the judgment. The contracts were signed by Barnett on behalf of the partners, and he asked for judgment in the usual form.

MR. VAUGHAN: If that is done, it involves one being liable for the whole debt, and they dissolved partnership in January. I say that cannot be; it is not fair. If the contract were looked at, it would be seen that "we agree with them to pay for electrical energy." That was a joint agreement, and not a joint and several agreement, which was an entirely different matter. His client was only liable for one half, and the judgment should be in the form of one half each.

JUDGE GRAHAM: If it would do the smallest good to separate the judgments I would do so, but it would not. Judgment for the plaintiffs for the amount claimed against the defendants.

MR. VAUGHAN: Then we shall have to get an indemnity against Wood.

MR. KYFFIN: He says he will pay half.

BLOCH v. STAR MOTOR AND CYCLE CO.

IN the Bow County Court, on Tuesday, before his Honour Judge Graham, K.C., Messrs. H. & S. Bloch, of 31, Great Colmore Street, Birmingham, wholesale small hardware merchants, sued the Star Motor and Cycle Co., of 34, Barking Road, Canning Town, to recover £51 11s. 5d. for electric torch cases supplied. Mr. Emery was counsel for the plaintiffs. It appeared that the plaintiffs' sister called on the defendants, and obtained an order for these electric torch cases, which were supplied. They were distinctly told that the batteries could not be supplied. When payment was pressed for, however, they said they could do nothing with them unless they had the batteries. The cases had not been returned, and no payment had been made. The defendants did not appear, and judgment was entered for the plaintiffs, with costs. An immediate order was asked for and obtained, as counsel said he believed an affidavit sworn by the defendants was to delay, to enable them to make away with assets.

BUSINESS NOTES.

Book Notices.—"Journal of the Institution of Electrical Engineers." Vol. LV. No. 267. June, 1917. This issue contains the following papers:—"High-tension Overhead Transmission Lines," by G. V. Twiss; and "Electric Wave Phenomena in the Dynamo-electric Machine," by F. Creedy.

"Steam Turbines." By J. A. Moyer. London: Chapman & Hall. Price 16s. 6d. net.

"The Journal of the Junior Institution of Engineers" for July contains a paper on "The Electric Lighting of Trains," by G. M. Langley, which gives a comprehensive account of most of the successful systems in use.

"Industrial Research in the United States." By A. P. M. Fleming, M.I.E.E. London: H.M. Stationery Office. Price 1s. net, 1s. 3d. post free.—This is the first of a series of papers which the Advisory Council for Scientific and Industrial Research intends to issue. Its purpose is twofold: Primarily, to record the author's observations during his recent visit to the United States; secondly, to afford material for the consideration of the position of the United Kingdom in respect of research. Amongst the companies which undertake research on an extensive scale are many whose products are well known in this country. For example, the Eastman Kodak Co. spends on research about £30,000, or 0.7 per cent. of the company's profits, per annum; the General Electric Co. from £80,000 to £100,000 per annum. The most striking features of the research work undertaken by such firms are (1) the installation in many cases of full-scale manufacturing facilities, which enable processes to be perfected without hampering the works; (2) the provision of manufacturing facilities in the laboratory in order to develop such products as result from new discoveries to the point at which the scale of manufacture calls for transfer to one of the works departments, or to a new or separate organisation; (3) the growing tendency to devote more and more of the resources of the laboratories to pure science investigations, with a view to making discoveries. Other noteworthy facts are the freedom with which results in pure science are published: the growing appreciation in the factory of the commercial value of scientific men; and the recognition of the value of research laboratories as a means of inspiring confidence in the minds of customers. There are a number of Associations of Manufacturers which undertake research work for the common benefit of their members. The research work of the universities and colleges presents many interesting features, and the national institutions which deal with industrial research are lavishly financed, either by the State or by private benefaction. The commercial research laboratories are on an extensive scale, and are well equipped. The war has disclosed in British industry an enormous latent capacity for adaptability to entirely new lines of manufacture, many of which have depended for their development upon scientific research. The research facilities are, as yet, disproportionate to the need, and there is an urgent call for the establishment of an organisation which shall maintain the creative impulse given by the war. In the light of his study of American developments, Mr. Fleming suggests that the most important alternative schemes for the United Kingdom are:—(a) Research laboratories in industrial works; (b) research laboratories for a group of works in the same industry; (c) the centralisation of research in the universities or colleges; (d) an Imperial centralised laboratory for the whole industry. Mr. Fleming adds that, in considering these policies, it is imperative to bear in mind that industry is the basis of national prosperity, and that every resource should be used to facilitate its progress.

"Proceedings of the American Institute of Electrical Engineers." Vol. XXXVI, No. 6. June, 1917. New York, U.S.A.: From the Institute. Price \$1.—This issue contains a report of the presentation of the Edison Medal to Mr. Nikola Tesla for his "early original work in polyphase and high-frequency electric currents." It is also unique in that a paper on the "Illumination of the Panama-Pacific International Exposition," by Mr. W. D'A. Ryan, is illustrated with 29 plates printed in colours, in addition to other figures, in order to show the wonderful effects produced by what was probably the most elaborate scheme of lighting ever brought into existence. The reproductions, which suggest photography in colours, are excellent, and form a striking innovation in a technical publication. The details of the apparatus specially designed for the scheme, and of the results aimed at and attained, are fully described in the paper.

"Circular of the Bureau of Standards," No. 33: "U.S. Government Specification for Portland Cement." Washington: Government Printing Office.

"Records of Railway Interests in the War." Part IV. From August, 1916, to April, 1917. Illustrated. London: *The Railway News*. Price 1s.

Plant for Sale.—Winchester Corporation Electricity Committee is inviting offers for a Bellis six-cylinder tandem-compound engine, direct coupled to a Parker bipolar shunt-wound generator. Full particulars are given in our advertising pages to-day.

Trade Announcements.—The removal of the Birmingham depot of MESSRS. VERITYS, LTD., has had to be deferred for a time owing to the War Office having taken over part of the new building. Their address is still, therefore, 28, High Street.

MESSRS. BROWN, BOVERI & CO., LTD., have acquired temporary offices at 9, Old Queen Street, Westminster, S.W. 1, as from July 14th, their Caxton House offices having been taken over by the Army Council. Telephone number: Victoria 2538.

Catalogues and Lists.—THE POWER PLANT CO., LTD., West Drayton, Middlesex.—Folder showing their steam turbine gears, double helical mill gears, and double reduction gears.

MESSRS. RHODES, HODGSON & CO., LTD., 118, Tumbling Hill Street, Bradford.—Circular giving particulars of their system of supplying and cleaning sponge cloths for machinery users.

THE ELECTRICAL APPARATUS CO., LTD., Vauxhall Works, South Lambeth Road, S.W. 8.—The July number of the "E.A.C." Quarterly Review contains particulars of a new form of motor-control panel and a high-tension switch pillar of the draw-out pattern.

THE GENERAL ELECTRIC CO., LTD., London, E.C., have issued an advertising novelty concerning "Freezor" fans. It takes the form of a glass showcard struttled for counter and window use, with an attractive prismatic design of the fan. It is calculated to arrest attention of passers-by. The showcards are only supplied to genuine dealers in these fans.

Dissolutions and Liquidations.—PRENTICE WIRELESS TRAIN CONTROL, LTD.—This company is winding up voluntarily, with Mr. F. V. Royce, 5, Broad Street Place, E.C., as liquidator. Meeting of creditors, July 16th.

BRITISH ADDING MACHINE CO., LTD.—This company is winding up voluntarily, with Mr. R. L. Sare, 2, Great Winchester Street, E.C., as liquidator. Meeting of creditors, July 17th.

MARKET HARBOROUGH AND DISTRICT MOTOR TRACTION CO., LTD.—First and final dividend 9s. 10d. in the £, payable by Official Receiver, 1, Berridge Street, Leicester.

UNIVERSAL TELEPHONE AND ELECTRICAL CO., LTD.—This company is winding up voluntarily, with Mr. J. E. Percival, 6, Old Jewry, E.C., as liquidator. Meeting of creditors July 23rd, at 6, Old Jewry, E.C. Particulars of debts, &c., to be sent to the liquidator by October 1st.

BREAR & AYNLEY, electrical engineers, 458, Huddersfield Road, and Albion Electrical Works, Ravensthorpe, Dewsbury.—Messrs. H. Brear & D. Aynley have dissolved partnership as from February 28th, 1916. Mr. Brear attends to debts, &c., and is carrying on the business in his own name at Calder Wharf Mills, Aire Street, Ravensthorpe.

CHARLES L. CUTHBE & CO., india-rubber, asbestos and vulcanite merchants, &c., 37, Great Eastern Street, London, E.C.—Messrs. C. L. Cuthbe and E. D. Burley have dissolved partnership as from October 1st, 1916. Mr. Cuthbe attends to debts.

BOSCH MAGNETO CO., LTD.—Creditors must send particulars of debts or claims to the Controller, Mr. A. E. Woodington, 5, Philpot Lane, E.C., by August 13th.

MORRIS & LISTER (LONDON), LTD.—Particulars of debts, &c., to Mr. H. S. Sugden, 36, King Street, E.C. 2, by August 1st.

ROSE AUTOMATIC TARGET CO., LTD.—Meeting of creditors on August 10th, at 14 and 15, Coleman Street, E.C., to hear an account of the winding up from the liquidator, Mr. W. Cantor.

Bankruptcy Proceedings.—C. B. OGILVIE, Whalley Range, Manchester, electrical engineer.—July 18th is the last day for receipt of proofs for dividend. Trustee, J. G. Gibson, Byrom Street, Manchester.

LIGHTING AND POWER NOTES.

Aberdeen.—The Electricity Committee has approved of an agreement to supply a local firm with a minimum of 250,000 units per annum for five years.

Birkenhead.—YEAR'S WORKING.—The accounts of the Corporation electricity undertaking to March 31st last show a total income of £52,240, an increase of £4,025; expenditure amounting to £33,415, and a gross profit of £18,825; after deducting interest and sinking-fund charges, amounting to £14,977, and income-tax £1,059, there remained a balance of £2,790. Special items, amounting to £919, have been charged against revenue during the year, the net balance carried to renewals fund being £1,871, and this fund now stands at £14,065.

Bradford.—YEAR'S WORKING.—The statement of accounts of the electricity undertaking for the financial year ended March 31st last, shows a net profit of £11,812, as compared with £15,988 in the previous year. The income from the sale of energy amounted to £188,500, as compared with £156,800 in 1916. The output of electricity was more than 46,000,000 units, as against 34,000,000 units in the previous year. The costs of generation were £75,600, an increase of £26,300, but the cost of distribution decreased by £260. Generation and distribution costs combined averaged 13½d. per unit, as against 10½d. in the preceding year. Allowances to dependents of men on military service absorbed £22,841, an increase of £673. Charges for interest and sinking fund amounted to £74,300 per annum. Practically half of the total capital expenditure of £1,100,000 had been paid off, and £36,000 now stood to the credit of the reserve and renewals account. The Committee, in view of the increased cost of working, expressed satisfaction with the result of the year.

The Electricity Committee has received an intimation from the B. of T. that the Electrical Distribution of Yorkshire, Ltd., has decided not to proceed further during the present session of Parliament with its application for a prov. order relative to Clayton and Queensbury.

Burnley.—YEAR'S WORKING.—The report of Mr. Starkie, the borough electrical engineer, for the year 1916-17, shows a total revenue amounting to £34,340, working expenses £17,006, and a gross profit of £17,334, as against £16,380 in the previous year. After meeting interest and loan charges, the net surplus was £3,464, as against £4,472. Charges were increased during the year, and brought in £1,150 additional revenue, more than compensating for the added costs, but extra loan charges more than absorbed any gain under this head. The units sold totalled 5,222,626, a small increase on the previous year, due to improved power and heating business. The maximum load was 2,167 kw., and load factor 27.5 per cent.; the station plant capacity was 5,570 kw. The motor load amounted to 2,064 h.p. in 421 motors, and it is noted that it has become necessary to run the plant for the whole of the 24 hours in order to cope with the night load, hitherto carried by the batteries.

Bury.—YEAR'S WORKING.—The report of Mr. S. J. Watson, the chief engineer, on the electricity undertaking for the year ended March 31st last, shows that 13,971,547 units were sold, or, roughly, 470,000 more than in 1915-16. Of these, 95 per cent. were supplied from the Chamber Hall power station. Some 8,700,000 units were sold for power and heat and 3,000,000 units for bulk supply; the load factor for the combined general and traction supply was 31.7 per cent. A total of 1,029 motors of 8,638 h.p. are connected to the mains. The generation and distribution costs amounted to, roughly, ½d. per unit, and the total cost, including interest and loan charges, to ¾d., while the average revenue per unit was 8d. Both average revenue and costs have risen slightly during the past three years. The output has been maintained on an average of 2.95 lb. of coal per unit, as against 3.06 lb. in the previous year, despite the necessity of using the less economical Rochdale Road plant to a considerable extent, involving the consumption of over 1,000 extra tons of coal as compared with the Chamber Hall plant. The total revenue amounted to £46,596, while the all-in costs were £43,928, leaving a net balance of £2,668, as against £2,003 in the previous year; £1,000 was allocated to rate relief and the balance to reserve.

Continental.—GERMANY.—Under the auspices of the German Continental Gas Co., of Dessau, and the Provincial Authorities of Saxony a new company is being formed, with a capital of £250,000, with the object of operating the new State electricity generating station near Wittenburg. The plant, which is about to be further extended, has already an annual output of about 100 million kw.-hours.

Dartford.—PRICE INCREASE.—In order to meet the extra cost of production, the U.D.C. has increased the price of energy for lighting by 30 per cent. instead of 20 per cent., and for power by 35 per cent. instead of 20.

Donaghadee (Co. Down).—The B. of T. has decided to defer the revocation of the Donaghadee Electric Lighting Order for a period of 12 months as from August 18th next.

Grays.—PRICE INCREASE.—The U.D.C. has decided to advance the price of energy to all consumers, as from July 1st, by 8½ per cent., making a total increase since the war began of 33½ per cent., and to add to new consumers' agreements the minimum charge of 6s. 6d. per quarter.

Heckmondwike.—PRICE INCREASE.—The U.D.C. has adopted the recommendation of a special meeting that the charge for electricity be increased by 33½ per cent., making it 6d. per unit for lighting, and from 2d. to 4d. for power, according to units consumed per h.p., and that the discounts be reduced from 5 to 2½ per cent.

Knottingley.—The B. of T. has extended the period under the E.L. Order by a year.

London.—BERMONDSEY.—YEAR'S WORKING.—The accounts of the B.C.'s electricity undertaking for the past year show a deficit of £7,024. The total income was £12,178. Part of the deficit was due to special charges; the new chain-grate stokers, costing £912, had increased the capacity of the boilers, whilst bulk supply apparatus costing £434, and a boiler feed pump, £297, had been installed out of revenue. War service pay, £337, and war bonus, £249, were other special charges. The units generated, including 189,020 from the bulk supply, were 7,581,914, and of these 256,441 were sold for public lighting and 6,232,255 to private consumers. The total maximum supply demanded was 2,740 kw. The units sold fell short by 207,800 of the quantity estimated, but were 210,000 more than in the previous year.

The Electricity and Street Lighting Committee recommended that the charges for power be further increased by 20 per cent. on the pre-war rate, making 50 per cent. in all, and for lighting a further 10 per cent. on the pre-war rate, making 40 per cent. in all. The Council sanctioned the increased prices, but referred the accounts back for further details.

The Finance Committee reported that with regard to £340 estimated for war service pay during the next year, it was of opinion that this should be a charge on the general rate, as well as the sums under the same heading for the last three years, making a total of £1,133 ss. 10d., and recommended accordingly. The Council adopted the proposal.

ISLINGTON.—In accordance with instructions given to dispense as far as possible with public lighting during the summer months, wherever possible the electric lamps on one side of the road have been extinguished and certain others put into lighting at a distance of about 100 yards apart. The total number of electric lamps in

lighting (exclusive of converted gas lamps, *i.e.*, lanterns on arc-lamp columns) is 412, of which 229 are lighted by arc lamps, the remaining 183 having been converted to one-watt lamps of either large or small candle power. The number of electric lamps put out of lighting in consequence of the reduced lighting is 110.

HACKNEY.—The B.C. has received the Arbitrator's award with regard to the salaries and wages of the staff and employees of the electricity undertaking. The award, which dates back to the first pay day in April, 1917, will increase salaries and wages by a total of £3,526 per year, made up as follows:—Officers, £770; works and running staff, £1,842; sales department, £255; destructor staff, £659.

Nottingham.—The Corporation is proposing to apply for a prov. order for electricity supply in the Kirkby urban district, amongst other places.

Oldham.—**YEAR'S WORKING.**—The report of the joint engineers on the working of the Corporation electricity undertaking during the last year shows a total revenue of £73,555, working expenses amounting to £11,714, and a gross profit of £31,840, as against £26,698 in the previous year. Deducting interest and sinking-fund charges, the net surplus was £9,032, as against £5,107 in the previous year. The units sold were 14½ millions, against 10½ millions (roughly) in 1915-16, the power units having increased from 5,385,000 to 9,338,000 in the 12 months. The additional 4 million units sold only increased the fuel bill by about £1,700, and the works distribution and management costs fell from '852d. in 1915-16 to '69d. per unit in 1916-17. No doubt this result was due in part to the new turbine and boiler plant brought into use, by which the generating plant capacity was increased from 10,140 kW. to 13,140 kW. The maximum load was 6,810 kW., and load factor 21·31 per cent., as against 22·27 per cent. in the previous year. The report contains a series of coloured diagrams which illustrate the progress of the last few years, and it is worth noting that the marked increase in power units sold nearly coincides with the marked economy in coal consumption, which now amounts to about 3½ lb. per unit sold, as against nearly 8 lb. in 1913.

Rotherham.—**LARGE TURBINE PLANT.**—At the meeting of the B.C., last week, the purchase was authorised of a new 25,000-Kw. set at the electricity works, with accessories and boilers, at an estimated cost of £275,000. This brings the total estimate for extensions, within the past year, to £675,000, an expenditure of £400,000 being authorised in March.

Sheffield.—**ADDITIONAL PLANT.**—The Government Department concerned has agreed to allocate 28,000 kW. of generating plant, boilers, &c., to the Corporation, to enable it to meet increasing demands.

Notice is being given to the Rural District Councils of Wortley, Rotherham, Kiveton Park, Norton, Chesterfield, and Clowne, and the Urban Districts of Stocksbridge, Dronfield, and Handsworth, of the intention of the Corporation to apply for a prov. order to supply electricity in their districts or parts of their districts.

St. Annes.—For the first time in its history, there is a deficit of £85 on the electricity undertaking for the year ended March 31st, attributable to the increased cost of labour and coal, and to the reduction of income due to the Summer Time Act.

Stowmarket.—The Electricity Supply Co. has notified the Council that unless certain difficulties are overcome, all its efforts will be concentrated on the Felixstowe undertaking, and the Stowmarket supply will be discontinued. The trouble is apparently due to the withdrawal of men by the military authorities, and it was suggested that the Council should ask the L.G.B. and Ministry of Munitions to take the matter up with the military authorities. It was agreed to discuss the matter in Committee.

Stretford.—The Electricity Committee has approved the continuation of the terms of the agreement until December 31st next with reference to the supply of electricity to the Stretford Gas Co., subject to an increased charge of 15 per cent., and that the clause providing for a minimum consumption shall not apply for the present year.

Swansea.—In his report on the electrical undertaking, the borough electrical engineer recommends that the installation of electric light in the Corporation dwellings at Trewddfa shall be proceeded with. It was stated in discussion that the charge to tenants would be 8d. per week all the year round.

ELECTRO-CULTURE.—A report has been submitted to the Electricity Committee on the advantages of electro-culture in promoting plant growth, and a Committee is to be formed to visit Hereford and study the work carried out there.

Thornton.—The B. of T. has extended the period under the E.L. Order by a year.

Walsall.—The net deficiency on the electricity supply department for the year ending March 31st last is £8,987, as compared with a deficiency of £899 for the previous 12 months. The change-over from 3,300 volts to 6,600 volts on the E.H.T. feeder to Bloxwich has recently been effected.

Councillor Haward, in discussing the balance-sheet, said it had been made very plain on several occasions that a loss was certain to be made during the transition stage from the old works to the new works. They had, however, sustained a loss which was unexpected, due to the commandeering of plant which was intended for the new power station. The consequence was that, instead of the new works being brought into operation early in 1915, it was not

until February 10th this year that any plant was available for use. He considered that they had a strong claim against the Ministry of Munitions for compensation.

The Mayor mentioned that a substantial claim for compensation had already been lodged with the Ministry of Munitions.

Walthamstow.—**LOAN SANCTION.**—The Treasury has agreed to a loan of £16,387 for the purpose of extending the station, at 5½ per cent. interest, repayable both as to principal and interest, in equal half-yearly payments in 15 years. The electrical engineer has been instructed to make arrangements for the erection of an electrical siren on the Town Hall, to give warning of air raids.

Winchester.—**YEAR'S WORKING.**—The report on the working of the electricity department for the year ended March 31st last, shows a total revenue amounting to £11,131, working expenses £8,834, and a gross profit of £2,601, as against £5,826 in 1915-16; after providing for interest and loan charges, &c., the surplus was £132, as against £575 in the previous year. The figures do not vary greatly from those of 1915-16, increased charges having made up for the falling-off due to restricted supply. The output sold amounted to 910,131 units, against 988,366 in 1915-16, of which power accounted for 328,296 and heating for 165,422 units, some 662 kW. of heating and cooking apparatus being included in total connections amounting to 2,712 kW. Heating and cooking units increased by 18 per cent. on the previous year, while in all other sections the sales decreased. The maximum load was 590 kW. and the generating plant capacity 750 kW.; 6·10 lb. of coal, costing '724d., was used per unit sold.

TRAMWAY and RAILWAY NOTES.

Burnley.—**YEAR'S WORKING.**—The annual report of Mr. Mozley, the general manager, on the working of the Corporation tramways, shows that over 17,000,000 passengers were carried and 1,549,000 car-miles worked. The gross income was £87,421; working expenses amounted to £58,601, and, after providing for war allowances, the balance was £25,606, being a few hundreds better than in the previous year. After meeting interest and loan charges, rents of lines, and income-tax, there was a balance of £5,222, which was placed to reserve; the previous year's balance was £6,010. The working expenses increased by £5,032, due to increased wages, cost of materials, and more repairs carried out, and Mr. Mozley includes a striking list of over 40 articles, of which the cost has increased in a number of cases over 100 per cent., while one case of 394 per cent. increase is reported. Tires show 235 per cent., axles 258 per cent., and steel 143 per cent. increase. Mr. Mozley estimates that £5,600—£6,000 per annum should be provided towards depreciation, and he does not regard the net financial result as satisfactory, although, as some £13,000 has been paid in war allowances and increased income-tax in the last three years, he concludes that but for the war the position would have been a satisfactory one.

Heywood.—There has been a loss on the tramway undertaking for the past year of £783.

Irish Electric Tramway Workers' Wages.—At a meeting of the Union of the men employed by the Dublin United (Electric) Tramways Co., it was announced that the directors had granted a further increase of 2s. 6d. per week, making a total of 3s. 6d. during the past 10 months. Cork Electric Tramway and Lighting Co.'s employees have accepted the company's offer of an increase of 2s. 3d. per week, with half an hour's less work per day and one day off in 12, to motormen and conductors, and 1s. 6d. to other branches.

Leeds.—**FEMALE INSPECTORS.**—The Corporation is considering the appointment of women as tramway and ticket inspectors, at a wage of 30s. per week, with the addition of war bonus, rising, subject to satisfactory service, to 32s. 6d. after six months, and to 35s. after 12 months' service.

Manchester.—After a further week of obstructive tactics the employees on the Corporation tramways threatened a strike last week, and Mr. McElroy, the general manager, went to London to lay the position before the Minister of Labour. As anticipated, the Government stepped in, and pointed out that a strike would be illegal. Sir David Shackleton also informed the men's that if work was continued he would arrange for arbitration within seven days and a decision within a fortnight. A ballot of the employees showed a majority of 280 in favour of a strike, but it was considered too small to warrant such a step, and normal conditions have been resumed, much to the general satisfaction.

Newcastle-on-Tyne.—The Tramways Committee has agreed to a scheme for utilising the sand cars during the winter for distributing coal in the city.

South Africa.—The application of electric traction to certain sections of the S.A. railways has been raised on several occasions in recent years. Mr. John Roberts, the borough electrical engineer of Durban, considers that a great field lies before electricity on the Natal main line, and he looks forward to a time at which large power plants will be established in various parts of South Africa from which the railways will draw their supply. According to this authority, the Durban-Johannesburg line must

inevitably be electrified in the near future, and the supply of current will, of course, be a most essential part of the scheme. The Natal line to Johannesburg is 480 miles in length. Assuming current available at Johannesburg and Durban, a third supply about midway would fall, by a fortunate chance, right in the principal Natal coalfield. To ensure continuity in case of breakdown, two more stations would be required, one midway between Johannesburg and Newcastle and the other between Newcastle and Durban. —*British S.A. Export Gazette.*

Walsall.—**YEAR'S WORKING.**—During the year ended March 31st last, the Corporation tramways carried 10,395,050 passengers and operated over 900,000 car-miles. The revenue amounted to £52,373 (roughly 1s. 2d. per car-mile); working expenses were £30,004 (7½d. per car-mile, including 2d. for electricity); and after meeting interest and loan charges, there was a net balance of £11,170. Of this, £5,000 went in rate relief and £3,146 to special reserve, &c. The buses operated in connection with this undertaking earned 14d. per mile; the operating expenses were 10½d. per mile (including 3½d. per mile for petrol); and after meeting financial charges, a balance of 2½d. per bus mile (£3,146) was carried to the appropriation account.

TELEGRAPH and TELEPHONE NOTES.

Russia.—Owing to the opening of the Russian offensive the All-Russian Radio-Telegraphic Congress has been postponed.

Telephonic Reception of Cable Messages.—It appears that the telephone receiver may take the place of the Kelvin siphon recorder in the reception of cable messages at no distant date. Recently a number of experiments were carried out under the direction of Lieut.-Colonel G. O. Squier, in which the receiving apparatus made use of the "ticker" principle and the audion, both of which figure prominently in the wireless apparatus of to-day. The cable used for the test was 1,086 miles long, and the actual receiver was an ordinary telephone. The feeble current received was broken up by means of the sliding contact "ticker" and rendered audible, and in order to secure greater sensibility, a tuned audion amplifier was used in connection with the "ticker." It is reported that the sensitiveness of the apparatus is so great that less than one-twentieth of the voltage necessary for operating the siphon recorder is sufficient to give good traffic signals. —*Telephone Engineer.*

CONTRACTS OPEN and CLOSED.

OPEN.

Aldershot.—July 17th. E.L. installation at Cargate House, for the U.D.C. Mr. F. Garside, Electrical Engineer.

Australia.—**SYDNEY.**—August 22nd. N.S.W. Government Railways and Tramways. Thirty-six induction motors (Specification No. 488). September 19th.—One 225-H.P. synchronous motor (Specification No. 489). Particulars from Electrical Engineer's Office, 61, Hunter Street, Sydney.

Dublin.—July 16th. Electricity Supply Committee. Transformers for one year. See "Official Notices" July 6th.

Glasgow.—Electricity Department. Boiler-house plant, E.H.T. switchgear (20,000 volts). See "Official Notices" June 15th.

Hull.—July 19th. T.C. Machinery oils for the electricity works and sub-stations. Mr. J. F. Magoris, Acting Electrical Engineer.

Keighley.—August 3rd. 12,000 tons best slack and small slack coal for Electricity Department. Six-monthly and twelve-monthly period. Mr. H. Webber, Boro' Electrical Engineer.

London.—**ISLINGTON.**—July 19th. B. of G. Supply and fitting of complete X-ray apparatus. See "Official Notices" to-day.

Spain.—The municipal authorities of Fuentesancho (Province of Zamora) have recently invited tenders for the concession for the electric lighting of the town during a period of 20 years.

West Ham.—July 17th. Corporation. Two motor ambulance vehicles. See "Official Notices" July 6th.

CLOSED.

Aldershot.—U.D.C. Setting up electrically-equipped chain-cutting machinery: Burch & Vertue, £12.

Bridlington.—T.C. 1,000 tons of Bullcroft Main washed small coal for the electricity works: W. P. Wilson, York, 13s. 9d. per ton.

Buxton.—T.C. 2,000 tons of Pilsley hard slack coal for the electricity works: Day & Ferguson.

Dartford.—U.D.C. 2,000 tons of Aberclwyd rough small coal free on rail at Dartford for the electricity works, at £1 4s. 6d. per ton.

Derby.—T.C. 100 illuminated route-number indicators for the tramways: General Seating Co., Ltd., £250.

Dewsbury.—Council. Electric vehicle (£911), Messrs. Mossay & Co.

Halifax.—Guardians. Mr. C. J. Casse, Bradford, at £29, electric wiring of Craigie Lea.

Hull.—Electricity Committee. Mr. Con. Greenwood, at £2,195, for cooling water tower foundations for the electricity works extension.

Sheffield.—City Council. Accepted tenders:—

T. W. Ward, Ltd.; M. C. Burnby & Son; George Turner; Loughbottom and Co.—32,000 tons of coal for 12 months, for Kelham Island power station.

Longbottom & Co.—208,000 tons of coal for Neepsend. Jonathan Longbottom & Sons—375 tons per month, from July, 1917, to June, 1918, of Bentley wash smalls, for Neepsend.

R. White & Sons.—Extension of contract for relaying the crane track on the coal-storage ground at Neepsend, £229. George Cooper.—Steel chimney.

Sunderland.—T.C. Electricity Committee. Redpath, Brown & Co., rolled-steel joists.

Wolverhampton.—Council. Accepted tender:—

Melville Dundas & Whitson.—Construction of new boiler-house wing, including overhead coal-bunkers, foundations and skeleton structure for the boilers, economisers, &c., £5,936.

FORTHCOMING EVENTS.

Birmingham and District Electric Club.—Saturday, July 14th. Visit, in conjunction with the Association of Mining Electrical Engineers, Warwickshire and Staffordshire Branch, to the Walsall Corporation generating station at Birchills. Paper will be read by Mr. H. A. Howie on "Recent Extensions to the Walsall Electricity Undertaking."

NOTES.

Useful Wrinkles.—In the course of certain experiments, Mr. Harry W. Brown, of Ballycarry, Co. Antrim, has discovered that upon charging a condenser from a 500-volt circuit, and then discharging it through the primary of a spark coil, he is able to get good sparking effects from the secondary terminals. The idea may not be new, but he has not yet seen it described in any text-books. He has also found an interesting method of making the calculation of the combined resistance of two circuits in parallel more amenable to the slide rule by using the following formula:—

$$R = \frac{R_1}{1 + R_1/R_2}$$

where R_1 and R_2 are the resistances of the two parallel circuits and R is their combined resistance. This also may not be new, but is certainly more convenient than the usual form.

Volunteer Notes.—**COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).**—Headquarters, Balderton Street, Oxford Street, W.

Orders for the week, by Lieut.-Colonel C. B. Clay, V.D., commanding:—**Monday, July 16th.**—Technical instruction for No. 3 Company, Right Half Company, at Regency Street. Drill, No. 3 Company, Left Half Company. Signalling Class. Recruits' Drill, 6.30.

Tuesday, July 17th.—Lecture, 6.30. Physical drill and bayonet fighting, 7.30.

Wednesday, July 18th.—Drill, No. 1 Company, Left Half Company.

Thursday, July 19th.—Drill, No. 2 Company, Left Half Company. Ambulance Class, 6.30. Signalling Class.

Friday, July 20th.—Technical instruction for No. 3 Company, Left Half Company, at Regency Street. Drill, No. 3 Company, Right Half Company. Recruits' Drill, 6.30.

Saturday, July 21st.—N.C.O.'s Parade, 2.0. Map Reading.

Sunday, July 22nd.—Parade will be at Esher for engineering instruction.

MACLEOD YEARSLEY, Adjutant.

Women's Work Exhibition.—An exhibition of official technical photographs and samples of women's work in the engineering and allied industries connected with munitions of war was opened on Monday last at the City Art Gallery by the Lord Mayor of Leeds. It will contain examples of the very latest developments in the employment of women in these industries; its object is to demonstrate the extent to which women have been and can be employed upon responsible work of all kinds. It will remain open until July 21st.

Standardisation in Electricity Supply in France.—In view of the large amounts of hydro-electric power now employed for war purposes, which will be set free on the return of peace, and the scarcity of coal, a Lyons correspondent of the *Revue Générale de l'Electricité* points out the importance of adopting uniform practice in the construction of new power stations, in order to facilitate their interconnection, and enable them to transmit power to distances of several hundred kilometres. Seven or eight generating stations situated on different rivers would thus be able jointly to supply some 200,000 H.P. at 150,000 volts in the region of Paris, thereby saving large quantities of coal.

Municipalities and Electricity Problems.—Reporting upon the Board of Trade Committee on Electricity Supply, the Council of the Association of Municipal Corporations makes the subjoined interesting observations on the Electric Lighting Acts and Orders, with suggestions for reform:—

The section of the Act of 1888, giving to the local authority a provisional veto, was, in our opinion, a useful enactment at that time, but we think it is not suitable to the new conditions already referred to, and we recommend the Association to assent to a reasonable modification of the terms of that section.

The provision giving local authorities the power of purchase also calls for consideration as affecting the position of local authorities supplying energy outside their municipal boundaries. Where this has been authorised, the purchase by an outside local authority of the part of the undertaking in its area would undo the work done in the way of reducing the cost of supply through increased and diverse demand, and consumers throughout the whole area would suffer in consequence. We suggest, therefore, that it should be no longer obligatory to apply to undertakings authorised by provisional orders the provisions of the Electric Lighting Act, 1888, as to purchase. Where, however, rights of purchase already exist we do not think that there should be any interference with them, except upon agreed terms.

A less important provision relating to the promotion of Provisional Orders is contained in Sec. 4 (1) of the Electric Lighting Act, 1882, which requires notice of the intended application to be given to the local authority on or before the first day of July in the year in which the application is made. This was amended by Sec. 9 of the Electric Lighting Act, 1909, by enabling the local authority to waive its right to receive the notice. These provisions have no doubt been useful in the past, but, on the other hand, the necessity to give the notice, unless waived, is liable to cause the loss of a year in obtaining statutory powers, and constitutes, therefore, a hindrance to the extended supply of electricity, and we accordingly recommend that the provisions should be repealed.

Another step to be taken to ensure a cheaper supply of electricity would be to encourage and facilitate the linking-up of two or more generating stations in neighbouring areas, thereby making more economical use of their plant and allowing some of the stations to be closed at times when the demand is reduced, and in some cases to close down stations which, by reason of the general alteration of areas of supply, linking-up, and other economical considerations, have become unnecessary. The adoption of this course in any particular case must necessarily depend upon the circumstances and upon the terms that can be arranged.

Suggestions have been put forward from time to time with reference to uniting in one department the functions now performed by various Government Departments in connection with electrical matters. The department primarily concerned in the supply of electricity is the Board of Trade, who make the Provisional Orders, and who under those Orders and the Electric Lighting Acts have numerous duties to perform. The authority for sanctioning loans for electricity purposes is, however, the Local Government Board, and the Home Office have certain powers in connection with the use of electricity in factories and some other matters. Some advantage would, no doubt, be derived from uniting these several powers in the hands of one department, but we are doubtful whether the scheme would prove altogether practicable, and we further think that the disadvantages attaching to the setting-up of any fresh Government Department would outweigh any advantages there may be; it would, however, be well to strengthen the technical side of the Board of Trade. If any changes are made in regard to Government Departments on this subject, we trust that nothing will be done to relieve them of their responsibility to Parliament.

Board of Trade Committee on Electric Supply.—In connection with the above, at the last meeting of the Bristol Electrical Committee, the following resolutions were passed:—
“That this Committee are surprised and disappointed that the I.M.E.A. has not been invited to nominate a member for the Board of Trade Committee, and further resolves that the Board of Trade be again requested to appoint one or two members recommended by the I.M.E.A. on the Committee, so that the technical side of the municipal case can be adequately represented.

“That the chairman and Mr. Serenington, and the engineer and general manager be requested to interview members of Parliament on the matter.”

The Bradford Electricity Committee has received a letter from the Hammersmith B.C. intimating that its Electricity Committee felt that all Electricity Committees should combine for the purpose of demanding that the Board of Trade Committee as at present constituted should be dissolved, and that a new Committee consisting of a small number of competent, unbiased persons, not directly interested in electrical matters, should be constituted in lieu thereof.

It was decided fully to endorse and support the action taken by Hammersmith.

Scottish Electricians' Wages.—Sir Richard Lodge, Edinburgh, arbitrator in a difference between the Electrical Contractors' Association of Scotland and the Electrical Trades Union, has issued the following award, dated June 25th:—

The workers concerned in the employ of firms in the Electrical Contractors' Association shall receive the war advances granted by the Committee on Production to the shipbuilding trades on March 1st last, on the terms laid down in the Committee's award. Payment of these war advances shall be on and from the first full pay day of the current month. I grant no change in the payments for country money, in the assurance that employers will make allowance whenever extra expenditure is involved on a country job.—*Glasgow Herald.*

Institution and Lecture Notes.—**Canadian Electrical Association.**—The twenty-seventh annual meeting of the Canadian Electrical Association, the first convention of this kind since the European war began, was held at Montreal on June 7th and 8th. It was very well attended, particularly by engineers and executives of systems in the Eastern Provinces of Canada, and was most encouraging in retrospect and prospect. Mr. D. H. McDougall, of the Toronto Power Co., who was recently elected vice-president of the National Electric Light Association, was re-elected president of the Association. In his address President McDougall outlined the difficulties imposed on the Canadian companies by the war, and said the industry had passed through, perhaps, the most eventful year since the founding of the first central-station company in 1881. The demands for energy had in most cases been abnormal, owing to munition manufacture, and to the fact that Canada herself was prosperous, but all the conditions had been met by the companies for the most part, in spite of the inroads on operating and commercial staffs, and difficulties of financing and of securing fuel. Both in Montreal and in Toronto about 35 per cent. of the normal number of men employed have enlisted.

Mr. Julian C. Smith, chief engineer and vice-president of the Shawinigan Water and Power Co., Montreal, read a paper showing the enormous use made of electricity since 1870, and presented the following list showing the kw.-hours used per capita as supplied by the electric service companies in the United States and Canada for all purposes except railways:—

	kw.-hours per capita.		kw.-hours per capita.
Shawinigan Falls, Que.	41,000	Minneapolis	450
Niagara Falls, N.Y.	33,000	Cleveland	400
Three Rivers, Quebec	3,400	Boston	350
Montreal	700	Philadelphia	250
Toronto	700	New York	225
Buffalo	585	Quebec	200
Pittsburg	500	Newark	180
Rochester	450		

To-day in the United States and Canada, in those places where normal industrial life exists, the kw.-hours used per annum per capita amount to about 500, of which 400 kw.-hours are used for factory purposes and 100 kw.-hours for household uses. With the increased use of small accessories and the development of electric cooking Mr. Smith predicted that the use of electricity in the household would increase 300 per cent. within the next five or six years. At the same time, the industrial use is bound to increase, so that there is every probability that in 10 years from to-day the use of electrical energy will be twice what it is at the present time.

—*Electrical World.*
Society for Electrical Development.—The results of the \$1,250 prize contest, conducted by the Society in connection with the nation-wide house-wiring campaign, April 1st to May 15th, has been announced. The Society offered 35 prizes, ranging in value from \$150 to \$10, to employees of member companies in cities of five classes, from under 15,000 inhabitants to 500,000 and over. For contest purposes, the definition of a contract was construed as “a signed agreement with a new customer for wiring at least three rooms with four sockets or over, in a house already built, located along existing lines, and requiring no other than ordinary service connection.” In two classes there were two winners of the seventh prize. The 37 prize winners wired 2,663 houses, an average of 72 houses each, or an average of two houses during each working day during the six weeks of the contest, and connected up 1,813 kw., an average of 49 kw. each. Salesmen not eligible for entrance in the campaign contracted for wiring over 10,000 houses.

Electric Smelting of Titaniferous Iron Ores.—Prof. Albert Stansfield, McGill University, has recently prepared an article for the Canadian Department of Mines dealing with a big magnetite deposit in Quebec. According to the *Financial Times*, he states that on the north shore of the Saguenay River, Province of Quebec, is a deposit of titaniferous magnetite estimated to contain from 1,000,000 to 5,000,000 tons of ore. Electric power may be obtained at two points on the river—9 miles west and 12 miles east of the deposit. Charcoal and limestone, necessary for electric smelting, are conveniently situated. The ore contains approximately 50.53 per cent. Fe, 10.55 Ti, 0.02 S, 0.03 P, and is susceptible to magnetic separation, yielding a concentrate containing approximately 56.20 per cent. Fe and 8.3 Ti, by which it will be seen that either crude or concentrated, a titaniferous magnetite must be treated. It is stated that 175 tons of concentrates treated in an electric furnace such as is used in Sweden would, with the addition of 0.4 ton charcoal and 0.5 ton limestone, produce 1 ton of pig iron. The electrical power required would be approximately 3,000 kw.-hours per ton of metal produced. To smelt the original ore 0.4 ton of charcoal and 0.7 ton of limestone or dolomite would be required and about 3,500 kw.-hours per ton of pig iron would be consumed. Assuming a plant to consist of three furnaces of 4,000 H.P. each and the output to be 80 tons per day, the total cost of pig iron would be about \$21, and it would be marketable as an exceptionally high-grade iron.

Electric Heating and Cooking.—Under this title we published on June 1st part of a paper purporting to be read by Mr. C. Scott before the Birmingham and District Electric Club. The paper, we find, was read by Mr. R. Weaving before the club on February 13th, 1915, while the paper read on May 12th, 1917, was one by Mr. E. K. Scott, entitled “Electric Furnaces for Nitrates from the Air.” We regret the mishap, due to a contributor's error and tender our apologies to Mr. Weaving.

The Marriott Concrete Pole.—The accompanying illustration shows a 30-ft. triangular hollow telegraph pole, constructed of reinforced concrete on the system patented by Mr. W. Marriott, of Melfou Constable. Many such poles have been erected on British railway lines, which also use the system for signal posts, gate posts, girders, sleepers, and other purposes. The manufacturers and licensees are Messrs. John Ellis & Sons, Ltd., of Leicester, and

MARRIOTT TELEGRAPH POLE.

Mr. W. Jones, of 154-5, Upper Thames Street, E.C., is sales agent. It is claimed that with the Marriott system of reinforcement, posts, &c., can be so designed as to weigh little more than double as much as wood, with greater strength, and that the work is not only cheap—in some cases cheaper than wood—but also practically everlasting.

The British Westinghouse Changes.—Commenting on the sale of the American holding in the British Westinghouse Co., the *New York Electrical World* says:—

"A powerful financial group in London, through the control of the British Westinghouse Co., the French Westinghouse Co., and the Italian Westinghouse Co. are said to have further plans which will rival the great German company, the Allgemeine Electricitäts Gesellschaft. It is significant that the American Westinghouse Co. not only retains a financial interest in this combination, but that the sale of its shares is based upon and made in connection with an agreement of alliance with the London group under which the American company trades in the Western Hemisphere and the Far East, including Asiatic Russia, and the British company in Europe, Africa, and Australia, each company representing the other as sole agent in its respective territory for business that naturally gravitates towards the other. This is especially interesting as it is the first great Allied business combination that has been announced since the beginning of the war, and marks another important development in the affairs of the Westinghouse Co.

Fatalities.—An inquest was held at Bolton, last week, on George Edward Hosler (32), who was employed at the Corporation electricity works cleaning a switchboard, when he caught hold of a live wire by mistake, and was killed. A verdict of "Accidental death" was returned, and the jury recommended that cubicles containing live wires should be locked, so as to prevent any future accident.

An inquest was held at Dudley, on Friday, concerning the death of W. H. Dudley, aged 29, who met with fatal injuries while following his employment at the Electric & Ordnance Accessories Co., Saltley, Birmingham. He was engaged on a circular saw, cutting timber, when a piece of the wood flew back and struck him in the abdomen, causing a rupture of the intestines. The saw was driven by a 7½-h.p. motor. Verdict, "Accidental death."

Irish Peat and Electrical Power.—Strong representations are being made to the Government for the appointment of an expert in electrical engineering on the Committee set up by the Department of Scientific and Industrial Research to inquire into Irish peat resources, and, as peat is such an important factor in electrical development, it is being urged that there should also be some connecting link between the Committee and that appointed by the Board of Trade to inquire into the question of electrical power for industrial purposes. Sir John Griffiths, of Dublin, is chairman of the Irish Committee.

Educational.—**BOARD OF EDUCATION.**—The transfer of the offices of the Board of Education to a part of the premises of the Victoria and Albert Museum took place during the first week in July. As from July 9th, the official address of the Board will be at the Victoria and Albert Museum, Exhibition Road, South Kensington, London, S.W. 7. The official telephone number will be Western 804. The main entrance door to the offices for persons having official business with the Board will be the door in Exhibition Road, hitherto used as the western entrance to the Museum. The President, the Parliamentary Secretary, the Permanent Secretary, the Permanent Secretary of the Welsh Department, and the Chief Medical Officer will continue to occupy rooms in the Board's present offices in Whitehall. Personal letters to them may be addressed to Whitehall. Telephone number, Victoria 6,082.

UNIVERSITY COLLEGE, LONDON.—The new chemical laboratories at University College have been designed to meet the requirements of modern chemical teaching and research, including provision for physical chemistry, in which branch immediate and rapid progress is urgent. The cost of the site, building, and equipment will be £120,000; £100,000 has already been raised, and Sir Ralph C. Forster, who has already subscribed generously to the cost of the laboratories, has promised £5,000 on condition that the remaining £15,000 is raised speedily. Subscriptions may be sent to Lord Glenconner at the College.

Appointment Vacant.—The Liverpool Education Committee wants a lecturer in electrical engineering (£250) for the Central Municipal Technical School.

Some Uses of Magnetic Separators.—The use of a series of magnets of different strengths makes it possible to separate materials having different magnetic permeabilities and also to separate magnetic from non-magnetic ores or concentrates. In treating monazite sands, magnetite is removed by the weakest magnet, ilmenite by the intermediate, and monazite by the strongest. The non-magnetic material passes away, giving three concentrated products. Magnetic separators of the multiple-pole type have found application in the dressing of zinc ores. Marmatite, a ferruginous sphalerite, is slightly magnetic, and is separated from the raw pyrite by the most powerful magnet. Non-magnetic zinc-iron sulphide ores require a slight roast to make the pyrite magnetic, and the separation of these two constituents is accomplished by low-strength magnets. Franklinite, fowlerite, and garnets are separated from willemite, zincite, quartz, mica, and calcite by means of such machines.

Magnetic separation seems to be in use in several tungsten camps in the United States. It is absolutely essential that the concentrates obtained from tungsten mills be high grade and uniform in composition. The magnetic tungsten minerals, wolframite, huebnerite, and ferberite, lend themselves particularly well to treatment by the magnetic separator, according to some authorities. In the wet concentration of tungsten ores, the heavy sulphides of iron, lead, zinc, &c., as well as the heavy oxides of tin, magnetic iron, arsenical sulphides, carbonate of lead, garnets, and other impurities pass off the tables and contaminate the tungsten concentrates. The multipolar magnetic separator completely eliminates these detrimental minerals. Again, there is no market for a mixed product of tungsten and tin, or for wolframite and scheelite mixed, as each of these minerals requires a different method for the extraction of the tungstic acid. By passing the combined wolframite-scheelite concentrates over the magnetic separator, the wolframite is removed by the magnets, while the non-magnetic scheelite passes off at the end of the machine.

Magnetic separation is also possible for the following: the separation of pyrrhotite from other sulphides, garnet, or gangue; of roasted chalcocopyrite from garnet and epidote; of roasted chalcocopyrite from iron or nickel sulphides; of magnetite from weakly magnetic minerals; roasted limonite from smithsonite and calamine; pyrolusite from quartz gangue; leucite from lava; magnetite from corundum; magnetite, menaccanite, chromite, and pyrrhotite from diamond-bearing concentrates; magnetic galena (probably iron-bearing) from zinc ore and gangue; and, finally, hematite from gangue minerals.—*Metallurgical and Chemical Engineering.*

Additions to the B.E.A.M.A. Membership.—The B.E.A.M.A. announces that the following firms have been elected members of the Association:—

Adamson, Daniel & Co., Ltd., Manchester.	Heenan & Froude, Ltd., Manchester.
Andrews, Cuthbert, London.	Macfarlane Eng. Co., Ltd., Cathcart.
Benjamin Electric Ltd., London.	Micanite and Insu., Ltd., London.
Burnley Ironworks Co., Ltd., Burnley.	Newton & Wright, Ltd., London.
Butt, Fredk. R., & Co., Ltd., London.	Newtons, Ltd., Taunton.
Cambridge Scientific Instrument Co., Ltd., Cambridge.	Pinchin, Johnson & Co., Ltd., London.
Cavendish Elec. Co., Ltd., London.	Pirelli General Cable Works, Ltd., London.
Cosser, A. C., Ltd., London.	Reid Bros., Eng., Ltd., London.
Cox, Harry W., & Co., Ltd., London.	Roberts, Wm., & Sons, Ltd., Nelson, Lancs.
Creed & Co., Ltd., Croydon.	Saxon, George, Ltd., Manchester.
Davey, Pixman & Co., Ltd., London.	Schall & Schall, London.
Dean, A. E., & Co., London.	Small Elec. Motors, Ltd., Beckenham.
Douglas & Grant, Ltd., Kirkcaldy.	Submersible and J. L. Motors, Ltd., Southall.
Gent & Co., Ltd., Leicester.	Urmson & Thompson, Ltd., Oldham.
Greville, Ernest, London.	Wood Bros., Sowerby Bridge.
Hathorn, Davey & Co., Leeds.	

Auction Sale.—By order of the Controller in the case of the United Machine Tool Co., Ltd., Messrs. Wheatley Kirk, Price and Co. will, on July 25th, offer the stock of 350 lots of new machine tools, also the goodwill of the business, &c., for sale by auction. Particulars will be found in our advertisement pages.

Congress of Civil Engineers.—On the initiative of the Société des Ingénieurs Civils de France, a Committee has been constituted to organise a general congress of civil engineering of the Allied nations. The purpose of the congress will be the scientific, technical, and economic organisation of all industries. The first meeting will take place in November next, and will be of a purely national character; later on, the Allies will be invited to assist at a second session. One of the 10 sections of the programme (Section VI) is entitled "Electricité Industrielle," but almost all are of more or less interest to electrical men.—*Revue Générale de l'Electricité.*

Conference of Electrical Engineers in India.—We have received a copy of the proceedings and report of the second Conference of Electric Inspectors and Electrical Engineers to Government, which was held in Calcutta last December. The volume, which was edited by Mr. J. W. Meares, Electrical Adviser to the Government of India, can be obtained from the Superintendent, Government Printing, Calcutta, price 3s. 7d. The proceedings dealt with questions of law and the interpretation of the Indian Electricity Acts; the Indian Electricity Rules, 1911, including draft rules for electricity in mines; electric inspectors and Government electrical engineers; questions relating to licensees and consumers; matters relating to electric wiring and installations; electrotechnical questions, &c.

In his opening speech the chairman, Mr. J. W. Meares, pointed out that India was in advance of England in respect of wayleaves, as transmission lines there could be run as though they were telegraph lines. The total number of licensed undertakings was only 21, owing mainly to the difficulty of obtaining capital; when it was obtained in the home market promotion expenses were apt to mount up and drown the enterprise with "water." Lately indigenous capital had taken a hand, and the undertakings so financed were paying dividends—but they should see to it that they did not neglect their reserve and depreciation funds. Another difficulty was the scattered character of the area of supply in Indian towns, but this was partly off-set by the domestic fan load, which resulted in exceptionally high load factors. The jerry-wiring trouble was a thorny problem, which needed attention, and the Indian Electricity Rules required amendment.

Draft rules for electricity in mines were approved, and numerous points in connection with the general rules were considered. It was decided that the testing pressure for high-pressure lines and apparatus should be applied for one minute instead of half an hour, and should be twice the maximum working pressure, but in no case less than 2,000 volts; the Electric Inspector could accept the manufacturer's tests as complying with the rule, and where the normal working pressure exceeded 6,600 volts, the test pressure need not exceed the working pressure. It was also agreed that the use of high-pressure motors under 20 H.P. should be prohibited. The rule for wind pressure on overhead lines was considered on the basis of meteorological records, which showed that the maximum pressures recorded varied widely in different areas, and it was resolved that the specified pressures to be provided for should range from 10 lb. per sq. ft. on the plains in the interior, up to 40 lb. in certain exposed coastal districts. It was held that in all new licences the British standard pressures should be adopted, and that steps should be taken with a view to the modification of existing undertakings in the same direction. In connection with contracts, it was resolved that where a contractor proposed to use material of other than British manufacture, the country of origin should be stated in the tender, and that the use of British standards for accessories was desirable. Proposals for licensing contractors and workmen were discussed. The next conference is to be held in Bombay in January, 1918.

Training Disabled Men.—The Leeds Corporation has given permission for disabled soldiers who are being trained for electrical work under the direction of the Local Naval and Military War Pensions, &c., Committee to attend the electricity works for instruction, at the discretion of the manager.

The British Association.—Sir Arthur Evans is to be president of the British Association for another year. Sir Charles Parsons will preside at the meeting which it is hoped to hold at Cardiff next year.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—The Burnley Tramways Committee recommends that the salary of Mr. MÖZLEY, general manager, be increased from £450 to £525 per annum.

Walthamstow U.D.C. has confirmed the appointment by the electrical engineer of Mr. G. L. SMITH as station superintendent, at £175 per annum, rising to £200.

The Heckmondwike D.C. Electricity Committee declined to grant an increase of salary to Mr. CARTER, the electrical engineer, under present circumstances, but referred applications for increased wages from the workmen to the Working Committee.

Tunbridge Wells T.C. has granted an honorarium of £50 to the borough electrical engineer, Mr. R. N. TORRY, for services rendered in laying down new plant, &c., without a consulting engineer being engaged.

Mr. W. J. BEST, who was appointed on probation in January last, by the Sheffield City Council, as shift engineer at Kelham Island power station, has been transferred to the official staff at £180 per annum.

Walsall Corporation Tramways Committee proposes to increase the salary of the tramways manager by £100 a year.

The Walsall Electricity Supply Committee has placed on record its high appreciation of the valuable services rendered by Mr. T. LLEWELLYN as clerk of works at the Birchells generating station, and has decided to pay him £25 for his extra services.

Burton-on-Trent T.C. has agreed to Mr. HALL, the electrical engineer, rendering part-time service to assist on the technical side of the Government Coal Distribution Scheme. Mr. Hall was nominated by Mr. Wilson, Technical Adviser to the Controller of Mines, Steam Raisers' Section. Mr. Hall's duties will be to visit the various works in the district selected using coal supplies, and to advise on questions relating to the necessary class and grade of fuel which the firms need to carry on their businesses.

Sheffield Electric Supply Committee has decided that the salary of Mr. H. E. YERBURY (deputy general manager and engineer) be increased from £600 to £700 per annum.

Mr. A. S. HUGHES, electrical engineer with the Carron Co., Ltd., Falkirk, was on Monday evening appointed electrical engineer to Falkirk Corporation, at £325 per annum. Mr. Hughes served his apprenticeship with Messrs. Ernest Scott and Mountain, Ltd. Eleven years ago he became electrical engineer at the Carron Iron Works.

Mr. ROBERT CAVEN, who for the past 10 years has been manager of the Bessbrook electric tramway, has retired. He has been succeeded by Mr. Robert Hamilton, of Bessbrook.

General.—Mr. J. A. LYCETT, general manager of the Black Country tramway systems, is in a new list of Magistrates for Staffordshire.

Mr. THEODORE ZETTEL, of 30, Gloucester Square, Hyde Park, and 67, Queen Victoria Street, London, electrical engineer, has changed his name to Theodore Settle.

Mr. A. W. MAKOVSKI, electrical engineer of Reigate, and Mr. J. E. J. GOUNDRY, electrical engineer, of Reigate, have been elected members of the Council of the Reigate and Redhill Chamber of Commerce.

Corporal YATES, East Lancs. R.E., elder son of Mr. Walter Yates, of Messrs. Matthews & Yates, Ltd., has been gazetted second-lieutenant in the R.E.

At Falwood Parish Church, Sheffield, on June 30th, the marriage took place of Mr. W. MEDLEY, electrical engineer, of Wootseats, Sheffield, and Miss Margaret Crofts, Pontefract.

Mr. F. R. C. ROUSE, who has been connected with Messrs. Venner and Messrs. Chamberlain & Hookham for some years, and is now a Lieutenant and I.O.M. in the Army Ordnance Department, would be glad if Old Students of the Electrical Department of Finsbury Technical College would in future communicate particulars of their doings, &c., to Mr. J. F. Shipley, 35a, Upton Road, Birkenhead, instead of to himself.

Mr. H. C. GREENWOOD, M.I.E.E., chief electrical engineer to the Amritsar Municipal Committee, has been called to war service, and is appointed Electrical Garrison Engineer, Lahore Cantt., in the Military Works Department, and was gazetted on May 3rd, 1917.

Messrs. George Schultz & Co., Ltd., electrical insulation manufacturers, &c., announce that their managing director, Mr. GEO. SCHULTZ (though not at any time a German subject), has by Deed Poll changed his name to George Leonard Scott. No change, however, has taken place in the title of the company, which is composed entirely of British subjects.

Roll of Honour.—We regret to see in the list of wounded officers the name of Major B. ZIANI DE FERRANTI, M.C., R.G.A.

We regret to state that Mr. WILLIAM WILMOT, who was one of Messrs. Falk, Stadelmann & Co.'s country representatives for 15 years, latterly covering more particularly the Manchester district, has died after a few days' illness from pneumonia. He recently joined the R.N.A.S., and was attacked almost immediately with the illness which caused his death. His loss will be keenly felt by his many trade friends.

Private REGINALD CLAUD WHEWELL, who was employed at the Lancashire Electric Power Co.'s station at Radcliffe, has been awarded the Military Medal for keeping up communications under shell fire. He was awarded the D.C.M. in the Battle of the Somme. He is 21 years of age.

Corporal EDGAR JACKSON, West Riding Regiment, who was previously an electrician with Messrs. R. F. Winder, Leeds, has been awarded the D.C.M. for gallantry displayed in making raids on enemy trenches and bringing back prisoners early in June. Three months ago he was awarded the Military Medal.

Private L. S. ROE, Tyneside Scottish, who is in hospital at Exeter, wounded, was employed by the Phoenix Dynamo Co., Ltd., Bradford.

Private C. V. WHITEHEAD (21), who before joining the King's Own Royal Lancasters was serving his apprenticeship as an electrical engineer with Messrs. Storey Bros., Ltd., White Cross Mills, Lancaster, is reported to have died of wounds.

Company-Sergeant-Major G. LEWIS, Sherwood Foresters, reported killed, after being missing since September 3rd last, was an employé of Messrs. Fraser & Chalmers, Erith.

Private A. BANNISTER, Sherwood Foresters, presumed killed after being missing since October 31st last, was with Messrs. Whiting & Taylor, electricians, Derby.

The Times reports that Second-Lieutenant LEONARD SOLOMON, K.O.S.B., who was killed on April 23rd, aged 32, was educated partly at the City and Guilds Engineering College, at South Kensington. He was in Canada when he joined the Forces, but on medical grounds was discharged. He accordingly underwent an operation, came to England, and got a commission. He was an Associate Member of the I.E.E.

Mr. LAURENCE A. GRIPPER, an official at the Blackburn electricity works, who is now a motor-ambulance driver in the Friends' Ambulance Unit of the British Red Cross, attached to a division of the French Army in France, has had conferred upon him the Croix de Guerre—the equivalent to our D.C.M. He is one of five members of the unit to be thus distinguished for conspicuous bravery in rendering ambulance service to the wounded under heavy shell fire, and the presentation was made by a French General at a parade and march past which was ordered as a special honour to the recipients. All the chief officers present shook hands with them, and the proceedings will be formally communicated to the Commanders-in-Chief of the French Army (General Petain) and the English Army (General Sir Douglas Haig).

Captain G. S. THORNE, R.F.C., who, according to the Times, had been missing since March 18th, died of wounds on that day after bringing his machine safely to earth. He was engineer to the Chinese Government power and lighting station at Canton.

Obituary.—ALD. J. MILES.—Ald. John Miles, J.P., the "father" of the Bolton Town Council, died last week at the age of 76 years. For over 40 years he was a member of the Council, and was Mayor in 1901-3. He was Chairman of the Gas Committee when electric lighting was undertaken, and, in addition to laying the foundation-stone of the new electricity works in December, 1893, he switched on the current at the "opening" in the following October. For close on 14 years he was Chairman of the Tramways Committee, and last year was elected Chairman of the Municipal Tramways Association. He was chairman of several companies, including Meters, Ltd., and the Standard Lamp Co., Ltd.

NEW COMPANIES REGISTERED.

C. A. Carpenter, Ltd. (147,868).—Private company. Registered July 3rd. Capital, £4,000 in 3,000 10 per cent. non-cumulative pref. shares of £1 and 20,000 def. shares of 1s. each. To take over the patent rights of C. A. Carpenter connected with burglar and fire alarms, and to carry on the business of electrical and general engineers, &c. The subscribers (each with one pref. share) are: C. A. Carpenter, 38, Brailsford Road, S.W. 2, electrical engineer; A. H. Freeman, 5, Holborn, E.C. 1, secretary. The first directors are to be appointed by the subscribers. Registered office: 79, Gresham Street, E.C.

Grove Engineering & Utilities, Ltd. (147,860).—Private company. Registered July 2nd. Capital £1,500 in £1 shares. Ironfounders, engineers, manufacturers of agricultural implements, electrical engineers, manufacturers and dealers in aeroplane parts, dry-cell battery manufacturers, chemists, druggists, drysalers, manufacturers of and dealers in cases and parts for electric torches, &c. The subscribers (each with one share) are: A. Maher, 29, Croft Road, Merton, S.W. 19, accountant; Miss T. H. Cole, 9, King's Road, Wimbledon, S.W. 19. The first directors are A. Maher and Miss T. H. Cole. Registered office: 196, Merton High Street, Wimbledon.

Fleetway Press, Ltd. (147,853).—Private company. Registered June 30th. Capital, £10,000 in 4,700 pref. and 4,700 ord. shares of £1 each and 12,000 founders' shares of 1s. each. Printers, &c. Agreement with Electrician Printing & Publishing Co., Ltd. The subscribers (each with one share) are: A. Morris, 18, Richmond Avenue, Kingston Road, Merton Park, S.W., printer's manager; A. J. Wilder, 61, Tradescent Road, South Lambeth Road, S.W., accountant. The first directors are to be appointed by the subscribers. Remuneration, as fixed by the company. Solicitors: Biddle, Thorne, Welsford & Gait, 22, Aldermanbury, E.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Veritys, Ltd.—Mortgage dated June 26th, 1917, to secure £3,850, charged on freehold land, Arrol Works (in the occupation of Jointless Rim, Ltd.), coal basin, &c., at Aston, Birmingham. Holder: G. H. Cartland, Boveré Cottage, near Worcester.

Electrical Contracts & Maintenance Co., Ltd.—Particulars of £3,000 debentures created June 20th, 1917, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

African Direct Telegraph Co., Ltd. (21,895).—Capital, £300,000 in 110 shares. Return dated June 6th, 1917. 23,600 shares taken up, £296,000 paid. Mortgages and charges: Nil.

CITY NOTES.

Marconi International Marine Communication Co., Ltd.

Mr. GODFREY ISAACS presided at the annual meeting last week in the absence of Mr. Marconi, who was representing his Government on a Special Commission to the United States. After going over the accounts, Mr. Isaacs said that in view of the fact that their business was still being conducted under exceptionally unfavourable conditions the figures were satisfactory. Practically the whole of their profits were derived from ships' subsidies, for there was practically nothing doing at the present moment in commercial or private telegrams at sea. Normally they derived a very substantial revenue from those telegrams, and when Peace conditions returned they would no doubt see a very substantial increase in receipts from this source. Not only had the number of ship telegraph stations been immensely augmented during the war, but there had been also a large addition to the coast stations, which would give far greater facilities for communication with the land than obtained prior to the outbreak of hostilities. They were making very considerable losses in consequence of the submarine warfare, all of which they were debiting to profit and loss account. It was to be hoped that those losses would cease, and that they would show additional revenue in consequence. They felt justified, having regard to the sound development of the business, to recommend an increased dividend, which they felt confident of being able to at least maintain, notwithstanding the necessity for increasing the capital. Up to June 30th this year they had already fitted 595 additional ships, making the total number of ships installed, after deducting losses, 1,855, which was by far the biggest rate of increase in the history of the company. Orders on hand were very considerable indeed, and they would be very largely increased in the near future. For that they must make provision. After referring to the additions made to the board, the chairman paid a tribute to the staff. To June 16th they had 3,347 operators and students. Of these, to that date 333 had been saved from vessels sunk, 45 were drowned, 29 had been injured, one killed, and 19 had been taken prisoners of war. A number of instances of splendid heroism were given by the speaker. One man had been torpedoed three times within three months, standing to his post unflinchingly on each occasion; they had now given him a post on shores, because if his nerves had not suffered they ought to have done so.

The net profits for the year ended March, 1917, were £265,220, plus £48,053 brought forward, making £313,273. After deducting debenture interest and normal and special depreciation amounting to £38,541, £274,732 is available, and it is appropriated as follows:—6 per cent. preference dividend, £42,000; employees and managing director's bonus, £18,468; 10 per cent. dividend on ordinary shares, free of tax, £62,500; reserve, £40,000; grants to war dependants, £11,477; repayments of income-tax to preference shareholders, £10,500; balance to carry forward (subject to excess profits duty, if any), £89,786. The reserve account has been increased by £100,000 transferred from pre-war suspense accounts of provision for contingencies which have not arisen, and with the addition of the above £40,000, the total amount to the credit of the account will be £400,000. The operations during the year consisted mainly in continuing and developing the policy initiated at the outbreak of the war. The results have again been satisfactory. The works have all been fully occupied, and almost exclusively in the production of material and electrical equipment for war purposes, so that practically the whole of the output normally employed in the supply of the electrical trade has been diverted to meet such purposes and for controlled establishments. About 1,700 members of the staff and workpeople were now serving with the Colours, so that substitution and dilution of labour had become more imperative than ever. Thanks, however, to the loyalty and united efforts on the part of those members of the company's technical and commercial staff whom the authorities had allowed to remain, it had been possible to overcome successfully most of their difficulties. The scarcity of raw material and the difficulty in obtaining machinery, together with the Government restrictions placed upon all building operations, had not enabled the company to proceed with the preparations for the developments awaiting the electrical industry after the war. Capital expenditure during the year on new works of immediate importance had amounted approximately to £15,000, and £11,000 had been expended, under permit from the authorities, to advance the Kingsway building sufficiently to protect the steelwork. The sales organisation at home and abroad had adapted itself well to prevailing conditions, as was evidenced by the year's results. The investment account of the company had again considerably increased, with an eminently satisfactory return. Nearly £300,000 had been invested in the Osram-Robertson Lamp Works, Ltd.; a further £50,000 had been required by the Pirelli-General Cable Works, Ltd.; and certain smaller sums had been invested in minor factories essential for the production of material for the company's requirements. The Pirelli-General Cable Works, in which the company was largely interested, had this year—the second year of its existence—

shown satisfactory results. All the allied and subsidiary companies continued to do well, with the exception of one or two which had been adversely affected by conditions of war. During the year Mr. Fred S. Sells retired from the board. Annual meeting: July 17th.

We give below the comparable figures from the reports for the three years ended March, 1915, 1916, and 1917:—

	1915.	1916.	1917.
Net trading profit and income from investments ...	£161,877	£196,275	£265,220
Depreciation and debenture interest ...	26,855	27,260	38,541
Prof. dividend ...	38,681 (6 %)	42,000 (6 %)*	42,000 (6 %)*
Available balance ...	136,081	163,716	274,732
Managing director's and employees' bonus ...	9,931	12,701	18,468
War grants ...	7,182	12,962	11,477
Ordinary dividend ...	48,142 (10 %)	50,000 (10 %)	62,500 (10 %)
To reserve account ...	20,000	40,000	40,000
Balance carried forward ...	36,701	48,053	89,786
Reserve fund total ...	220,000	260,000	400,000

* A resolution is to be brought before the annual meeting authorising the payment of a special bonus at December, 1917, to the then registered holders of preference shares, the sum payable to be equal in amount to the total income-tax deducted from the dividends paid in respect of the said shares on December 31st, 1916, and June 30th, 1917.

Edmundsons' Electricity Corporation, Ltd.

The net profit for the year ended March, 1917, after providing for mortgage and debenture interest and redemption, and for £1,165 additional income-tax, amounts to £12,294, as against £13,259 last year. Adding £4,625 brought forward, the total profit available is £16,918, out of which £12,000 is required for dividend on the preference shares, and £4,919 is to be carried forward. We extract the following figures from the schedule, showing gross profits of subsidiary and other companies for the years 1915 and 1916:—

	Gross profit (before providing for capital charges and depreciation).		Load connected in kw.	
	1916.	1915.	1916.	1915.
Alderley ..	£2,813	£3,060	1,133	1,092

	£187,441	£190,238	99,095	92,423

* Nine months.

The Lancashire Co.'s figures are included for the first time. The total capital expenditure increased during 1916 from £3,826,409 to £3,854,931.

The Paris Metropolitan Railway.

The report of the *Compagnie du Chemin de Fer Metropolitain de Paris* for 1916 first gives the customary details concerning the works carried out by the City of Paris on the one hand, and by the company on the other. After mentioning that the terminal trunk Opera-Palais Royal No. 7 line was opened on July 1st, the report states that the average length of the network was 48½ miles, of which two miles were worked by the company for the account of the City. The service and the working of the trains were further improved in the measure which was compatible with the difficulties incidental to the maintenance of the rolling stock and the necessity to spare it. At the end of 1916 the rolling stock comprised 703 motor cars, 270 first-class trailers, and 335 trailers for second-class passengers. A beginning was made in 1915 in the direction of providing the doors of the second-class carriages with electro-pneumatic pushers, which permitted of the doors being automatically closed from a distance. This measure was generalised in 1916, and was extended to the end doors of the first-class carriages. In addition, no seats had been provided in a certain number of compartments in some of the second-class carriages for the use of passengers with bulky parcels.

The accounts show total receipts from passenger traffic and sundry receipts amounting to £2,311,000, the working expenses having been £1,089,000. The ratio of working expenses to receipts was 47.14 per cent., as compared with 43.69 per cent. in 1915. After deducting the share paid to the City out of the gross revenue according to the terms of the concession—£755,000, as contrasted with £596,000 in 1915—and after meeting the interest charges on the loan capital of £5,000,000, the accounts show net profits of £271,000, which has permitted of the declaration of a dividend at the rate of 5.6 per cent.

on the ordinary share capital of £3,000,000, leaving £56,000 to be carried forward. The report also deals with the difficulties arising from the scarcity and dearness of raw and other materials, and states that the coal bill alone increased by £240,000 in 1916 as compared with a normal year. Under the circumstances, the directors had approached the City of Paris, whose share in the profits had largely increased, with a view to securing a revision of the concession contract, so that one of the parties should not have to incur all the risks and the other obtain larger profits due to unforeseen circumstances. At the same time permission is being sought to raise first-class fares, so as to defray the cost of war increases already granted to the company's servants.

Swiss Companies.

The Société Paul Girod, of Neuenburg, earned gross profits of £418,000 in 1916, as compared with £143,000 in the previous year, the net profits being £281,000 and £57,000 in the two years respectively. It is proposed to pay a dividend of 10 per cent., as against 8 per cent. in 1915. The company is to be amalgamated with the *Acieries Girod, of Ugine, France*, by means of an interchange of shares.

The Motor A.G. für Angewandte Elektrizität, of Baden, which owns electricity supply works, and is interested in others, reports that the demand experienced by these works in 1916 was exceptionally active, although it was impossible to raise prices in proportion to the growth in the cost of production. It was to be assumed that constructional work in regard to new undertakings would be brisk after the war, especially in those countries which were largely dependent upon imports of coal, and which would develop their water power resources. The accounts show net profits of £90,000, as compared with £89,000 in 1915, and a dividend at the rate of 7 per cent. is proposed on the ordinary share capital of £1,200,000, being the same as in each of the four preceding years.

The Société Franco-Suisse pour l'Industrie Electrique, of Geneva, which is an investment company, reports that no occasion arose in 1916 for embarking upon new business, but various subsidiary companies experienced considerable development in which the company participated within the limits of its funds. The losses on the rate of exchange, which was again seriously felt, had been equalised by the higher quotations which prevailed for a number of securities as contrasted with 1915. The receipts from interest, dividends, and other investments reached £75,000, as against £74,000 in the previous year. After defraying general expenses and meeting interest on the loan capital of £879,000, the accounts show net profits, including £4,000 transferred from the special reserve fund, amounting to £44,000, as compared with £11,000 in 1915. It is intended to pay a dividend of 4 per cent. on the share capital of £1,000,000, this contrasting with no distribution in 1915 and 1914, and 5½ per cent. in 1913.

Electric & General Investment Co., Ltd.—Mr. J. B. BRAITHWAITE, presiding at the annual meeting of the company last week, said, according to the *Times*, that since the outbreak of the war the ordinary financial business out of which the company usually made its living had been almost non-existent. They had therefore simply to conserve their resources and quietly await the return of peace. Instead of paying a dividend, the board considered it better to strengthen the company's financial resources.

Chile Telephone Co., Ltd.—During the year ended at March, 1917, the subscribers increased by 936 to 14,243. The total length of lines in operation increased by 1,379 miles. The gross revenue advanced by £30,209 to £152,182, and the total expenditure (exclusive of income-tax) by £26,674 to £92,597. The net revenue was £59,584, an improvement of £3,535. Dividend already paid 3s. per share, free of tax; a final dividend of 5s. per share is now recommended; £16,386 is put to reserve, and £2,000 to reserve against loss on investments, carrying forward £5,202.

Havana Electric Railway, Light & Power Co.—The accounts for 1916 show a net profit of \$2,421,291, as compared with \$2,236,257, and an available sum, including \$1,709,956 brought forward, of \$4,131,248, out of which dividends amounting to 6 per cent. on the common shares have been paid, as compared with 5½ per cent. for the previous year, and after transferring \$75,000 to reserve for depreciation, and \$123,083 to reserve for bad and doubtful debts and other adjustments, \$2,024,501 remained to be carried forward.—*Financial Times*.

Dublin United Tramways (1896), Ltd.—Interim dividend, 4 per cent. per annum (4s. per share), less tax, on ordinary shares.

Sao Paulo Tramway, Light & Power Co., Ltd.—Dividend of 2½ per cent. on the issued common stock.

Direct United States Cable Co., Ltd.—Interim dividend, 2s. per share, less tax, for the quarter ended June.

Fraser & Chalmers, Ltd.—Interim dividend of 7½ per cent. on the preference shares, less tax.

Winnipeg Electric Railway Co.—There is a decrease of \$35,742 in net income, and no dividend is recommended for 1916.

Dublin United (Electric) Tramways, Ltd.—Interim dividends, 6 per cent. per annum, less income-tax, on the preference shares, and 4 per cent. per annum, less income-tax, on the ordinary shares.

STOCKS AND SHARES.

TUESDAY EVENING.

AERIAL, rather than financial, interest has been a feature in Stock Exchange markets this week, although it is surprising how very quickly London settles down to its accustomed grooves as soon as immediate danger is past. Brisk business has been done in aircraft policies—brisker than that, in fact, which has characterised the market in stock and shares. At the same time, the strength of the latter is extremely well maintained; and the way in which the prices of Consols, the War Loan, and other gilt-edged securities keep up constitutes something of a standing marvel to those who preach a forthcoming War Loan and, as a sequel, further depreciation of values.

Home Railway stocks continue to make an extremely good showing; and there has been a little more inquiry for some of the home electrical shares. Amongst telegraphs, West Coast of America shares are once again better; while in the group of cable manufacturing concerns, the scarcity of shares remains the outstanding feature.

The Home Railway market is one of the best in the House. At first, the demand centred upon the stocks of the trade lines, but the improvement quickly spread to others, and the Undergrounds were included in the all-round firmness. Underground income bonds have risen to 83½, Metropolitans to 24½, and Districts to 16½. The near approach of the half-yearly dividend payments is held responsible for the renewed attention that has caused the rises in prices. Holders of the stocks naturally do not want to sell at this particular season of the year, so that it takes very little demand to produce an effect which in reality is exaggerated.

West India and Panama shares have risen to 28s. 9d., and, amongst the heavier cable stocks, Eastern ordinary is good at 140½. The rest of the list is distinctly strong. Attention is being called in the market to the shares of the Marconi Marine Co. as being cheap and holding possibilities of early improvement. Maybe the prophets will turn out right, because the present price of 47s. 6d. includes the dividend recently declared, and, judging from the statements made at the meeting at the end of last week, the Marine Co. is doing extremely well. In the shares of the parent undertaking there is little going on, and apparently the recent operators intend to see what the Government is really going to do before they—the buyers—venture further into the market.

Oriental Telephones are ½ up at 2½, which seems a remarkably high price, considering the extremely trifling yield afforded at that level. The company's last report was a good one, and showed that amounts equal to about 20 per cent. had been placed to various reserves, so obviously anticipation is looking for an increase in the next dividend. Still, the probable advance is certainly discounted in the present figure. Of the manufacturing shares, Callenders are 5s. better at 13½, and Henleys are 10s. up at 16, both of them being difficult to get hold of. Castner-Kellners eased off to 3 5/16.

There is not much doing amongst home electricity shares. The feature continues to be the strength of the London varieties. Cities at 12½ and Counties at 10½ are both half-a-crown higher on the week, and Counties changed hands within the last day or two as high as 10½. South Metropolitan preference drooped to their par price of £1, the return being, therefore, 7 per cent. on the money. Having regard to the appetite which has sprung up just lately for sound preference shares in the industrial market, South Metropolitan preference do not look dear.

The General Electric Co. aroused considerable interest with its dividend announcement at the rate of 10 per cent. on the ordinary shares, free of tax, at the same time recommending the repayment to the preference shareholders of the income-tax for two half-years. The question immediately arose as to whether this latter action was *not ultra vires*, but it was taken for granted that the directors were fully armed with the necessary powers to carry out the recommendation—otherwise they would hardly have made it.

The company's gross profit for the year ended March 31st last came to £265,220, an increase of nearly £70,000 over that of the previous twelvemonth. The reserve fund is strengthened by £100,000, making it £400,000 altogether; and £89,876 goes forward, against £18,000 brought into the accounts. Upon this, the price of the ordinary shares rose to 16 and the preference to 10, these prices being somewhat nominal, inasmuch as there are very few shares to be obtained. The preference bonus is a substantial one, but the directors announce that it is in respect of one year only.

Armament shares keep good, though some irregularity has developed in the iron and steel group as a whole. Amongst

rubber shares, there was a fall upon the refusal of the Chancellor of the Exchequer to modify the incidence of the excess profits duty, though subsequently the list rallied upon a re-reading of the speech and appreciation of the fact that the Chancellor did not entirely close the door upon some possibility of relief being afforded. The base-metal list is steady, the strength of the commodities helping to keep prices good.

ELECTRICAL WORK IN THE TROPICS.

[COMMUNICATED.]

THE white man in the Tropics very seldom does any manual work. It is true that, owing to the advances of medical and engineering science, life in such regions is much more healthy for the European than it used to be. Where the sun's rays are vertical, however, the manual labour of the world is, and should be, done by the native. The European adjusts himself to new conditions, and, whether it is because he finds the climatic conditions enervating, or whether it is that he wishes to maintain the white man's prestige, the fact remains that he seldom, if ever, does manual work in the Tropics.

Unfortunately, the climatic conditions of that belt of the earth's surface which lies near to the Equator are especially bad for all electrical apparatus. The atmosphere is usually saturated with moisture. The degree of humidity is almost unbelievable. Often the walls inside the buildings have water running down them, and it is, of course, quite impossible to have wall papers for decorating the interior of houses. In many parts of the Tropics granite is found, and great masses of rock or stone act as condensers. They cool at night, and in the early morning, when the sun heats the air, the atmosphere deposits its moisture when it is brought against the comparatively cool surface of the stone. This humidity affects clothing; a pair of boots which look normal at sundown will grow a peculiar greenish-blue covering before sunrise.

From these few remarks it will be seen that the electrical engineer in the Tropics has much to try him. Nothing could be worse for insulation than such a climate. Nothing is worse for the nerves than the joint effect of climate and native indolence. For the races which inhabit the equatorial regions are most exasperating, when they are employed in industrial work. Nature has so richly endowed mankind in the Tropics that, until the restless energy of the white man sought to reduce chaos to order, the inhabitants had no incentive to work. The fecundity of the animal and vegetable world is so great that food is obtainable with but little exertion, while there is no need to provide clothing.

The New Conditions.—The earth is changing rapidly, and the native of the Tropics is being lifted up out of his state of indolence and savagery by the new civilisation. The world is so small, that the fighting on the battle fields of Europe will determine the methods by which the economic development of the Tropics will take place. The German method of dealing with natives was brutal. It is not racial conceit to state that no nation has more successfully developed tropical regions than the British. The secret of our success has been honest administration and the stimulus of great rewards to all men who would show enterprise. An example of what is possible for any man to do, irrespective of colour, is furnished by the case of the late Mr. Loke Yeow, C.M.G. The Chinese who became a British subject, and died a sterling millionaire, left his native village, near Canton, in China, a penniless coolie. He went South to the tropical regions of the Malay States, and, by dint of industry and the opportunities given to him by a generous system of government, he amassed a fortune.

Machinery is needed in the Tropics, and as cultivation of the agricultural products is intensified and the mines are developed, more and more electrical apparatus will be needed. Efforts are being made to train the young generation of natives, and technical education will certainly stimulate a demand for machinery. But the technical education should be for the non-commissioned officers; Europeans will always direct and take the initiative. It is folly to expect the native of, say, Java, to become suddenly intelligent enough to become a captain of industry. Such human material has its limitations, and that fact must be recognised.

The Technical Difficulties.—There are all sorts of engineering problems to be solved in the Tropics which never occur in temperate climates. There should be some inducement offered to electrical engineers in such regions to place on record their experiences. Take the simple case of storage batteries. The humidity of the atmosphere affects

them, and there are other difficulties. It may be that some special design of battery is necessary. It may be that most of the troubles one hears about are almost entirely due to neglect and ignorance. (If the white man is inexperienced, the native will certainly encourage neglect.) It may be that temperature conditions affect the plates. It may be that all would be well if pure water were used. Whatever the reasons, the fact remains that storage batteries have a bad reputation in the Tropics. Let us obtain some definite data as to their life and actual working behaviour in such a climate. The writer has not had sufficient experience to offer anything except suggestions. It does seem to be either a fact, or a superstition, that storage batteries should be worked at below their rated capacities when they are used in the Tropics. If it is a fact, perhaps there is a known reason.

The white people near the Equator demand the new conditions of life. They expect electric light and the priceless boon of the electric fan. They will demand electric motors for ice plants in the near future. Telephones, and even electrically driven carpet-sweepers, are among the first inquiries of the bride out from home. The market for one type of electrical apparatus, the fan, must be enormous: the demand must run almost into millions per annum, and the demand increases each year.

The problem which awaits the Allied nations as soon as peace is concluded is the systematic exploitation of the vast resources which Nature has placed in the Tropics. In that great work of reducing chaos to order the electrical engineer will play a prominent part. Those who have had experience in the Tropics should be encouraged to place on record the methods by which they have overcome the many difficulties which beset them.

ELECTRIC STEEL FURNACES.

WITH SPECIAL REFERENCE TO THE GREAVES-ETCHELLS TYPE.

By E. KILBURN SCOTT, A.M.Inst.C.E., M.I.E.E.

SINCE the war, one of the most striking developments of the steel industry of Great Britain has been the rapid increase in number of electric steel furnaces; so successful have they been that the prejudice against this type of furnace is rapidly disappearing, and the change will probably rank as the most radical one since the time of Bessemer.

Amongst factors which have helped to bring the electric furnace into favour are the war demand for special tool steel for tools, dies, gauges, &c.; the demand for chrome and other special alloy steels for aircraft tubing, rustless steel, &c.; the difficulty in obtaining Swedish iron, which, besides being scarce, is extremely expensive; the difficulty in obtaining skilled labour to work the crucible steel process; the necessity of profitably using turnings, millings, ends of tubes, bars, and other scrap steel; and the ease with which high-class steel can be made from second-grade materials in electric furnaces.

Certain electric supply authorities, as, for example, those at Sheffield, Newcastle, Rotherham, and Luton, have done much to encourage electric furnace loads by reducing charges for energy, and by moderating the requirements as regards power factor, the unbalancing of phases, &c. The foresight of the city electrical engineer at Sheffield is especially commendable in preparing for an electric furnace load.

For the manufacture of high quality steel castings the electric furnace is ideal. The superiority of electric steel castings over those made by any other process has been conclusively proved by the extremely severe conditions to which these castings have been subjected under specialised war conditions. The castings produced can be finished off dead mild, and a 1-in. square bar can be bent double as cast, no expensive annealing operations being necessary. The carbon contents usually vary between .2 per cent. and .25 per cent., while the sulphur and phosphorus are each reduced below .015 per cent., and manganese and silicon are adjusted to suit the work.

The tensile properties of ordinary electric cast steel are:—

Maximum tensile strength ... 35 tons per sq. in.

Yield point ... 25 tons per sq. in.

Reduction of area, 50 per cent. Elongation, 30 per cent.

The maximum tensile stress can be readily increased to even 100 tons per sq. in. by the introduction of special elements, such as nickel, chromium, and vanadium.

Many works that sell their steel swarf and scrap, cast-iron borings, &c., at very nominal prices, and purchase all their steel castings, could very profitably install an electric furnace and make their own castings from the scrap. The charge can be made up entirely of scrap and turnings; no expensive

raw materials are necessary. The melting loss is almost negligible, while in other processes it is from 7 per cent. to 15 per cent.

Steel from the electric furnace is finished off under a reducing atmosphere of carbonic oxide and a slag out of which the metallic oxides have been reduced, and is singularly free from blowholes when properly cast. This is due to the elimination of the gases that molten steel usually holds in solution, and the ease with which the steel can be poured into small and intricate moulds, flowing smoothly like milk, and setting perfectly quietly, is largely due to its purity.

For small, light castings furnaces of not more than 30 cwt. are recommended; steel of such low carbon content has a high melting point, and must be cast at a very high temperature, and though the temperature is easily obtainable in the furnace, difficulties occur in handling large quantities of such hot metal in ladles if a large number of castings are to be made. For small, mild steel castings—many of which have proved a better substitute for malleable iron castings—smaller furnaces are recommended, and several firms have installed furnaces of 10 cwt. capacity to melt steel for small engine parts of motor cycles and motor cars instead of using stampings.

Where large quantities of good quality steel are required "The Hot Metal Process," as it is called, combines cheapness and quality. It has been adopted extensively in the United States. The metal is first heated in a basic lined, tilting, open-hearth furnace of large capacity, and is then run into

SECTION THROUGH SIX-TON GREAVES-ETCHELLS FURNACE, SHOWING CIRCULATION OF METAL.

a number of electric furnaces for final refining and addition of alloys. The process is continuous, and as the energy for the first melting of the steel is obtained direct from fuel, the amount of electrical energy is only that required to maintain the temperature during refining and the assimilating of the alloys. Steel so produced commands high prices.

Electric furnaces are used for the melting of ferro alloys for open-hearth and Bessemer plants, as it is found much more economical to make alloy additions in the molten form. The electric furnace is ideal for this.

TYPES OF FURNACES.

As the earlier furnaces were for small outputs, single-phase alternating current was used, and to obtain a balance on a polyphase supply several furnaces had to be worked together.

Polyphase furnaces are better than single-phase furnaces, because for a given output of steel one such furnace is cheaper, takes up less room, and requires less attention than several single-phase furnaces. With single phase, if one arc fails the circuit is broken, and the load falls to zero. This is liable to happen during the melting-down period, when the pieces of scrap metal change position under the electrodes.

Some arc furnaces have all the electrodes above the bath of metal, one of this class being the *Heroult*. As arranged for three-phase supply it has three vertical electrodes through the roof, and the arcs are between each electrode and the bath, so that the molten metal forms part of the electrical circuit. Two furnaces, namely the *Girod* and the *Snyder*, employ water-cooled steel studs, which pass right through the bottom or hearth. As the ends of the studs project into the metal of the charge they burn away, and have to be renewed at intervals. This form is also not good practice, because of the danger of the metal finding its way through the hearth, and the liability of trouble with water connections. It will be noted that in all the above-named furnaces the refractory material of the hearth does not require to carry current. The material may be, therefore, either acid (silica) or basic (magnesite).

The furnaces mentioned below have also bottom electrodes, but come under a different category because the hearth itself

conducts electric current. It is, therefore, made of magnesite material, as this, when heated, is a fairly good conductor. A furnace of this class is that of Electro-Metals, Ltd., which was invented by Gronwall. It works with two phases, and has two electrodes above the bath, whilst a third electrode below the hearth acts as a common neutral for the two phases.

Another furnace which has met with considerable success is that of Greaves-Etchells, more than 30 having been installed or put under construction since January, 1916. This is an all-British production, both in inception and manufacture.* It is designed to operate on a three (or two) phase supply, and has two of the phases connected to electrodes above the bath, the third phase being connected to a copper plate below the electrically conductive hearth of magnesite.

The roof is made of silica bricks, as these are fairly good insulators. They are set in a steel framing which rests on the silica brick walls projecting above the steel body of the furnace. The roof is domed and brought as low as possible, so as to reduce the wasting away of the electrodes by the action of the gases. A roof will last about 100 heats, and a duplicate one is provided with each furnace, so that the steel melting can be carried on, except for the short time taken to change the roof.

In order to obtain an even temperature through the bath of molten metal in the electric furnace, it was realised that heat must be applied below, as well as above, the bath, and in order to effect this the hearth of the furnace is specially constructed.

Above 12 per cent. of the total energy of the Greaves-Etchells furnace is used in the hearth, and the "bottom heating" which results is found to be of great advantage in melting down alloys. The heavier alloys—chrome, tungsten, vanadium, and nickel—sink to the bottom of the bath, and if there is no bottom heating are apt to remain for a considerable time in a semi-fluid state.

The hearth lining is never less than 20 in. thick, and is constructed mainly of dolomite and magnesite, in such a manner that the electrical resistance is high at the inside of the bath in proximity to the charge, and decreases rapidly to a negligible quantity at the outside. The current flowing through the hearth generates a considerable amount of heat immediately below the liquid in the most efficient manner possible, while the electric arcs arranged over the bath maintain the slag and surface at the desired temperature.

The effect of this bottom heating is to cause convection currents in the molten metal, which ensure a constant circulation, and a uniform product. The outside of the furnace bottom remains cold, little or no heat being lost in this direction.

This system of connection at first sight would appear to cause an out-of-balance load on the primary supply, but the system of transformer ratios is arranged to give a perfect balance when the upper electrodes are in equal adjustment.

The Greaves-Etchells system of transformer connections is such that the short-circuit current of one electrode must traverse two transformers in series and in different phase, which automatically lowers the power factor momentarily, and has a very strong buffer effect; the fact that there is always a permanent resistance in the path of the current through the hearth also limits very considerably the effects of short circuits. The combination of these factors provides the most effective means yet devised for protecting the supply system from shock, while allowing a high power factor to be obtained on normal load.

For the manufacture of high-speed steels or special alloy steels, a $\frac{1}{2}$ -ton or 1 $\frac{1}{2}$ -ton furnace is usually adopted, and the former can finish a charge from cold material and alloys in two to two and a half hours, with an energy consumption of 400 units.

To make up a charge from scrap, it is usual to place steel turnings and millings on the hearth, then pieces of bar and rail ends, tube ends, and finally large pieces of steel. The interstices between the large pieces are filled with turnings, &c., and some iron ore may be added. The amount of iron ore depends on the amount of iron oxide present in the form of rust on the scrap.

As the charge is melted, a slag of lime and fluorspar is made in order to eliminate the phosphorus as phosphate of lime. After this phosphate slag has been skimmed off, a new slag is made of best Buxton lime, fluorspar, and white sand in the proportions of 30, 10, and 5. When this has fluxed, a small quantity of finely powdered anthracite coal is spread on the slag, and this is continued until the slag is deoxidised.

The steel is thus finished off under an atmosphere of carbonic oxide and a slag out of which the metallic oxides have been reduced. When entirely deoxidised a sample of slag falls to a fine white powder as it cools. Deoxidisation of the slag results in deoxidisation of the steel, through the constant reduction of silicon from the slag, and it may be hastened by addition of small quantities of ferro-silicon.

* The Greaves-Etchells furnace was described, with illustrations, in the ELECTRICAL REVIEW, April 13th, 1917.

As a comparison with the crucible steel process, it may safely be stated that a 10-cwt. electric furnace running a charge every two and a half hours, or, say, nine charges per day, will do as much as 36 crucible furnace holes each having two 56-lb. pots.

The electric furnace is operated by one skilled man, one unskilled man, and one ammeter boy, whereas the crucibles require 15 men, most of whom are skilled, or, at any rate, classed as indispensable. At two Sheffield works, girls are employed to regulate the electrodes.

Such an electric furnace, with its transformers and switch-gear, will occupy about a quarter of the space occupied by the crucible plant, and the initial cost of the electric furnace will be about half that of the crucible plant.

The charge of the electric furnace can be made entirely from turnings, millings, &c., whereas in the crucible steel process only a very limited quantity of turnings, &c., can be used.

Owing to the low heat efficiency and high cost of labour, crucible steel is much more expensive to manufacture. The cost of renewing crucibles is considerably higher than the renewal of an electric furnace for the same output. Already several steel works have shut down their crucible plant after installing electric furnaces.

The introduction of the Bessemer and open-hearth processes of making steel left crucible steel makers indifferent owing to the fact that these methods were employed for making ordinary kinds of steel in great quantity for structures, rails, &c. The coming of the electric furnace is a different proposition, as it competes directly and successfully in the special field that the crucible steel process has held so long.

The crucible steel process has been largely responsible for great waste of the nation's resources by reason of the coke being made in beehive ovens, this quality of coke being necessary for the crucible steel process. The introduction of the electric furnace should help to stop this waste in the future.

In conclusion, it may be mentioned that very soon there will be 50 electric furnaces at work in the Sheffield district, and the output of steel from them will be at the rate of over 200,000 tons per annum.

In the United States over 100 electric furnaces are already at work, and a single electric steel plant is being erected in South Chicago which will give an output of 200,000 tons per annum.

In view of the rapidly increasing demand for high-grade steels, makers cannot afford to be second-best, and electric furnaces offer the only certain method of obtaining and holding the market.

TRADE STATISTICS OF INDIA.

THE following figures of the imports of electrical and similar goods into British India in the year ended March 31st, 1916, are taken from the recently-issued official trade statistics; details for the year ended March 31st, 1915, are added for purposes of comparison, and notes of any increases or decreases are given:—

	1914-15.	1915-16.	Inc. or dec.
<i>Brass, wrought.—</i>	£	£	£
From Great Britain ...	31,000	46,000	+ 15,000
„ Germany ...	2,000	—	— 2,000
„ Italy ...	4,000	—	— 4,000
„ Other countries ...	30,000	72,000*	+ 42,000
Total ...	67,000	118,000	+ 51,000

* Japan £42,000.

Copper and copper ware.—

	1914-15.	1915-16.	Inc. or dec.
From Great Britain ...	950,000	309,000	— 641,000
„ Germany ...	487,000	45,000	— 442,000
„ Belgium ...	12,000	10,000	— 2,000
„ France ...	126,000	7,000	— 119,000
„ Austria ...	2,000	—	— 2,000
„ Japan ...	254,000	108,000	— 146,000
„ Other countries ...	18,000	15,000	— 3,000
Total ...	1,849,000	494,000	— 1,355,000

Iron wire.—

	1914-15.	1915-16.	Inc. or dec.
From Great Britain ...	82,000	140,000	+ 58,000
„ Germany ...	19,000	1,000	— 18,000
„ Belgium ...	7,000	1,000	— 6,000
„ United States ...	26,000	71,000	+ 45,000
„ Other countries ...	5,000	1,000	— 4,000
Total ...	139,000	214,000	+ 75,000

Prime movers, other than locomotives.—

	1914-15.	1915-16.	Inc. or dec.
From Great Britain ...	428,000	268,000	— 160,000
„ Germany ...	1,000	—	— 1,000
„ United States ...	10,000	14,000	+ 4,000
„ Other countries ...	8,000	5,000	— 3,000
Total ...	447,000	287,000	— 160,000

	1914-15.	1915-16.	Inc. or dec.
<i>Electrical generators.—</i>	£	£	£
From Great Britain ...	11,000	8,000	— 3,000
„ Other countries ...	1,000*	7,000†	+ 6,000
Total ...	15,000	15,000	—

* Belgium £1,000. † Italy £6,000.

Electrical motors.—

	1914-15.	1915-16.	Inc. or dec.
From Great Britain ...	71,000	50,000	— 21,000
„ Germany ...	1,000	—	— 1,000
„ United States ...	1,000	2,000	+ 1,000
„ Other countries ...	3,000*	2,000	— 1,000
Total ...	76,000	54,000	— 22,000

* Italy £2,000.

Other electrical machinery.—

	1914-15.	1915-16.	Inc. or dec.
From Great Britain ...	213,000	120,000	— 93,000
„ Germany ...	6,000	—	— 6,000
„ Italy ...	4,000	9,000	+ 5,000
„ United States ...	6,000	10,000	+ 4,000
„ Other countries ...	1,000	2,000*	+ 1,000
Total ...	230,000	141,000	— 89,000

* Switzerland £1,000.

Mining machinery.—

	1914-15.	1915-16.	Inc. or dec.
From Great Britain ...	49,000	63,000	+ 14,000
„ Switzerland ...	—	9,000	+ 9,000
„ United States ...	48,000	58,000	+ 10,000
„ Other countries ...	1,000	2,000	+ 1,000
Total ...	98,000	132,000	+ 34,000

Machinery, other (except textile, agricultural, and printing).—

	1914-15.	1915-16.	Inc. or dec.
From Great Britain ...	563,000	387,000	— 176,000
„ Germany ...	22,000	1,000	— 21,000
„ Italy ...	—	3,000	+ 3,000
„ United States ...	34,000	30,000	— 4,000
„ Other countries ...	17,000	13,000	— 4,000
Total ...	636,000	434,000	— 202,000

Electric fans.—

	1914-15.	1915-16.	Inc. or dec.
From Great Britain ...	28,000	19,000	— 9,000
„ Italy ...	10,000	26,000	+ 16,000
„ United States ...	13,000	25,000	+ 12,000
„ Germany ...	2,000	—	— 2,000
„ Other countries ...	2,000	—	— 2,000
Total ...	55,000	70,000	+ 15,000

Electric lamps and parts.—

	1914-15.	1915-16.	Inc. or dec.
From Great Britain ...	24,000	40,000	+ 16,000
„ Germany ...	3,000	—	— 3,000
„ Austria ...	2,000	—	— 2,000
„ Japan ...	—	1,000	+ 1,000
„ United States ...	—	4,000	+ 4,000
„ Other countries ...	2,000	9,000*	+ 7,000
Total ...	31,000	54,000	+ 23,000

* Holland £7,000.

Electric wires and cables.—

	1914-15.	1915-16.	Inc. or dec.
From Great Britain ...	149,000	145,000	— 4,000
„ Germany ...	2,000	—	— 2,000
„ Japan ...	—	2,000	+ 2,000
„ United States ...	1,000	2,000	+ 1,000
„ Other countries ...	1,000	2,000*	+ 1,000
Total ...	153,000	151,000	— 2,000

* Italy £1,000.

Other electrical instruments, apparatus, &c. (except telegraph and telephone materials).—

	1914-15.	1915-16.	Inc. or dec.
From Great Britain ...	290,000	257,000	— 33,000
„ Germany ...	7,000	—	— 7,000
„ Japan ...	—	7,000	+ 7,000
„ Austria ...	1,000	—	— 1,000
„ United States ...	19,000	20,000	+ 1,000
„ Other countries ...	6,000	12,000*	+ 6,000
Total ...	323,000	296,000	— 27,000

* Holland £6,000.

Scientific, &c., instruments.—

	1914-15.	1915-16.	Inc. or dec.
From Great Britain ...	63,000	48,000	— 15,000
„ Germany ...	2,000	—	— 2,000
„ United States ...	1,000	7,000	+ 6,000
„ Other countries ...	3,000	9,000*	+ 6,000
Total ...	69,000	64,000	— 5,000

* France £4,000.

Telegraph construction materials.—

	1914-15.	1915-16.	Inc. or dec.
From Great Britain ...	18,000	10,000	— 8,000

	1914-15.	1915-16.	Inc. or dec.
	£	£	£
Machinery. —			
From Great Britain ...	212,000	127,000	— 85,000
„ United States ...	—	1,500	+ 1,500
„ Other countries ...	1,000	500	— 500
Total ...	213,000	129,000	— 84,000
Telephone construction materials. —			
From Great Britain ...	17,000	18,000	+ 1,000
„ Sweden ...	—	3,000	+ 3,000
„ Other countries ...	—	1,000	+ 1,000
Total ...	17,000	22,000	+ 5,000
In addition to the foregoing, the following were imported as Government stores:—			
Instruments, apparatus, &c. (except musical). —			
From Great Britain ...	181,000	171,000	+ 10,000
„ Other countries ...	2,000	1,000	— 1,000
Total ...	183,000	172,000	— 11,000
Iron wire. —			
From Great Britain ...	10,000	16,000	+ 6,000
Telegraph construction materials. —			
From Great Britain ...	102,000	80,000	— 22,000
Copper and copperware. —			
From Great Britain ...	113,000	128,000	+ 15,000
„ Other countries ...	78,000	238,000*	+ 160,000
Total ...	191,000	366,000	+ 175,000

* New South Wales £193,000.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

TRANSIT OF GOODS THROUGH FRANCE.—The Board of Trade are informed that for goods in transit through France to Switzerland which are accompanied by the "pink certificate" issued by the British Customs Authorities, no transport permits are required:—(a) When consignments (without limitation as to weight) are sent *via* Bordeaux, Cette, or Marseilles on Swiss rolling stock; and (b) when consignments are sent *via* other French ports (except Havre) in Swiss trucks, to the amount of one metric ton a day from any one shipper to any one consignee. In all other cases it is necessary to obtain a transport permit from the 4th Bureau of the Ministry of War, in Paris.

PERU.—The Peruvian Customs Bulletin for January 8th contains a Decree dated December 27th, 1916, providing that the duties of 2, 4, and 6 per cent. prescribed by the earlier Decree—referred to in the REVIEW of January 5th last—are to be levied on the market prices of rubber from the Yavari, i.e., the reduction of 30 per cent. from the current prices allowed in respect of rubber from the Madre de Dios is not to be allowed for rubber from the Yavari.

NEW ZEALAND.—An Order-in-Council, dated February 5th, prohibits the importation of electric apparatus known as the Violetta high-frequency generator, and of all accessories specially adapted for use therewith, and of all written or printed advertising matter relating solely or principally to such apparatus.

CANADA.—By a recent decision of the Customs Department, the rates of import duty on electric welded furnaces to be used in the manufacture of boilers for ships or vessels are leviable as follows:—20 per cent. *ad val.* under the Preferential tariff, 2½ per cent. *ad val.* under the Intermediate tariff, and 30 per cent. *ad val.* under the General tariff. [It should be noted that in addition to these duties, a war tax of 5 per cent. *ad val.* is levied under the British Preferential Tariff, and of 7½ per cent. *ad val.* under the Intermediate and General Tariffs.]

FRANCE AND ALGERIA.—A French Ministerial Decree, dated May 12th, amends and amplifies the Decree of April 13th restricting the importation of goods into France and Algeria—see the REVIEW for June 1st. Among the articles added by the new Decree to List No. 3 (goods the importation of which is placed under the control of the Inter-Ministerial Commission of Woods and Metals) are:—Frames and carcasses of dynamos and of electric motors; armature spiders; covers of electrical collectors; solid poles of dynamos and alternators, of iron or steel, wrought or swaged, of cast iron or steel, of malleable cast iron, of shaped or welded plate.

Applications for French import licences must now be addressed by the proposed importer in France or Algeria to the competent authorities in France, the issue of such licences in London having been discontinued. The French Customs Office in London (Bank Buildings, Kingsway, W.C. 2) is prepared to advise exporters as to the classification of their goods for the purposes of the import prohibitions and to give general information on the subject.

NEW PATENTS APPLIED FOR, 1917.

(NOT YET PUBLISHED).

Compiled expressly for this journal by Messrs. W. P. THOMPSON & Co., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford.

It may not seem that the political changes that are now in progress in Germany are a matter which directly concern us in these pages, yet we cannot but regard them as important milestones indicating that we are on the way toward the end, and that end assuredly is a matter of the deepest concern for us all. After three years of terrible war, the originators of it may banish their Bethmann-Hollweg because he is not regarded as a fit man to negotiate Peace, but they cannot escape the haunting foot-tread of Nemesis. With all conceivable forms of ingenuity they may try to dodge it, but fate follows relentlessly in the wake of those who have shocked all outside Civilisation with deeds as foul as they have been dishonourable. Many parties seem to be finding their voice to-day, but in the main they are uttering two distinct cries. Peace without Indemnities is the boon clamoured for, and the concession condescendingly approved, by those whom sheer necessity has driven to want Peace speedily at all costs. Peace *with* Indemnities is the demand of those who, looking ahead, see Germany ruined for many a year unless indemnities can be secured to strengthen credit, so that industry may be able to purchase raw materials abroad and re-establish the economic and industrial position which the folly of Prussian ambition has broken up.

We are not suggesting that the end is near—who has any means of knowing?—the position is very involved, and fate only knows the hour of the final issue; but if recent events have brought the only end there can be appreciably nearer than it seemed a few weeks ago, they have also brought nearer for all the nations that period of very serious problems which, as the Chancellor of the Exchequer told the House of Commons, would be more difficult to handle than all the problems of even the war itself. The apostle of gloom is of all men the most unwelcome and the most unhelpful, but the optimist who tries to humour us into the belief that all will be well when the war is ended is a dangerous and an undesirable companion, for the plainest facts of the situation should compel us all to approach the times that lie ahead with the utmost seriousness and foresight. It is not only in the countries that will lose the war that there will be unparalleled difficulties of various kinds to be faced; the nations that win, and the nations that are neutral, will also have their period of anxiety and stress and their own peculiar problems to solve. Nemesis will inevitably punish our enemies, and they will settle between themselves, perhaps quarrel over, their own difficulties. But the effects of colossal expenditures and the disorganisation of three years will be felt by the victors, too, though the problems of the Allies will be different from those of their enemies. There will be a freer inter-trading and a strong bond of sympathy between them, while many markets of the world will be wider open to them than ever before if they are in a position to take advantage of the situation, but the German business man has to learn that he has, through his Government, set practically all the world by the ears, and will not easily regain the prestige of pre-war days. We shall inevitably witness some hard striving for terms which will open the way for economic security and the resumption of former activities. At present the industrial magnates of Berlin and their satellites may recognise

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C. 4.

Telegraphic Address: "AGEEKAY, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 8d.; Canada, £1 3s. 10d. (\$5.80). To all other countries, £1 10s.

the economic menace of the future, but apparently the people are still blinded to their future hardships unless the return of the Stockholm visitors has adequately informed them of the feelings of revulsion of the whole world against them.

So far as the British Empire is concerned, we have been discussing our own after-the-war trade problems ever since the outbreak of war. Great things have been done here, and in the Colonies, which will prevent our falling back into positions of apathy and unpreparedness. Much of our old susceptibility to attack will no longer remain. But the changing phases of the whole war situation throughout the world have necessarily interfered with the elaboration of definite policies respecting trade. Our Government-appointed committees have made their investigations, but apparently, in the opinion of the Government the time has not yet arrived when any concrete propositions can be based upon these and announced. Our relations with our Allies naturally greatly affect these matters, and the conclusions of the Paris Economic Conference were arrived at and adopted before America had brought her vast resources definitely on to our side. We may reasonably anticipate that new economic and trading agreements will be entered into in many directions, and it may well happen that after the war a near approach to commercial co-operation will take place among some of the great peoples who in the past have been in competition with each other. There is the possibility of closer working arrangements being introduced between parts of the British Empire and the United States, and the latter is strengthening some of her concerns so that they may be in a position to defeat any efforts that German trust organisations may be able to put forth abroad.

Before the end, the situation may yet undergo other changes, for we must recognise that most things are still in the melting-pot. The German mind is a thing fearfully and wonderfully made. Looked at from the point of view of the Allies, the economic position can only become worse and worse for her people the longer the war is continued if the Allies remain solid, with the substantial reinforcement of the United States. But the German people cannot speedily throw down the Prussian forces that have brought them face to face with ruin; if they fully knew the temper of the world that is against them they probably would do so in order to save some measure of their former international trade for the millions of workers. Almost inevitably, as it seems, they must yet curse the day when they were first led to bow down before the clay-footed idol of Prussian ambition.

We may leave our enemies to work out their own salvation. Necessity requires that we should centre our attention and effort on our own measures of preparation for the future. A speech recently delivered in the Canadian Senate, by the Hon. Frederic Nicholls, on "The Conservation and Extension of Canadian Trade" shows that anxiety there has led to proposals for immediate preparations to be set on foot for the after-the-war period of disorganisation. "When the war ends," said Mr. Nicholls, "we run great danger of a panic through disorganised trade conditions unless the Government lends a helping hand." He calls for constructive statesmanship and the risking of millions of State funds in the development of trade.

"Constructive statesmanship," based upon a full appreciation of all the difficulties, will be what all our Colonies and the Allied nations will need in the momentous years to come. Heaven grant it may not fail us!

We now have a "Minister in Charge of Reconstruction" in the person of Dr. Addison, whose experience of practical life at the Ministry of Munitions should render him better fitted for the intro-

duction of workable measures for Social Reform. From him and from the Ministry of Labour we shall require much "Constructive Statesmanship."

The Electric Power Supply Committee. INTEREST in the constitution and intentions of the Board of Trade Departmental Committee on Electric Power Supply continues unabated. As reported in our "Notes"

columns to-day, the representation of various interests on that body has been the subject of questions in the House of Commons; not only the municipal supply authorities, but also the provincial companies and the metropolitan undertakings are endeavouring to secure a voice in the deliberations of the Committee. Sir Albert Stanley considers that the Committee as now constituted is sufficiently representative of all parties, and is disinclined to make further additions to its membership.

The demand for direct representation of particular interests on deliberative bodies is a familiar feature of our social system; but we are not at all sure that the principle is a good one. Allowance must be made, no doubt, for personal predilections; a man immersed in a certain mode of thought must necessarily arrive at conclusions in harmony with his experience, and perfect freedom from bias cannot be attained by him. Hence, if members of one section of a profession or trade are appointed on a committee, it is not only fair but necessary that members of other sections, whose interests diverge from those of the former, should also be nominated. But it is the duty of each member of the Committee to endeavour to do justice to all sections, not to further the interests of any one section, and for this reason it would be far preferable that the Committee should be constituted as a judicial body with no sectional interests to serve at all. The idea may be Utopian, but if it could be carried out, it would make for efficiency and justice.

Electric Furnaces. ONE of the most noteworthy of the many advances in electrical applications which the war has directly brought about in this country

is the remarkable popularity which the electric steel furnace has acquired in a short period. It is true that before the war electric furnaces had been installed here and there—mainly in Sheffield—but progress was slow, and manufacturers regarded the new practice as experimental in character, while the irregular nature of the load largely discounted its obvious advantages in the eyes of the central-station manager.

However, war conditions brought the matter to a head in a hurry; the urgent necessity of increased supplies of special alloy steels of the very highest quality, and of utilising all scrap to the best advantage, compelled steel manufacturers to make investigations, with the result so often experienced in connection with the applications of electricity—they found that not only was the output increased and the quality of the product vastly improved by the electrical process, but also the cost of labour was greatly reduced, and the cost of energy was quite reasonable. Moreover, the supply authorities under the new conditions were more solicitous for the fulfilment of the manufacturers' requirements than for the uniformity of their voltage records, and did all in their power to ensure an ample supply of electrical energy. Consequently, the electric furnace has scored a signal triumph, and has proved of inestimable value to the nation. It is for this reason that we have published all the information regarding it that has been available, for the assistance of makers and users of steel furnaces. When the war is over we hope to place before our readers particulars regarding developments in this connection, such as the provision of generating plant, &c., at certain centres, that will astonish them.

THE THEORETICAL CONSIDERATION OF THE VENTILATION OF SUB-STATIONS AND TRANSFORMER HOUSES.

By T. H. WOOD.

ALTHOUGH this subject is so important a factor in the design of sub-stations, it does not always receive the consideration which it deserves, especially as the results obtained by theory agree so well with the conditions found in well-designed sub-stations. *or NO. 2069*

Between the two modes of ventilation, mechanical and natural, it is impossible to fix any hard and fast rule, as each has its own particular advantages, and local conditions must always be the deciding factor. Natural ventilation has the great advantage of utilising the heat derived from the energy losses of the plant, so that the running cost is nil, and the initial cost of the louvre ventilators is not

SECTION OF SUB-STATION WITH SIDE WINDOWS ($k = 0.5$).

excessive. A common form of construction is to have them about 2 ft. high, running the length of the roof. The disadvantage of the louvre type is that it is not easy to vary the ventilating area, so that on light load in winter time the sub-station gets very cold. This can be remedied to a certain extent by employing a double row of windows, made to open and close as desired, and arranged in the form

SECTION OF SUB-STATION WITH LANTERN ($k = 0.6$).

of a roof lantern, thereby serving the double purpose of lighting the centre of the building and providing a means of ventilation which can be regulated.

Mechanical ventilation is usually carried out by means of a propeller fan fitted in a circular hole near the roof, the chief advantage being the much reduced ventilating area required; and if it is fitted in the gable end, it can often be made to assist in the architectural design of the building, but one must not overlook the running cost.

In the following calculations, only the total plant which is likely to be running at one time and at its rated capacity is taken into account. The converting machinery is only designed for overloads over a certain period of time; when the machinery is taking an overload, the total extra

heat given out would probably only balance the heat absorbed in heating the plant and room, &c., through the 20° F. rise allowed, and, for practical reasons, has not been included in the formula.

The power lost in the whole plant, transformers and converters combined, will be converted into heat, so that it is an easy matter to find the exact amount of heat generated in the station.

The power loss is $(100 - \text{eff. per cent.}) \times \text{size of plant in KW.} \div 100$. This will be denoted by $E \text{ kw}$.

To convert $E \text{ kw}$ into British thermal units per minute, $E \text{ kw} \times 1.34 \times 33,000/778 = 56.8 E \text{ kw} = \text{B.T.H.U. per minute.}$

As the specific heat of air is 0.24 , one B.T.H.U. will raise $1/0.24 = 4.2$ lb. of air through 1° F. at constant pressure, and at 70° F. 4.2 lb. of air occupies 55 cu. ft.

The total number of cubic feet of air per minute raised through $(T - t)$ degrees F., where T is the inside temperature and t the outside temperature of a building, is given by—

$$C = 56.8 E \text{ kw} \times 55/(T - t) \quad \dots \quad (1)$$

and this quantity of air will have to pass through the station every minute.

It will now be necessary to find the velocity at which the air will pass through the ventilators due to reduction in specific gravity; this will depend upon the height of the building and the difference in temperature between the inside and outside air, and is given theoretically by—

$$V = 480 \sqrt{[h(T - t)(t + 460)]} \quad \dots \quad (2)$$

where V = velocity of air in feet per minute, and h = height of sub-station from centre of bearings to under side of louvres.

In actual practice this will vary according to the design of the station, and the above should be multiplied by a constant k varying from 0.4 to 0.6, the constant approaching the higher value the nearer the station approaches a straight shaft. The values given below have been found suitable for the particular types of buildings concerned (see figures).

The area of the ventilators will be:—

Cubic feet of air to be removed per minute \div velocity of air through ventilators in feet per minute, and substituting from equations (1) and (2)—

$$A = 56.8 E \text{ kw} \times 55 / (T - t) \div k 480 \sqrt{[h(T - t)(t + 460)]}.$$

This can be greatly simplified if we take the average temperature in England at 62° F. and the permissible rise at 20° F.

The equation then becomes—

$$A = 56.8 E \text{ kw} \times 55/20 \div k 480 \sqrt{[h \times 20/522]} \\ = 156.2 E \text{ kw} / k 480 \sqrt{[0.383 h]}. \quad \dots \quad (3)$$

Where $E \text{ kw}$ = loss of power in KW.; k a constant depending upon the design of the station and varying from 0.6 to 0.4; and h height of louvre ventilators from centre of machine bearings or half height of transformers.

As a practical example, let us take the case of a 1,000-kw. rotary converter with transformers, the combined efficiency being 92 per cent., height of sub-station 25 ft., taking $k = 0.5$.

$$\text{Area} = 156.2 E \text{ kw} / k 480 \sqrt{[0.383 h]} \\ = 12,496/235 = 54 \text{ sq. ft.}$$

One must bear in mind the difference between the ventilation of a sub-station and that of a public building; in the former case, the main object is to keep the temperature within certain limits, and not, as in the case of a public building, to change the air for sanitary purposes. Therefore, the cooling effect of the walls, roof, and windows tends to reduce the ventilating area required in the case of a sub-station, but in the case of a public building this would have the reverse effect if natural ventilation were employed. A better result can, therefore, be obtained by taking into account this loss by radiation, and the following gives the B.T.H.U. loss by radiation per sq. ft. per hour per deg. F. difference between the inside and outside air temperatures:—

Brick wall. Thickness	9 in.	14 in.	18 in.	22½ in.
B.T.H.U. per hour	45	3	25	21
1 sq. ft. of window	1	B.T.H.U.
1 " " skylight	1.03	"
Outside door	0.41	"
Slates	1.04	"
1½ in. boards in roof	0.38	"

As the temperature rise in the station is fixed at 20° F., the total loss of heat in B.T.H.U. per minute is given by—

$$\begin{aligned} \text{Loss B.T.H.U. per minute} &= (\text{area of walls} \times k_1 \\ &+ \text{area of windows} \times k_1 + \text{area of skylight} \times k_1 \\ &+ \text{area of roof} \times k_1) \times 20 \div 60 \\ &= \frac{1}{3} \Sigma (\text{areas} \times k_1), \end{aligned}$$

and this quantity will have to be subtracted from the heat generated in the station, and modifies formula (1)—

$$[56.8 E kw - \frac{1}{3} \Sigma (\text{areas} \times k_1)] \times 55 \div 20 \quad \dots (4)$$

This gives the quantity in cu. ft. of air to be changed after allowing for loss in radiation through the walls, roof, &c., and the modified ventilating area will be from equations (4) and (2)—

$$[56.8 E kw - \frac{1}{3} \Sigma (\text{areas} \times k_1)] \times 2.75/k \times 480 \times \sqrt{(0.383 h)} \quad \dots (5)$$

Working out the previous example of a rotary converter of 1,000 kw. with transformers, the combined efficiency being 92 per cent., height of sub-station 25 ft., again taking $k = .5$, the area of 14-in. brickwork = 1,488 sq. ft., area of glass in roof 216 sq. ft., area of slates on 1½-in. boards 360 sq. ft. —

$$\begin{aligned} [56.8 \times 80 - \frac{1}{3} (1,488 \times .3 + 216 \times 1.03 \\ + 360 \times .38)] \times 2.75/.5 \times 480 \times \sqrt{(0.383 \times 25)} \\ = 50 \text{ sq. ft.} \end{aligned}$$

By taking into account the loss of heat by radiation, the ventilating area has been reduced 4 sq. ft. for a 1,000-kw. machine.

Mechanical Ventilation.—If the ventilation is to be done by fan the quantity of air in cubic feet per minute to be moved will, of course, remain the same as with natural ventilation, and is obtained from equation (4). If a propeller fan is used the diameter can best be obtained from the maker's catalogue, or approximately from the formula—

$$D = \sqrt[3]{[c/0.75 N]},$$

where D = diameter of fan in feet; N = number of revs. per minute; and c = cubic feet of air moved.

By substituting equation (4) in place of c in the above expression—

$$D = \sqrt[3]{[56.8 E kw - \frac{1}{3} \Sigma (\text{areas} \times k_1)] \times 2.75/.75 N}. \quad (6)$$

Working out the diameter of fan required for a station exactly as in the previous example, and taking revs. of fan per minute as 400—

$$D = \sqrt[3]{[(4,544 - 272) \times 2.75/.75 \times 400]} = 3 \text{ ft. 4 in. diameter.}$$

Therefore, by using mechanical ventilation, the area has been reduced by $50 - 8.72 =$ about 41 sq. ft. for a 1,000-kw. set.

Finally, let us consider two cases which occurred in actual practice: the first, a sub-station lay-out of two rotary converters with transformers, each 1,500 kw. rated capacity and 92 per cent. efficiency, one of which only was to be used, the other kept as stand-by. The overall dimensions of the building were 35 ft. \times 50 ft. \times 23 ft. high to eaves and 32 ft. to under-side of ventilators. The radiation areas were 11-in. walls, 1,120 sq. ft., roof slates on boards, 1,250 sq. ft., and glass in skylight 600 sq. ft. In this station the ventilating area was 61 sq. ft., and the temperature rise 15° F. Let us see how this compares with the formula:—

$$\begin{aligned} \text{Area} &= [56.8 \times 120 - \frac{1}{3} (1,120 \times .3 + 1,250 \times .38 + \\ &600 \times 1.03)] \times 2.75/.6 \times 480 \times \sqrt{(0.383 \times 32)} \\ &= (6,816 - 776) \times 2.75/288 \times 1.1 = 16,610/317 \\ &= 52.5 \text{ sq. ft.} \end{aligned}$$

And as the formula allows for a 20° rise, I think the results were very satisfactory.

The second case, one that was much more suitable for

comparison, the station being full of plant under a fairly steady load, was a transformer house with three 500-K.V.A. transformers under full load, the efficiency being 98 per cent. The ventilation was by a fan 2 ft. in diameter, making 600 R.P.M., and the temperature rise about 20° F. The area of 14-in. brickwork was 594 sq. ft., 9-in. brickwork 774 sq. ft., iron doors 242 sq. ft., and roof (slates only) 364 sq. ft.

The diameter of fan required as obtained from the formula is—

$$\begin{aligned} D &= \sqrt[3]{[56.8 \times 30 + \frac{1}{3} (594 \times .3 + 774 \times .45 + 242 \\ &\times 1 + 364 \times 1)] \times 2.75/.75 \times 600]} \\ &= \sqrt[3]{[(1,704 - 377) \times 2.75/450]} = \sqrt[3]{8} = 2 \text{ ft. diameter.} \end{aligned}$$

The formula in this case agrees exactly with the results found in practice.

WESTINGHOUSE TURBO-ALTERNATORS.

THE constant progress that is taking place in the evolution of the turbo-generator causes special interest to attach to two brochures which have been issued by the British Westinghouse Electric and Manufacturing Co., Ltd., describing respectively their steam turbines—high-pressure, low-pressure, mixed, and back-pressure—and their alternators for coupling to them. At an early stage, when licensees of the Parsons type of turbine, the Westinghouse Companies saw the desirability of combining the advantages of the impulse type with those of the reaction type that they were building, and substituted for the high-pressure stages of the Parsons turbine a velocity-compounded element on the impulse principle, thus producing the "disk and drum" type of turbine which has become so popular. Later, after a thorough investigation of the systems available, they took out licences to manufac-

FIG. 1.—DIAGRAMMATIC SECTION OF WESTINGHOUSE-RATEAU HIGH-PRESSURE TURBINE.

ture under the patents of Prof. Rateau, of Paris, and eventually adopted the impulse principle for their standard machines.

It was, however, considered desirable to employ a velocity wheel at the high-pressure end instead of following the pure Rateau system throughout, as the latter would give a pressure inside the casing, with steam at 175 lb. per sq. in. absolute (12.3 kg./cm.²) superheated to 525° F. (274° C.), of 85 lb. per sq. in. (6 kg./cm.²) at 415° F. (213° C.), whereas the modified design, as shown in the accompanying section, fig. 1, enables the pressure in the casing to be reduced to 35 lb. per sq. in. abs. (2.5 kg./cm.²) and the temperature to 265° F. (130° C.), thus lightening the construction and avoiding distortion of the cylinder; at the same time with the velocity wheel the machine is shortened between the bearings, the shaft is stiffer, and the critical speed is raised. While the drum turbine is cheaper to construct, the disk type lends itself to

more accurate calculation of the stresses. Each wheel can be balanced separately on the shaft, and thus the whole spindle is balanced throughout. The drum construction may be balanced statically, but be considerably out of running balance.

For these and other reasons, the British Westinghouse Co. adopted as their standard the pure impulse turbine, having a velocity wheel at the high-pressure end and the Rateau impulse wheels for the succeeding stages.

The steam first expands through nozzles in which its potential energy is partly converted into kinetic energy, acquiring sufficient velocity to do work efficiently on two rows of moving blades, the intermediate fixed blades being merely deflecting or guide blades. After the steam leaves the velocity wheel its expansion is con-

The blade wheels are of the finest wrought steel, of taper section, and are machined all over: large holes are provided to ensure that the pressure on both sides shall always be the same.

The blades are machined out of the solid bar to a curve defined by a former fixed on the machine, so that they are all exactly alike in shape and weight. The methods adopted for attaching them to the wheels are shown in figs. 5 and 6; the former applies to the velocity wheel, the blades being dovetailed into and accurately fitting a T-slot, while the "straddle" type is used for the disks, to which the blades are attached with rivets in double shear. The wheels are forced upon the shaft and driven by feather keys, the last wheel being fixed with a nut. The axial clearance between the blades and stationary parts varies from $\frac{1}{16}$ to $\frac{1}{8}$ in. (3 to 5 mm.).

FIG. 2.—LONGITUDINAL SECTION THROUGH WESTINGHOUSE-RATEAU H.P. IMPULSE TURBINE.

tinued in single stages until the exhaust pressure is reached, each stage consisting of a diaphragm fixed in the cylinder and a moving wheel on the shaft: the velocity acquired by the steam in expanding through the diaphragm nozzles is completely used up on the moving wheel. A section of the complete turbine is given in fig. 2.

There are usually three nozzle blocks, the number in use depending upon the load. The main governor is driven by a worm on the shaft between the main bearing and the registering or thrust block, the duty of which is not to resist end thrust, as there is none, but to maintain the shaft in its correct position with regard to the cylinder. The oil pump is driven from the main governor shaft. It will be noticed that one end of the cylinder is fixed to the bedplate, while the other is free to slide on a guide to allow of expansion; the transverse expansion of the cylinder is likewise provided for. The cylinder is of special cast-iron, strengthened with ribs, but the high-pressure nozzles are of wrought steel, machined all over. The diaphragms are cast in halves, as shown in fig. 3, with spigot and socket joints to prevent leakage of steam from one side to the other, and the respective halves in the upper and lower portions of the cylinder are not disturbed when the machine is

and the radial clearance between the tips of the revolving blades and the cylinder is never less than $\frac{1}{8}$ in. (6 mm.).

The shaft is of steel, stepped in diameter for each wheel, and is fitted with the Westinghouse water gland at each end, as well as with a labyrinth gland at the high-pressure end (where the pressure is about 20 lb. by gauge at full load): between the two glands at the high-pressure end is a connection to the exhaust space, so that both water glands are under identical conditions. They are absolutely air-tight, keep the bearings cool, prevent escape of steam into the engine room, and are perfectly self-adjusting under all conditions of load and vacuum.

The governor valve and overload valve are operated by an oil relay. The valves are of the balanced double-seated type, with self-aligning plates. The governor is of simple design, with provision for varying the speed whilst running, and an overspeed safety device is fitted on the end of the shaft, which trips the stop valve

FIG. 3.—SPLIT DIAPHRAGM.

FIG. 4.—DIAPHRAGMS IN POSITION IN HALF-CYLINDER.

opened: the outer periphery of each diaphragm fits in a groove in the cylinder, and the inner periphery is provided with special glands, which almost touch the shaft. The guide blades are of special steel, cast into the cast-iron diaphragms, or segmentally fixed to the diaphragms when cast-steel is used for the latter. The advantage of split diaphragms, with regard to accessibility, as compared with the practice of threading one-piece diaphragms on the shaft alternately with the blade wheels, is self-evident.

in case of excess of speed by releasing the oil pressure in the relay cylinder.

The bearings are usually of cast-iron lined with white metal and are provided with liners allowing the main spindle to be adjusted in any direction. A rigid shaft coupling is used for high-speed turbines, and a flexible type for low speeds, the latter consisting of two serrated heads engaging with a cylindrical sleeve, which can be slid to either side on removing a cover plate so that

either of the revolving elements can be removed without interfering with the other.

Exhaust, mixed-pressure, back-pressure, and reducing turbines are built on the same general lines, the design being varied to suit the conditions. Small turbines for driving electrical generators of 25 to 200-kw. output are also made, with a single two or three-row velocity wheel; these, it is said, can compete in price and efficiency with the high-speed steam or gas engine. They are extremely light, compact, and simple in construction, and find many useful applications.

Fig. 7 shows the arrangement of the steam-chest, over-speed trip gear, &c., of a high-pressure turbine.

Turning to the subject of alternators, there is no such choice of rival systems as in the case of turbines; practice tends towards

In small machines former-wound coils are used: one end is left open, to enable the coils to be pushed into the slots axially, after which the ends are connected together.

Fig. 9 shows in detail the method of clamping the end connections with wood blocks and metal bolts. Short-circuit tests at full voltage have been made in many different sizes of machines, demonstrating the ability of the winding to withstand the resulting stresses.

The rotor is the crux in the design of a turbo-alternator, owing to the necessity of perfect balancing at high speeds, ample strength, and adequate ventilation. The end windings in particular present difficulties in design, as they are often of considerable weight, and must be absolutely immovable. The Westinghouse Co. has adopted the smooth cylindrical type with radial slots, which lends itself to the easy anchoring of the winding, large output for size, good wave form, silent running, and facilities for ventila-

FIGS. 5 AND 6.—BLADING OF VELOCITY-COMPOUNDED AND IMPULSE WHEELS.

FIG. 7.—END VIEW OF WESTINGHOUSE-REATEAU H.P. IMPULSE TURBINE.

uniformity in the main design, and the differences between one and another make depend rather on details of design as regards methods of winding, ventilation, &c., than upon broad principles.

The Westinghouse turbo-alternator has a stator of the usual cylindrical type, consisting of steel punchings rigidly held in a substantial yoke, with air outlet chimneys at both top and bottom;

tion. The core is usually forged solid with the shaft, of high-class material; the coils are held in the slots by metal wedges, and the end connections are enclosed in steel or bronze end rings. The slots are wide and comparatively few in number, so that the end connections are substantial straps, from 1½ to 2 in. (38 to 51 mm.) wide in large machines, which resist deformation, even if the machine is short-circuited and the rotor brought to a sudden standstill. The blocking at the ends can therefore be reduced to a minimum, and the space utilised for ventilation. Fig. 10 shows a rotor partly wound, and fig. 11 the completed rotor.

FIG. 8. ARMATURE WINDING OF 5,000-KW., 11,000-VOLT 1,000-R.P.M. TURBO-ALTERNATOR.

FIG. 9. SECTION OF END WINDING, SHOWING METHOD OF CLAMPING.

either of these can be used for the discharge of heated air, which is preferably carried away by ducts to the exterior of the building, to ensure quieter running and a cooler engine room. The winding consists of separate bars and end connectors, which can be withdrawn independently for repairs; this system, as shown in fig. 8, allows of a solid bracing of the end connections, a most important matter, without interfering with the ventilation. The conductors are laminated to prevent eddy currents, and in large machines each conductor is insulated for the full voltage between the terminals.

In order to compress the winding and insulation to a practically solid condition, a clamping system consisting of heavy steel rings and radial screws is employed, as shown in fig. 12. By this means a pressure is applied to each coil approximately equivalent to the centrifugal force at full speed, amounting to from 50 to 100 tons per slot on the larger rotors. This high pressure, combined with baking at a high temperature, eliminates all possibility of "breathing" of the coils in service. Each coil is made in one piece without joints.

In turbo-alternators, which give a large output from a small volume of material, efficient ventilation is of supreme importance. In the smaller Westinghouse machines cold air is drawn into the casing by means of fans mounted on the ends of the rotor, and discharged through radial ducts in the stator. The larger machines are provided with the Westinghouse patent radial-axial system, according to which axial ducts carry air from both ends of the machine to radial ducts, from which it passes outward into the yoke (fig. 13). Local heating is prevented by causing the air to be

FIG. 10.—8,000-K.V.A., 2,400-R.P.M. ROTOR, IN COURSE OF WINDING.

FIG. 11.—COMPLETED 8,000-K.V.A. ROTOR.

discharged from the axial ducts over the whole length of the stator core, part of the air from each end being led the whole length of the core. Thus the advantages of uniform temperature and large volumes of air are combined.

The air enters the rotor by way of axial holes extending the whole length of the core, which feed radial ventilation ducts at

FIG. 12.—PRESSING GEAR IN POSITION ON 5,000-KW. ROTOR.

FIG. 13.—RADIAL-AXIAL SYSTEM OF VENTILATION.

intervals, the air passing across the air-gap and through the radial ducts in the stator core. Special care is taken to cool the rotor end connections, and all machines are made self-ventilating.

The exciter is usually overhung on an extension of the rotor shaft, and generally has a radial commutator, which eliminates the effects of vibration.

In conformity with British traditions, reliability and soundness of construction, combined with high efficiency, have been the fundamental considerations in the design of the Westinghouse turbines and alternators alike, and that success has been attained in respect of these will be admitted. Several machines of 23,500 K.V.A. have been or are being supplied to British power stations, and we have no doubt that larger sizes will be called for at no distant date.

ELECTRIC VEHICLES IN SHEFFIELD.

BY J. A. PRIESTLEY.

(Abstract of paper read before the INSTITUTE OF CLEANSING SUPERINTENDENTS.)

SHEFFIELD is easily the largest user of battery-operated vehicles for refuse collection, a purpose for which they are particularly suitable. In 1914, on the author's recommendation, the T.C. made extensive inquiries, and purchased an Edison 2-ton vehicle, which has been at work continuously since September, 1915. The results were so satisfactory that others were ordered, the number at work at the time of writing being eight, with two to follow. In order to facilitate comparison of costs, the author explains that the conditions relating to bin refuse collection in Sheffield are less favourable to the use of motors than in any other place known to him, but the opportunity of using the vehicles on both day and night service is a decided advantage. There are no back streets in the city; refuse collected during the day is carried from bins at the rear of the houses to the street by the workmen, the minimum distance being 20 yards. With horse wagons there are two men, who both help to load; with "electrics" there are three labourers, and a driver who only loads occasionally. The costs given below for bin refuse include all labour in collecting.

Ashpits are emptied by "getters-out," who are paid at piece rates, and wheel the refuse into the front street, where it is loaded into wagons, chiefly at night. Horse wagons are loaded by the driver alone, and electrics by the driver and one labourer. The costs in the case of ashpit refuse are for loading and removal only. The weekly wages at present paid are:—Electric vehicle drivers, 16s.; ditto labourers, 43s.; horsemen, 11s.; horse wagon labourers, 38s. The cost of horse, carter, and wagon is taken at 13s. 6d. a day, to which figure is added the wages paid for labourers.

The working costs of the "electrics" include wages, vehicle costs, tires, and electricity. The vehicle costs are as follows:—

Interest and depreciation (10 years' life) ...	£123	5	10
Insurance ...	8	10	0
Garage, cleaning, charging, and watering, ...	25	2	8
Waste, oil, grease, &c. ...	6	10	0
Repairs and renewals ...	13	2	0

£206 10 6

or £3 19s. 6d. per week, divided equally between day and night work. The tires are maintained under contract.

The batteries are guaranteed to give 100 per cent. of their original efficiency after eight years' constant service. The life of the electric vehicle is necessarily longer than that of a steam or petrol vehicle, with many working parts, and the strains and shocks which it endures are far less with the electric drive, while the allowance for repairs and renewals represents 10 per cent. on the cost of the chassis—an ample provision for 10 years' life. The total mileage per week is very low, and nearly one-half of this is run without load.

The period reviewed is comprised principally between March 26th, 1916, and March 25th, 1917, during which five electric vehicles were in use for different periods. In this year 51,499 tons of bin refuse were collected by horses at a cost of 65'4d. per ton, and 7,040½ tons by "electrics" at a cost of 57'8d. per ton. Of ashpit refuse, 27,878 tons were collected by horses at a cost of 44'5d. per ton, and 10,670 tons by "electrics" at a cost of 26'3d. per ton. The details of the costs of electric vehicles for bin refuse are:—

Vehicle costs, about 3½ years ...	£331	1	11
Drivers' and labourers' wages ...	1,230	9	8
Tires—12,640 miles at 1d. per mile ...	52	13	4
Electricity—19,639 units at 1d. per unit ...	81	16	7

£1,696 1 6

For ashpit refuse, the electric costs were:—

Vehicle costs, about 3½ years ...	£362	16	0
Drivers' and labourers' wages ...	641	5	11
Tires—15,313 miles at 1d. per mile ...	63	16	1
Electricity—24,716 units at 1d. per unit ...	102	19	8

£1,170 17 8

As the electrics, with one exception, were working on the longest distances, the comparison is not strictly fair to them. As the long-distance work is taken over from the horse wagons, the horse costs over the city area have decreased, while the electric costs remain at a maximum. In one ashpit district horses and an "electric" worked side by side, with the result that over a period of 23 weeks the average cost was: horses, 66'2d. per ton, and "electrics" 34'2d. per ton.

In addition to dealing with house refuse, the author has used electric vehicles for the removal of clinker residue from the destructor works to tips at a cost of 21'9d. per ton (or 16'4d. per ton-mile), compared with horse labour on the same work, 26d. per ton. On another route, removing clinker, the respective costs were 18'6d. per ton (18'1d. per ton-mile) and 21'6d. per ton; and on a longer route, 19'3d. per ton (11'7d. per ton-mile) and 26d. per ton.

The result of 12 months' working of electric vehicles in Sheffield considered on a financial basis alone is eminently satisfactory.

The work of the five vehicles for varying periods is equivalent to that of 3½ vehicles for the whole year: the saving over horse costs over the whole city amounts to £1,051; capital has been

written off to the amount of £293; electricity supplied from the destructors represents a further sum of £192, making a total of £1,535. Thus 3½ vehicles in one year have cleared off more than the initial cost of 1½ vehicles. If the comparison with horses were made only for the districts now served by the "electrics," the saving would amount to more than £2,000.

The author believes that "electrics" would also be profitable on single shifts only.

Average tons per day	horses	Bin. refuse.	Ashpit refuse.
.. .. .	electrics	3.42	3.63
..	7.67	10.58
Value of each electric in horses	5.15	

These figures relate to the whole city; the number of horses actually replaced by each electric is a fraction under six.

LEADS FOR ELECTRIC FURNACES.

BY PROF. ARVID LINDSTROM.

(Translated from *Teknisk Tidskrift in Metallurgical and Chemical Engineering*. Abstract.)

With the increasing size of arc or resistance furnaces the difficulties of conveying the current from the transformer to the furnace have become more pronounced. With electrode potentials as low as 50 and 100 volts the current necessarily will be very high, requiring in turn conductors of a large cross-section, and under such conditions two difficulties are met with.

One is due to the "skin effect," or the tendency of the alternating current to concentrate in the portion of the conductor nearest the surface; the other is due to the self-inductance of the conductor loop which connects the transformer with the furnace, resulting in a low power factor.

It is from the above two points of view that the problem of furnace conductors is dealt with in the following article, and an endeavour will be made to show how the best results may be attained when designing the leads, and also how the results may be investigated by tests. As an illustration, a known furnace installation will be taken for an example.

I.—THE EFFECTIVE RESISTANCE OF LARGE CONDUCTORS.

For round conductors Hospitalier has calculated a table for the ratio—

$$\frac{R_c}{R_d} = x = \frac{\text{effective resistance with alternating current}}{\text{resistance with direct current}}$$

as function of f and d , where f is the frequency, and d is the diameter of the conductor in cm. (1 cm. = 0.394 in.).

From this table the following values only will be given:—

$f d^2$	720.	1,280.	2,000.	2,880.	5,120.	8,000.
x	1.32.	1.68.	2.04.	2.39.	3.10.	3.79.

The furnace chosen for the example has a capacity of 900 kilovolt-amperes at the lowest pressure of 50 volts, so that the highest current is consequently 18,000 amperes. The frequency is 50. The conductors consist partly of four bars 200 × 15 mm., spaced comparatively close and connected in parallel. This corresponds to a cross-section of 120 sq. cm., or a round solid conductor with diameter $d = 12.4$ cm.; $f d^2 = 7,700$, and therefore $x = 3.7$.

It may be objected that the conductor did not consist of one single solid round conductor. This is true, but it must be remembered that even if the conductor is split, no gain is made if the spaces between the laminations do not take away any appreciable part of the section, and if instead of being round, the conductor had a rectangular or nearly square cross-section, of the same area, the conditions would not be much improved.

In our case, the four bars are arranged about as shown in fig. 1. The bars are spaced wider apart, and the average specific conductivity is consequently less, but not to such an extent that any

FIG. 1.

FIG. 2.

CONDUCTOR ARRANGEMENT.

appreciable decrease of x is obtained. At the same time as this specific conductivity has decreased, the linear dimensions of the cross-section have increased, and without introducing a too great error, it may be assumed that the resistance in this case is approximately three times as great for the 50-cycle alternating current as for direct current, or $x = 3$.

Now the question arises: How shall the conductors be arranged in order that a considerably better result may be obtained? The

first thing which suggests itself is the use of only one bar, not too thick, but much wider—a bar whose width is 20 to 50 times its thickness.

If h = half the thickness of the conductor in cm.,

$$c = 2 \pi \sqrt{\mu \lambda f}$$

where

μ = permeability of the material,
 λ = specific conductivity in C.G.S. units,
 f = frequency,

and x may be obtained directly from the curve in fig. 3. This is on the assumption that the width of the conductor is infinite in

FIG. 3.—DIAGRAM FOR FINDING x .

comparison to the thickness, an assumption which may be considered to apply approximately to our case. When—

$\lambda = 1/2,000$ for copper, $\mu = 1$ for copper, $f = 50$, then $c = 1$.

If now the thickness = $2h = 1.5, 2.0, 2.5$ cm.

then $ch = 0.75, 1.0, 1.25$.

and according to fig. 3, $x = 1.03, 1.09, 1.21$.

In all three cases, but especially in the first and second, a considerable reduction in the loss has been attained with the same weight of copper. We could use a conductor 500 × 8 mm., or only one-third of the originally assumed weight, and obtain the same loss as that now prevailing. Two-thirds of the installed copper could therefore be saved, and the temperature would certainly not be materially higher for this conductor than that of the four bars actually installed.

Even with a single bar 500 × 8 mm., a concentration of the current towards the edges must take place, so that a somewhat increased resistance will result. To avoid this, the conductor may be shaped as a pipe or tube, and if its diameter is fairly large as compared to the thickness of the walls, the calculation used for a bar of infinite width may be applied without appreciable error. With a thickness of 8 mm. the outside diameter of the tube would, therefore, be $500/\pi + 8 = 168$ mm., this being based on the assumed area of 4,000 mm.², which is one-third of that installed (12,000 mm.²).

Instead of an entirely closed tube, it can be separated into two halves as in fig. 2, but in the former case it is possible to provide for a very effective cooling inside the pipe.

II.—THE SELF-INDUCTANCE IN ELECTRIC FURNACE LEADS.

The connections between the transformer and the furnace are made as shown in fig. 4. The loop in which the self-induction takes place is a, b, c, d, e, a , and this should obviously be made as small as practical conditions will permit, consideration, of course, also being given to copper weight and energy loss. The distances

FIG. 4.—CONNECTION BETWEEN TRANSFORMER AND FURNACE.

bc and de are each, as a rule, approximately 3 m. at least. The question then arises, how can the self-induction in such a small loop, consisting of only one turn, reach such a value as to cause undue difficulties? The inductance L in itself is not large, but the voltage drop caused thereby, $E_s = 2 \pi f L I$, is considerable. This is naturally due to the large value of I , and the value seems particularly large when compared to the voltage of the furnace (50 to 100 volts).

By means of the following formula the self-inductance of a round conductor forming a circular loop, fig. 5, can be calculated :

$$L = 4 \pi R (0.58 + \log_e (R/r) - 2 r/R) 10^{-9} \text{ henry}$$

where R = the radius of the loop in cm.
 r = the radius of the conductor in cm.

If, in fig. 4,

$$bc = de = l = 300 \text{ cm.} \\ cd = be = l_1 = 400 \text{ cm.}$$

and if the rectangular arrangement is assumed to be changed to a circular one with the same circumference, its radius will be

$$R = (2 \times 300 + 2 \times 400)/2\pi = 220 \text{ cm.}$$

If we also assume that the leads are so heavy and so constructed that the radius of an equivalent tubular conductor is $r = 12$ cm., then the self-inductance will be

$$L = 0.934 \times 10^{-6} \text{ henry.}$$

With a current of 18,000 amperes we get

$$E_s = 53 \text{ volts.}$$

For a rectangular loop it is, however, possible approximately to deduce the self-inductance directly as follows : If the self-inductance for the two opposite parallel sides l is calculated in the usual manner and similarly for the two sides l_1 , it is evident that the total inductance of the loop will be approximately equal to the sum of the two, and thus

$$L = 4 (l \log_e (l/r) + l_1 \log_e (l_1/r)) 10^{-9} \text{ henry} = 0.934 \times 10^{-6}$$

—(accidentally) exactly the same value as before. This value is, however, too high on account of the fact that the entire side cd , which comprises the electrodes with their holders and the furnace itself, has a considerably greater cross-section (and consequently greater r) than the rest of the circuit. Taking this into consideration, and assuming

$$r_1 = 40 \text{ cm.,}$$

we get

$$L = 0.836 \times 10^{-6} \text{ henry,}$$

and

$$E_s = 47 \text{ volts.}$$

That part of the inductance which is caused by the magnetic field within the conductor itself has been neglected, but when, as previously stated, the current is concentrated near the surface, the error is not appreciable. On the other hand, it may be suspected that the value is too great on account of the fact that the side bc partly consists of cables which are spread out considerably, in

FIG. 5.

FIG. 6.

FIG. 7.

which case r , of course, is greater than assumed even for this part of the loop. Furthermore, these cables sag considerably, which makes the area of the loop less. On account of the many irregularities which the loop presents, it is evident that in general only an approximate result can be expected, and in this particular case we get possibly a somewhat too large value for the inductance.

III.—MEASUREMENT OF RESISTANCE AND INDUCTANCE IN FURNACE LEADS.

To measure exactly the effective resistance of the furnace leads in our case seems hardly possible. It is customary to measure the inductance by means of voltmeters, ammeters, and wattmeters connected on the primary side of the transformer, but this requires very accurate instruments.

The writer has used a more simple and direct method, consisting in measuring the inductive voltage component of the furnace leads directly with a voltmeter. A pressure wire was placed between the loop conductors, as shown by the dotted line in fig. 4, as well as in fig. 6, where the dot represents the relative position of the wire with respect to the copper bars. The potential between the ends f and g of this wire was determined by a hot-wire voltmeter, which is the only type which can be used within a reasonable distance from the leads on account of their strong magnetic field.

With the furnace in question, the following values were obtained :—

Current in furnace leads = 13,700 amperes.

Voltage at transformer terminals = 51 volts.

Voltage between f and g = 24 volts.

The current was measured on the primary side of the transformer, also with a hot-wire instrument.

The voltage triangle is as shown in fig. 7, so that

$$\cos \phi = 45/51 = 0.88.$$

If the current were 18,000 amperes and the total pressure of 51 volts were maintained, the voltage fg would be 31.5 volts, and the voltage triangle would give

$$\cos \phi = 40/51 = 0.785,$$

which value would apply for our circuit under full load.

One weakness of this measuring method is due to the difficulty in placing the pressure wire just right, in that it cannot, of course, pass centrally through the electrodes and the furnace itself. The inductance voltage will therefore be a little too low, but in any case it may be assumed that measurements with different arrangements of the leads are sufficiently accurate for comparisons.

This installation also contained some older furnaces, the leads of which consisted of copper tubing instead of bars. The leads were furthermore divided into two branches

(tubes) carried at some distance from each other. A pressure wire was placed inside one of the parallel pipes, and the following results were obtained :—

Current in furnace leads = 18,400 amperes.

Pressure at transformer terminals = 50 volts.

Pressure between f and g (fig. 4) = 22 volts.

$\cos \phi = 0.9$.

As $\cos \phi$ in the previous case for the same current was 0.785, it is seen that the older method gives considerably better results as far as the inductance is concerned. This depends partly on the fact that tubes are used instead of the laminated bars, but is principally due to the lead for each pole being divided into two separate tubes. In these tubes, as follows from the above, the increase in the resistance and the additional losses are considerably less than with laminated bars.

IV.—SUMMARY.

In those parts of the circuit between the transformer and the furnace where the two leads come near together (for example, between the terminals of the transformer and point a in fig. 4), there is no difficulty in keeping the inductance or the effective resistance within reasonable limits ; for example, by suitably transposing the positive and negative bars. In cases where the common distance is relatively great, much can be gained by making the leads of two concentric tubes. The inductance as well as the increase in the resistance will thus be a minimum.

In those parts of the circuit, on the other hand, where each lead has a separate path, the use of a single group of laminated bars for each lead would, in general, seem unsuitable, especially where large cross-sections are involved. As near as possible to the place where the leads separate, each conductor should be divided into two groups, placed sufficiently far apart with respect to the length. With a not too great current, each of these groups may consist of a single bar whose thickness should not exceed 15 to 20 mm. If the current is great, so that for practical reasons a total thickness of the bars for each group of more than 20 mm. would have to be used, tubes should be used instead of bars. Otherwise the arrangements should be as stated above—that is, two tubes for each lead should be used, placed at a suitable distance from each other and with a thickness of the walls from 15 to 20 mm. In general, a greater diameter of the tube (and consequently a less thickness of the walls) as well as a greater distance between the groups will give a better result with regard to the inductance as well as to the increased resistance.

LEGAL.

PRUST v. WESTMINSTER CORPORATION.

IN the Shoreditch County Court last Friday, before his Honour Judge Cluer and a jury, Mr. Prust, of Dalston Lane, N.E., a taxicab proprietor, sued the defendant Corporation for £34 damages to a taxicab. It appeared that at 11 o'clock, on a dark night, one of the plaintiff's cabs, while being driven along Knightsbridge, collided with another cab—a hansom—causing the damage. The alleged cause of the collision was that the Corporation had negligently allowed the electric light to go out at one standard, so that the plaintiff's driver was unable to discern his danger. He saw in front of him two red lights, which he took to be the danger signals put there in connection with an excavation in the roadway. He pulled to the right to avoid it, as he thought, and ran right into a cab which was coming in the opposite direction. As a fact, the red lights were those at the rear of stationary cabs on the rank. Had the electric light been on he would have seen what was happening and avoided any danger. It was argued by counsel that it was the duty of the Corporation to keep these lights going, and they would be responsible for anything that happened if they failed to do so.

For the defence, it was explained to the jury that at times, even though they used the very best of carbons, and took the greatest care, the carbon would fail to drop properly, and out would go the light. The electricity supply was carried out by the Westminster Electric Supply Corporation, who had three men constantly on duty to attend to these light failures. They knew the dangers in view of the darkened streets, and they had had to shade their lights to the required dimness ; besides which, they were even paying the police to give them information of any failure of light. On this occasion they were informed that the light had gone out, and sent as quickly as they possibly could, but unfortunately the accident occurred in the meantime. Counsel raised a number of points for the jury. Under the Defence of the Realm Act, it was an offence to leave a nuisance in the road, and the question was whether this could fairly be described as a nuisance under the circumstances. Again, there was the question whether the defendants had been negligent in having a standard where the light was liable to go out, at such a serious time as this, in the darkened streets. The jury found for the defendants, and judgment was entered accordingly, with costs.

RYAN v. L.C.C.

A SOUTH LONDON earman (G. Ryan) was awarded £350 damages, at the Southwark County Court, against the L.C.C. for personal injuries sustained through the wheel of his van catching in a defective tram-rail in Old Kent Road.

CONTROVERSY BETWEEN LONDON ELECTRIC LIGHTING COMPANIES.

At the Surveyors' Institution, Westminster, on Friday, Mr. JAMES SWINEBURNE, F.R.S., as Arbitrator, concluded the hearing of a claim by the Kensington & Knightsbridge Electric Lighting Co., Ltd., for damages against the Notting Hill Electric Light Co., Ltd., for an alleged breach of an agreement.

Mr. Vesey Knox, K.C., and Mr. H. B. Marriott were counsel for the claimants, while Mr. Honoratus Lloyd, K.C., and Mr. Bruce Thomas appeared for the respondents.

In opening, Mr. VESSEY KNOX said the question was whether the taking of a supply of electrical energy in bulk from the Metropolitan Supply Co., Ltd., and the Hammersmith Borough Council by the Notting Hill Electric Light Co. was a breach of an agreement made in 1909 with the Kensington Co.

Mr. HONORATUS LLOYD: I don't accept that. The point I venture to think we have to discuss is in relation to Kensal Town, and not Hammersmith. Kensal Town is the one we referred to the Arbitrator. Hammersmith has cropped up afterwards.

Mr. VESSEY KNOX said he thought he should be able to satisfy the Arbitrator that the question of the Hammersmith supply should be included. Proceeding, counsel said that in July, 1899, the claimants and respondents (both of whom had statutory powers to supply electrical energy in Kensington) agreed jointly to promote a Bill in Parliament for the purpose of enabling them to acquire land near Wood Lane, Hammersmith, and erect a generating station thereon. It was agreed that the joint station should be constructed with a generating plant of a total power of 1,800,000 watts continuously, and that this output might be used by the parties as they might require, but the claimants were not to be entitled to use more than 1,200,000 watts, and the respondents not more than 600,000 watts, without the consent in writing of the other, and any lesser output was to be available in accordance with the proportions above mentioned. Another clause of the agreement provided that the parties should bear the expense of working, maintaining, and repairing the joint station, and of outgoings and interest on the joint loan by means of a sinking fund, or otherwise rateably in proportion to the amounts of electrical energy taken by the parties respectively from the joint station. The Bill was passed, and by an agreement dated October 25th, 1900, it was agreed that the station should be constructed and equipped by the two companies by means of an issue of debenture stock of a nominal amount not exceeding £200,000, to be secured by a trust deed. Another clause—the one under which the Kensington Co. now claimed—provided:—

"That so long as any of the said stock shall be outstanding the two companies shall from time to time take from the joint station all such electrical energy as each company, having regard to its other sources of supply, may require for the purposes of its business in accordance with the provisions of the agreement of 1899, or such other provisions as may from time to time be agreed upon between the two companies or settled unanimously by the Committee of Management."

The trustees for the debenture-holders (said counsel) were obviously not satisfied to lend their money unless the principal agreement was strengthened in that manner. It was further provided that the property, after the redemption of the stock, should belong to the claimants and the respondents in the proportions to which they should be entitled, as tenants in common, in such shares as should be in proportion to the amounts of their respective contributions. The respondents had in 1909, and since, taken a supply of electrical energy in bulk from the Metropolitan Electric Supply Co., Ltd., and they had also taken a supply from the Hammersmith Borough Council. Claimants submitted that the Notting Hill Co. had thus committed a breach of their agreement. As a consequence, the expenses of the joint station to be paid by the claimants were increased to the extent of £1,650 from 1909 to the end of 1915. The figures for 1916 had yet to be supplied by the respondents. The Kensington and Knightsbridge Co. accordingly claimed damages, and a declaration that the respondents were bound to take electrical energy in accordance with the agreement. The respondents, in their defence, denied any breach of the agreement, and declared that the claimants expressly or impliedly requested them to take, or so agreed to them taking, the supply from the Metropolitan Co., and to waive such breach, if any. Respondents further stated that they relied upon the following circumstances:—"In 1907 certain parties in the Borough of Kensington, outside the areas of supply of both the claimants and respondents, being anxious to obtain a supply of electricity, representatives of the two companies met and discussed the question of such supply being given by the respondents. The parties in question were Messrs. W. N. Davis & Son, of Kensal Dye Works, South Row, Upper Westbourne Park, W. As a result of the discussions, it was determined that the respondents, not being able to give the supply themselves, should arrange for it to be provided by the Metropolitan Supply Co., Ltd. The respondents accordingly made such arrangements and obtained authority from the Board of Trade to give the supply. The decisions referred to were made at one of the weekly meetings which took place during July, 1907, at which the claimants were represented by their then secretary (Mr. Erskine), and the respondents by their

secretary (Mr. Rawkins) and their chief engineer and manager (Mr. G. Schultz), and had been acted upon ever since with the full knowledge of the claimants. Since Messrs. Davis & Son were first given a supply of electricity, other parties outside the respondents' area of supply had been supplied in the same manner, and the claimants had been at all times aware of it, and had acquiesced therein. These other parties included a L.C.C. school in Middle Row; the London General Omnibus Co.; Middle Row Garage; William Whiteley, Ltd., 222, Kensal Road; Globe Wernicke, Ltd., Kensal Road; and the Roman Catholic Schools, Bosworth Road. In the further alternative, if the supply in question was a breach of the agreement, the respondents contended that it was authorised by the London Electric Supply Act, 1908. They further submitted that they had at all times taken such a proportion of the output of the joint station as was reasonable, and, in the alternative, if the supply was not in compliance with the agreement, that the claimants were not entitled to any payment or to claim any damage in respect of any period prior to the date when the claimants first represented to the Committee of Management that the respondents were not taking such a proportion of the output of the joint station as was reasonable."

Proceeding, Mr. Vesey Knox said it was not till 1916 that the directors of the Kensington Co. had any knowledge of any supply being taken by the respondents from the Metropolitan Co. They immediately made a complaint, and as it had not been met they brought the matter before the Arbitrator. Counsel said it was apparent on the score of cost that the respondents had a strong motive for taking the supply from the Metropolitan Co. and not from the joint station.

Mr. HONORATUS LLOYD observed that the Metropolitan Co. laid the mains, and the Notting Hill Co. paid for them.

Mr. VESSEY KNOX: If the Metropolitan Co. laid the mains they broke the law. The Notting Hill Co. have got the power to break up streets by these "fringe" orders.

The Arbitrator inquired when the Hammersmith supply began.

Mr. LLOYD: In 1906, sir.

Mr. VESSEY KNOX (glancing at a document): It says 1908 here. It must have been trifling in 1906.

Mr. LLOYD: It has always been trifling. It would affect the Wood Lane account in respect of your supply not more than £5 a year.

Mr. VESSEY KNOX, continuing, submitted that it was clear that the supplying of various customers under the "fringe" orders by the Notting Hill Co. was part of their business. It was true that the annual accounts of the respondent company were sent to the claimants, because it was the custom of the London electric light companies to exchange accounts, but the directors did not notice that those accounts contained year by year an item of "Electricity purchased from other sources."

The first witness was Mr. HERBERT WOODFIELD MILLER, who said he had been managing director of the Kensington Co. since April, 1914, and that prior to that for some 20 years he was the chief engineer. Mr. Erskine was the secretary of the company during his (Mr. Miller's) association with it to June, 1913, when he died. During that time witness was practically in daily communication with Mr. Erskine, who never mentioned a word about any such arrangement as that alleged by the respondents. Witness had searched through Mr. Erskine's papers, and had not been able to find a single document or note relating to the alleged arrangement. Towards the end of 1914 Mr. Rawkins told him the respondents were going to enter into an arrangement with the Omnibus Co., that it would be a good stroke of business, and that the supply would be given by the Metropolitan Co. Prior to that he had no knowledge or notice that they were getting a supply from the Metropolitan Co.

Col. CROMPTON, C.B., a director of the claimant company since 1901, and chairman of the board of directors since 1903, said that if Mr. Erskine had mentioned anything to him about the respondents being supplied by the Metropolitan Co. he should have objected very strongly.

Sir HENRY BLOSS, a director of the Kensington and Knightsbridge Co., said that until Mr. Miller brought the matter before the board of directors on March 30th, 1916, it had never come before the directors in any shape or form.

Mr. G. S. BARTON, secretary of the Kensington Co., who succeeded Mr. Erskine, also gave evidence.

This was the case for the claimants.

Mr. HONORATUS LLOYD, for the respondents, said he began by protesting against the inclusion of the Hammersmith matter, and he adhered to that. The question arose with reference to two groups of consumers, one in Kensal Town and the other in Hammersmith. So far as the Kensal Town customers were concerned, they had never been in the area of the respondent company, and were not within their area now, and the respondents had no right to supply them or lay a main or anything else until after 1910, when they obtained some "fringe" orders. In Hammersmith the customers, originally 14 in number, now numbered four—at any rate, four had now come into the area upon the recasting of the boundaries. It was admitted that at the time of the agreement the respondents had one source of supply, which was their own generating station, and that this was sufficient to have supplied both the customers at Kensal Town and Hammersmith. Therefore, he submitted, under the agree-

ment, having a source of supply which was ample, the company was not obliged to take the supply from the joint station. If he was right in that construction of the clause in the agreement there was an end of the whole case. With reference to Kensal Town, it was not legal for the respondents to supply the consumers until the "fringe" orders were obtained. It had been said by his learned friend that Kensal Town came within the respondents' business. He (Mr. Lloyd) submitted that it must be a legal business, one they were entitled to carry on, and until the "fringe" orders it was an illegal business, and, as such, certainly could not be business which would come under the agreement. Regarding the position when the business became legalised, counsel quoted from the Act of Parliament sanctioning the erection of the joint station with the object of showing that it was "for the purpose of supply within the respective areas of supply" of the two companies, and to certain specified bodies—the Vestry of St. Mary Abbots, Kensington, and Hammersmith for the White City.

THE ARBITRATOR: Do you contend that the joint station is not even now available for supplying under the "fringe" orders?

MR. LLOYD: I do. Although I submit that the decision of the company has been legalised by the "fringe" orders, it has not enabled the supply to be given from the joint station for that purpose. Those are a few points of law I submit to you. Counsel went on to refer to the respondents' submission that the taking of the supply from the Metropolitan Co. was known and consented to by the claimants. In 1907, when they had an isolated request from Kensal Town Dye Works, who threatened them with the Board of Trade, they thought at the time those works were in their district, and that occasioned more worry still. Mr. Rawkins had interviews with Mr. Erskine, and the latter agreed that it was the wisest and best thing to give this one customer a supply. As time went on other customers came in, and Mr. Rawkins used to tell Mr. Erskine the price he was getting. The real point was that that was done as a perfectly reasonable thing, having regard to economic considerations. It was admitted that it would have been an uneconomical thing for the respondents to have supplied the customers direct from their own generating station because of the distance, and what was done was done with the knowledge and acquiescence of Mr. Erskine.

THE ARBITRATOR: The question is having done it, and received benefit, have the other side any right to part of that benefit? That is a legal question. The other question is economy—whether it would have been wise in the circumstances to take it on at all if you had had to do it yourselves. I appreciate your argument that the joint station still has no power to supply it. That, of course, stands out by itself. It has nothing to do with the other points.

MR. LLOYD submitted, lastly, that even if he was wrong in law and fact, the claimants had suffered no damage.

Evidence was then given in support of counsel's statement by **MR. RAWKINS**, who said he had been secretary of the Notting Hill Co. since 1903, and manager and secretary since 1913. **MR. ERSKINE** quite agreed that he should go to the Metropolitan Co., and upon the report of **MR. SCHULTZ** (who was manager and chief engineer up to 1913, and who since then had been consulting engineer), the directors determined to make arrangements to obtain the supply from the Metropolitan Co. On the report of **MR. SCHULTZ**, the respondents would not have supplied this had it not been possible to obtain a supply from the Metropolitan Co.

MR. SCHULTZ and **MR. MACDONALD** also gave evidence for the respondents, as well as **MR. SPARKS**, the President of the Institution of Electrical Engineers, whose testimony was of a technical character, dealing with economic considerations.

It appeared that the claimants had based the amount of their claim on figures supplied by the respondents of the quantities of electric energy purchased by them from other sources. The figures included a certain quantity supplied by the Hammersmith Borough Council. While not agreeing to the inclusion of the Hammersmith matter in the case, **MR. LLOYD** consented to the figures being included, and learned counsel on both sides agreed that for the purposes of the case the damages should be put at £1,900 up to 1916.

MR. VESSEY KNOX remarked that the primary object of the claimants was to get the agreement construed, although they did not know of the supply by the Hammersmith Council until respondents sent them the figures.

MR. LLOYD: It would be hard if you were found to be right over Hammersmith, and we had to pay all the cost when it is not in the reference.

THE ARBITRATOR pointed out that the costs were within his discretion, and observed that if he found that the Hammersmith question was not before him he could wipe it out.

At the conclusion, the **ARBITRATOR** intimated that he would state his award in the form of a special case, but in view of the Long Vacation there was no immediate hurry.

ELECTRICITY SUPPLY TARIFFS.

THE HACKNEY CASE.

The hearing of this case was commenced in the Chancery Division on Tuesday last. It will be reported in later issues.

WAR ITEMS.

More Appreciation from the Forces.—A Lieutenant with the Tyne Electrical Engineers, R.E., writes:

"The letter from a lance-corporal in the L.E.E. which appeared in this week's REVIEW awakens me to my sense of duty, and a very pleasing one it is. Unless one has actually been to all intents and purposes completely isolated from the outside and commercial world, it were impossible to realise the help and benefit derived from the good old ELECTRICAL REVIEW received each week. Although never in the same place for more than a few days at a time, I always receive the welcome copy from my central address, and I quite agree with our L.E.E. friend that without your weekly gift we should be out of the times to such an extent that in the better days to come we might find ourselves permanently handicapped. I'm sure there are many who would echo these sentiments, and were it not for military pressure of duties you would weekly be inundated with budgets of appreciative correspondence. Perhaps our occasional slackness in writing is due to the fact that we now consider the weekly advent of the ELECTRICAL REVIEW in the nature of a priceless institution. Be that as it may, you are undoubtedly doing the industry one of the best of modern services, and the thanks of the profession are due to you accordingly. May you continue to prosper and carry on the good work till the old times come again, when I doubt not but what your reward will be superabundantly fulfilled."

Leaving Certificates.—A protest was made at the meeting of the Radehill (Lanes.) Urban District Council last week against the decision of the Electricity Committee, by five votes to two, to refuse a leaving certificate to the second engineer, **COUN. ATHERTON** said the certificate should have been granted. It had not been granted because the applicant happened to be a working man who desired to improve his position. The Committee's decision would probably have been different had it been an official who had obtained promotion. He knew there was a scarcity of labour, but other undertakings were similarly situated. **COUN. LORD**, the chairman of the Committee, said the engineer was away when the Committee met, and the matter was really deferred so that he could be present to state his case. Several members asked if the position at Birmingham was still open, and the chairman replied in the negative. A member: Then he has lost his chance. The Council referred the minute back, **COUN. BROOKS** saying it amounted to a censure upon the Committee. **COUN. WHWELL** said the man could have applied to the Board of Munitions for a leaving certificate, but unfortunately he did not take that course.

After the War.—Speaking at the annual meeting of Messrs. J. Tylor & Sons, **MR. PHILIP BRIGHT** referred to the subject of Labour conditions after the war. As reported in the *Financial Times*, he said:—

"About two months ago we, in common with almost all other engineering firms, had a strike, which lasted more than a week and affected the month's output considerably. The causes were at the time obscure, but I have recently been investigating them, as one of the Commissioners appointed by the Government to look into the question of industrial unrest in the North-East area. Our report is now in the hands of the Government, and I hope that steps may be taken to remove any grievances which may have been found to exist. Personally, I am strongly of opinion that if the workman can be persuaded to increase his output and to utilise to the fullest extent every appliance which science, allied with capital, can provide, capital can and must afford him a more liberal reward in return for his labour and a reduction of working hours to permit him to enjoy the greater leisure and recreation which will be his due. The majority of employers and workmen are coming to regard conditions of employment from a more reasonable standpoint than they did in the past, and they ought to combine to influence the extremists of both classes who resist the introduction of methods which, if properly applied, must tend to improve the relations between Capital and Labour. Deliberate restriction of output, as now widely practised, is wholly indefensible, but it has been encouraged in the past by some employers who regarded large earnings on the part of workmen with suspicion and disapproval. In America wages are much higher than they are here, and the output per man is enormously greater, and it is in that direction that we must travel if the wealth which has been so wantonly destroyed during three years of war is to be restored. It is now generally recognised that all the pre-war conditions which existed in engineering workshops cannot be restored without a very serious loss of efficiency; indeed, such restoration would be as retrograde a step as the suppression of motor traction in favour of horses. We must, however, bear in mind that the Government is definitely pledged to such restoration, and we are in honour bound to see that Labour is in no way prejudiced if it loyally accepts—as I believe it will—a reasonable modification of that undertaking."

MR. ANDREW FISHER, High Commissioner for Australia, addressing businessmen in Belfast recently, said that after the war approximately two years would be occupied in returning to the Dominions the men who had come to fight the

enemy. That meant that a certain amount of shipping would be utilised, and that to a large extent the productive services of these men would be lost during that period, while all the time the Germans would be making goods for us unless we put up our hands now and told them that they could not come in. We had the men, the initiative, and the enterprise to found new businesses, but Government help must be guaranteed. He, for one, hoped that Free Trade as it was known before the war would never rear its head again.—*Daily Telegraph*.

Mr. J. L. Garvin, speaking to the United Workers, at Burlington House, said it was the sheerest moonshine madness to imagine that the problems of peace might be left till peace was declared, and that all our efforts should now be concentrated on the war. The nation which could demobilise most speedily would secure an enormous advantage which it would be difficult to overtake. Britain would have to demobilise by ships, and the Continental Powers, fighting on their own territories, by rail. Germany had perfected her railways, while we had torn our lines up. We had a diminished fleet, and must leave large numbers of our workers abroad while we carried to their homes the Colonial and American soldiers, and this with a sadly diminished fleet. We had to find work for 8,000,000 persons, and build, at the smallest computation, 150,000 houses with a lack of raw material for the purpose. France and Belgium could not wait for their rebuilding, but must take the first comers. It was the most imperative and urgent problem Great Britain ever had to face. The first desideratum was the compilation of a national register with a record of all the soldiers and munition workers and the available stock of machinery. Disaster would certainly come from Labour difficulties unless Capital and Labour could come to a common agreement for the production of a new industrial charter. A career must be offered to the worker, who should not be allowed to drift from employer to employer, and there must be some return to the older and more kindly social relations. Larger social ambitions must be excited and gratified for him.—*Daily Telegraph*.

Mr. George Lansbury, writing to the Stepney and Poplar Federation of the Church of England Men's Society on Labour problems after the war, said: "It is no use thinking of reorganisation merely for the purpose of more money-making. We must recognise the value of a thing not by its cost, but its utility. We have degraded Labour and ourselves by putting money value on all our services. Most of us have lived long enough to know that we cannot put a gold value on the things we most care for. Therefore, Labour and Capital must come together on a co-operative basis—Labour giving its industry, organised into industries or guilds, and Capital giving its brains, both as parts of the great business of co-operative production and distribution."—*Daily Telegraph*.

The *Times* reports a speech delivered by Lord Leverhulme at the Aldwych Club luncheon last week on after-the-war problems. We quote the following therefrom:—

"In what way, asked Lord Leverhulme, were we to make the best of our position? The present antagonism between Capital and Labour ought not to exist. Capital and Labour must be fused into one. Co-partnership was the one basis of commercialism; but it must not degenerate into charity or philanthropy. Its object must be increased efficiency and increased prosperity for all; and it must maintain supremacy of management, and Labour must be free to work out its own ideals; and there must be greater stability in the arrangement than a mere cash bonus. Further, the benefit must extend to wives and children—he attached the utmost importance to this—and a man must know that his share in co-partnership would on his death go to his widow during her widowhood. This benefit would elevate management and labour equally in the social scale, and would not be antagonistic to the legitimate rights of workers. Control must rest with those who found the cash capital. If we had co-partnership on these lines there would always be the underlying wages system. This must be maintained on the highest scale practicable to the industry concerned. The bulk of production was done by machinery, which was getting more and more complicated and costly every day. Would it not be better, instead of running it eight hours a day, to have two shifts of six hours each? With such a reduction in hours, and there would be an enormous national gain. The days lost through illness would be decreased by 25 per cent., and the breakdown of machinery would also be reduced. This was the outline of the vision he had of meeting the conditions that he thought would arise after the war. The greatest stimulus required was profit-sharing, which would humanise industry and make the working man no longer antagonistic to the capitalist, because he himself would be a capitalist."

Trade After the War.—Lord Balfour of Burleigh's Committee on the question of Trade After the War met at the House of Lords last week, when important evidence was taken.

Exemption Applications. At the Shoreditch Tribunal, Mr. J. Perg, aged 34 years, of 169, City Road, E.C., electrical engineer and scientific instrument maker, made a third application for exemption. He said he was carrying out a lot of electrical work for instruments in connection with the war.

He was a Russian Pole. The Tribunal granted one month, final.

At Maidstone, Mr. O. Jones, electrical engineer, appealed for E. Wicks (28) and W. H. Brown (37), employed on electrical plant at local works and institutions. Each was allowed three months.

Sheffield Tribunal has granted exemption until December 31st to C. West (37, Class C3), electrician, appealed for by the Lyceum Theatre, Ltd.

Hitchin Rural Tribunal has given six months' exemption to E. A. Bindell (22, Class B3), electrical engineer to Mr. Marlborough Pryor. He was discharged from the Household Cavalry in consequence of a dislocated knee.

At Bexhill-on-Sea, on the appeal of Mr. Baker, of Station Road, six months' conditional exemption was granted to E. W. Climpson (B1), electrician.

With the assent of the military, exemption whilst engaged in the same trade has been granted to A. T. Clarke (33, Class C3), electrician, Weymouth.

Hastings Tribunal has granted three months' exemption to J. P. Murray (31, B2), fitter's mate, and N. W. J. Bissenden (22, B3), wireman, appealed for by the Tramway Co.; six months to C. Gower (39, C2), tramway motorman; and conditional exemption without time limit to J. C. Sweatman (35, C3), electrician.

At Brierley Hill, Messrs. Holmes & Cartwright appealed for their electrical engineer and fitter (27, B1), said to be the only electrician left in the town. Three months were granted.

At Accrington Tribunal, application was made on behalf of six tram drivers for leave to bring their appeals before the Tribunal. The men ranged from 35 to 38 years of age. One half were Class A men and the other half were Class B. The Military Representative said he had gone into these cases along with the tramway manager, and they came to an agreement after making allowances for other men. It was too late in the day to re-open the cases. Mr. Britcliffe suggested that if the men had to go into the Army some of the tramcars would have to stop. The Tribunal refused to re-open the cases, with the exception of a B2 man, who could have a fresh examination. If, however, he was returned in the same category he would have to go with the rest into the Army.

BUSINESS NOTES.

Commercial Intelligence Work of the Board of Trade.

—At a meeting of the Advisory Committee of the Board of Trade on Commercial Intelligence on July 4th a report was presented for the quarter ended June 30th, 1917. According to the *Board of Trade Journal*, among the other matters considered by the Committee were the future organisation and scope of the British Industries Fair; co-operation of the Board of Trade with trade associations in the investigation of foreign markets; the revised instructions to Trade Commissioners; the commercial mission now in progress in Spain; and proposals for the formation of a Latin-American Association.

Japanese Electrical Exports to China.—According to a recent official report, Japanese electrical materials are being imported in considerable quantities into the Upper Yangtze district of China.

Book Notices.—*Farming by Motor.* London: Temple Press, Ltd. Price 1s. 6d. net.—This interesting booklet briefly summarises the leading particulars of about 20 types of farm tractors and motor ploughs, and illustrates and describes the work which they may be expected to perform. It is intended as an aid to the farmer in securing the machine best suited to his own conditions, and, needless to say, its sponsors, the *Motor and Commercial Motor*, have made the most of a pet subject in the limited space at their disposal. The book would be much increased in value by the addition of actual data as to cost of operating different machines under varying conditions of practical farm work; and the farmer would probably prefer to be warned of the possible defects of new implements rather than find them out by personal experience or trial. But if we admit certain shortcomings inherent in new appliances, the oil-driven farm implement is still one of the best means of labour-saving, and, as such, should be encouraged in every possible way.

"Technical Papers of the Bureau of Standards." No. 90. Structure of the Coating on Tinned Sheet Copper in Relation to a Specific Case of Corrosion. No. 91. Temperature Measurements in Bessemer and Open-hearth Practice. Washington: Bureau of Standards, Department of Commerce.

Catalogues and Lists.—BRITISH THOMSON-HOUSTON Co., LTD., Rugby. List No. 4,160 (20 pages) contains full description, with many illustrations, connection diagrams, and tabulated particulars, of the company's ironclad draw-out oil-break switch-gear (type O, forms J₁ and J₂).

THE KLAXON CO., LTD., 1, King Street, St. James', London, S.W. 1. Small booklet of 24 pages, giving illustrations of a few of the purposes for which their Klaxon warning signals are suitable.

Liquidation.—RURAL DISTRICTS ELECTRIC UNDERTAKINGS, LTD.—Winding-up voluntarily. Liquidator: G. W. Brown, 24, Martin's Lane, Cannon Street, London.

LIGHTING AND POWER NOTES.

Bradford.—B. OF T. ELECTRICAL SUPPLY COMMITTEE.

—The Corporation Electricity Committee has passed a resolution fully endorsing and supporting the action taken by the Hammersmith Electricity Committee in suggesting that Electricity Committees should combine to demand that the B. of T. Committee should be dissolved, and replaced by competent, unbiased persons not directly interested in electrical matters.

The Electricity Committee has decided to provide a special coal siding on the Midland Railway at Canal Road, and to install conveyors between the siding and the electricity works as soon as authority for the work can be obtained.

Bury St. Edmund's.—YEAR'S WORKING.

—The borough electrical engineer's report on the working of the electricity department for the year ended March 31st last, shows that the units sold amounted to 281,507, as compared with 302,680 in 1916. The total income was £1,875, and working expenses £3,828, leaving a gross profit of £1,046; after meeting interest and sinking fund charges and other expenses, there is a deficit on the year's working of £1,037. The cost per unit sold has risen from 234d. to 315d.

Canada.—ONTARIO POWER CO. PURCHASE.

—By the purchase of the generating plant of the Ontario Power Co., Niagara Falls, Ont., the Hydro-Electric Power Commission of Ontario have acquired the largest generating plant in Canada. The capacity of this plant is in the neighbourhood of 175,000 H.P.

The arrangement, briefly, amounts to the assumption by the Ontario Government of a bond of issue of \$14,699,000, the payment by 1 per cent. 40-year debentures at 80 per cent. of its par value for \$10,000,000 of capital stock, and the assumption of all Canadian and United States contracts. The financial obligation thus amounts to \$22,669,000, on the supposition that all the common stock is turned in, and the contracts include the Commission's own contract for 100,000 H.P., as well as a contract with the Ontario Transmission Co., which distributes throughout the Niagara Peninsula, for 60,000 H.P. There is also assumed a contract for the supply of 60,000 H.P. on the United States side of the line. It will thus be seen that the Ontario Power Co. held contracts for supplying up to 220,000 H.P., which necessitated the purchase of a considerable quantity of power. This, by an old agreement, is being obtained from the Electrical Development Co. The agreement for the supply of 60,000 H.P. to the United States terminates in 1950; the price received is \$12.50 per H.P. The United States company owns its own distribution system.

The Ontario Commission is, therefore, distributing at the present time in the neighbourhood of 300,000 H.P. This is made up chiefly of the 220,000 H.P. obligation assumed from the Ontario Power Co., 50,000 H.P. purchased from the Canadian Niagara Power Co., the generating plant at Eugenia, the Severn River plants, and the numerous developments recently taken over in Central Ontario from the Electric Power Co.—*Canadian Electrical News*.

The Shawinigan Water and Power Co. is constructing a 100,000-volt transmission across the St. Lawrence River. This will take the form of a 5,000-ft. span of three steel cables carried on towers 350 ft. high, which will rest on concrete piers in the river. The cable supports on the towers are on the same level but 50 ft. apart; the cables are to be brought down behind the towers and anchored. The spans will require to be insulated at either end, and the insulators will, in addition to the electrical stress, have to withstand a mechanical stress of above 150,000 lb. each.

Continental.—PORTUGAL.

—A Bill has recently been introduced into the Portuguese Chamber of Deputies, under which it is proposed to grant State assistance towards the establishment of new industries and the development of existing ones in the country. Among the undertakings which it is proposed shall come within the scheme are:—The utilisation of available water power and the manufacture of electrical material and electro-chemical products.

SPAIN.—Application has been made by Julian Hernandez, of Santa Cruz del Valle, for a concession to establish a generating station and erect transmission lines for the supply of electric energy to Santa Cruz del Valle, Soto Garganchon, and Valmala.

ITALY.—The Società Generale Italiana Edison di Elettricità has published the conditions of a prize competition for an electric kitchen to serve a family of five or six persons, which it has established. Ten thousand lire have been set apart for the prizes, up to three in number. Five judges have been nominated—namely, one member each from the Milan Royal Technical Institute, the Associazione Elettrotecnica Italiana, the Associazione Escenti Imprese Elettriche, the Lega Economica Nazionale, and the Società Edison.—*Elettrotecnica*.

Chippenham.

—The U.D.C. has decided to have the electric light installed at its offices.

Crosby.

—The P.C. has appointed a deputation to confer with the Scunthorpe U.D.C. relative to the latter's application for a prov. order for electric supply in the parish, and to which the Council is favourably disposed.

Darton.

—The U.D.C. has sanctioned the application of the Yorkshire Electric Power Co. to erect an overhead line from its power station at Barugh to Gawber.

Dover.

—The T.C. has decided to extend the mains so as to supply current to a local hospital. The Post Office having taken only 9,989 units instead of 12,000, the guaranteed minimum, the

T.C. has asked the department to pay 4½d. per unit for 10,000 units, instead of 4½d. and 4½d. per unit beyond, as originally agreed.

Exeter.—YEAR'S WORKING.

—The annual report of the city electrical engineer (Mr. H. D. Munro) states that the accounts of the undertaking for the twentieth completed year of working show a gross surplus of £9,789, as against £7,719 in the previous year, and a net surplus, after meeting interest, sinking fund, and income-tax charges, of £2,043. A total of 1,972,288 units were sold, a net increase of 207,065. The loss of revenue by reduced public lighting is made good by an increase in the tramway supply. Allowing for stock differences, the actual consumption of coal has been further reduced by 200 tons, in spite of the increased output, and the Committee has been able to effect economies in nearly every other item of the expenditure account. As a result, the overall cost of production per unit has been brought down by nearly 12 per cent., in spite of the enhanced cost of all materials. The number of consumers has increased by only 55 during the year, owing to the difficulty of obtaining cable for connections, but 15 of these were for power supply, of which an additional 110 H.P. has been connected.

Greasbro'.—PROV. ORDER.

—The U.D.C. has considered the notice dated June 8th, 1917, of the intention of the Rotherham Corporation to apply for a prov. order to supply electricity within the district, and has decided not to assent to the proposals. The Council intends to apply for a prov. order itself, and the Rotherham Corporation is to be asked for its terms for a bulk supply, so that the Council will be able to supply to consumers at rates not higher than those charged within the borough.

Halifax.

—Yesterday a new 6,000-KW. turbo-generator was to be officially started-up at the Corporation electricity works, Lady Rhondda having consented to perform the ceremony.

Hucknall Torkard.—PROVISIONAL ORDER.

—The U.D.C. is to oppose an application by the Nottingham T.C. for a provisional order for electric supply, as the Sherwood Colliery Co. has already offered a supply of current after the war.

Itchen (Hants).—PROPOSED BULK SUPPLY.

—The U.D.C. has appointed a Committee to discuss the question of obtaining electricity in bulk for distribution in the district.

Kirkby-in-Ashfield.—E.L. PROPOSALS.

—The U.D.C. has decided to call a special meeting to discuss the application of the Nottingham T.C. for a provisional order for electric supply.

Kirkcaldy.

—The T.C. having been refused permission to borrow £27,000 for extensions at the electricity works, has decided to apply for powers to borrow £7,000 for a high-pressure cable from the generating station to the Pathhead district.—*Glasgow Record*.

London.—L.C.C.

—The Finance Committee has, with the Council's sanction and with the approval of the Treasury, agreed to advance on loan £9,185 at 5½ per cent. to the Hackney B.C. for electricity purposes.

STOKE NEWINGTON.

—The Electric Lighting Committee reports that in view of the probable shortage of coal supplies during the coming winter, it has had under consideration the charges for domestic heating, which are at present 4½d. per unit for the first hour's daily use of the maximum demand, and 1d. per unit for all further consumption. As an alternative, the Committee recommends that a flat rate of 2d. per unit be offered for domestic heating, cooking, &c., to all lighting consumers.

SHOREDITCH.—WHISTON STREET EXTENSION.

—The revised estimate of the total cost of the proposed extension totals £51,500, as against £41,000 for which sanction has been obtained. The Electricity Committee recommends that application be made to the L.C.C. for sanction to a further loan of £10,500 necessary owing to the rise in prices consequent on war conditions since the original estimate was prepared; and that the L.C.C. be requested to consider the granting of the longest possible terms for the same and the lowest rate of interest.

HAMMERSMITH.

—The Electricity Committee has received a letter from the Controller of Coal Mines with reference to the proposed interconnection of the electricity stations at Battersea, Fulham, and Hammersmith, stating that in view of the urgent necessity of reducing the coal transport for the London area during the coming years, the Controller was anxious to assist in the fair apportionment of the total cost of carrying out the scheme which was approved in principle in June, 1915, and asking if the B.C. was willing to submit the matter to an arbitrator to be appointed by the B. of T., whose decision should be final. The Committee has approved the suggestion.

Rotherham.

—Mr. Garnham Roper, of the B. of T., has held an inquiry in London relative to an application by the Corporation for a prov. order to supply electricity in bulk to the Mexboro' and Swinton Tramway Co. The prov. order was granted, but was limited to the period of the war and 12 months after.

Sunderland.—PRICE REVISION.

—At a meeting of the T.C. on the 11th inst., the Electricity Committee submitted a report which (*inter alia*) recommended that the tariffs for the supply of electricity be revised. Mr. G. S. Marshall contended that it was unfair that the revision should only apply to the small consumer. Alderman Bruce said the large consumer was under a sealed contract, and that the small consumer had never contributed anything towards the increased cost of coal until last year, while the shipbuilders—the large consumers—had always paid for the increased cost of coal. Eventually the report was adopted.

Southport.—The Corporation Electricity Committee has given permission to the Birkdale & District Electric Supply Co. to charge an additional 5 per cent. to private consumers of electrical current in Birkdale, on condition that the increased profits on receipts shall not be taken into account in the event of the subsequent purchase of the undertaking by the Corporation, and on the condition that the increased charges do not exceed those charged by the Corporation.

Stoke-on-Trent.—PRICE INCREASE.—The T.C. has further advanced the price of current from the meter readings at the end of the September quarter by 8½ per unit, making a total increase since the war began of 33½ per cent.

Sutton-in-Ashfield.—PROPOSED E.L.—The Nottingham T.C. has informed the U.D.C. that application is to be made to the B. of T. for a provisional order for electric supply.

Taunton.—YEAR'S WORKING.—The accounts of the Corporation electricity undertaking for the last year of operation show a gross profit of £5,167, of which £3,532 has been absorbed by loan charges, &c., and £521 transferred to the reserve account.

U.S.A.—According to the *Electrical World*, the Cincinnati Public Service Authorities intend to improve the lighting in 14 miles of streets, at an estimated cost of \$140,000. Some 913 new lamps are included, and 291 old arc lamps will be displaced. The new lamps will be of a 16-c.p. tungsten-filament nitrogen-filled type of 20-ampere 141-volt rating, placed 13 ft. 4 in. above the pavement, and operated through transformers in the base of the standards.

Worcester.—PROPOSED NEW PLANT.—After considerable discussion, the City Council has adopted the Electricity Committee's recommendation to purchase additional boiler and other plant, at a cost of £5,200. It was pointed out that the extension would facilitate the linking-up suggestions of the B. of T., and would also lead to economies in working—some £575 per annum—representing more than the capital charges on the new plant. An application for sanction to the additional plant has been made to the Government Department concerned, but so far without success.

TRAMWAY and RAILWAY NOTES.

Blackpool.—The Blackpool, St. Anne's, and Lytham tramway attained its majority on July 11th, the line having been opened on this date in 1896.

Canada.—The employees on the Toronto tramways recently struck work, demanding an increase of 5d. an hour, making 1s. 8d. an hour instead of 1s. 3d.

The strike was settled by the acceptance by the men of an offer of 3d. an hour increase in their wages.

Continental.—SPAIN.—The formation of a company for the construction and working of electric tramways and railways is, says *La Energia Electrica*, under consideration at Barcelona. The promoters are a Dresden firm, who, however, contemplate raising the capital by local subscriptions. Railway schemes immediately in view are a line from Almeria to Berja, and another from Coin and Ronda to Tolon (Balneario).

The Compania del Tranvia Electrico de Aviles has applied for a concession for the construction of electric tramways from Villalegre to Aviles and San Juan de Nieva.

SWITZERLAND.—A decision which the Administration of the Swiss Federal Railways has come to settles the question which has long hung fire. A water-power station is to be set up on the River Riton, on the southern slope of the Gothard range, providing a fall of over 800 metres. Three turbines will be installed at first, each of 12,000 h.p.—*L'Industrie Electrique*.

Halifax.—A tramway accident occurred at Ambler Thorne, Queensbury, on Sunday evening last, a Corporation car on the journey to Halifax getting out of control and leaving the rails and overturning; about 30 people were injured.

Heywood.—Alderman Ashworth, referring to the June receipts on the tramways, said if they were maintained at that level for the whole year, they would soon be paying, as they showed an average of 15.66d. per car-mile.

L. & Y. Railway Electrification.—A commencement has been made with the work of conversion of the Bury Holcombe Brook line of the Lancashire and Yorkshire Railway to the same system of electric traction as that in operation between Manchester and Bury, and it is expected that it will be completed at an early date.

London.—YEAR'S WORKING OF THE L.C.C. TRAMWAYS.—The annual accounts of the Council's tramways for the year ended March 31st last show total receipts amounting to £2,552,203 and working expenses, including war service allowances, of £1,817,691, leaving a gross surplus of £734,512. Interest, sinking fund, and other charges amount to £723,167, leaving a net surplus of £11,345, which has been transferred to the renewals fund, which stood on March 31st at £282,978. Previously to this year there have been no payments into this fund since the year 1912-13, except interest on investments and amounts received from the L.C.C. Tram-

ways, Ltd. The general reserve fund on March 31st last amounted to £72,390. During the year 586,127,976 passengers were carried and 49,478,973 car-miles run, these figures comparing with 515,429,397 passengers and 47,879,675 car-miles in 1915-16. The capital expenditure at March 31st amounted to £13,570,119, and the debt outstanding, less the sinking fund in hand and less £120,216 in respect of the value of surplus land, was £9,141,286. Capital expenditure on obsolete horse lines still to be provided for amounted to £943,710. The tramways system on March 31st, 1917, extended over a total length of 149 street miles, being 144½ miles of electric lines and 4½ miles of horse lines. The only horse tramway routes not yet electrified are those in Burdett Road and Grove Road, &c., and in Southwark Park Road, &c., and as the services on these tramways have been withdrawn, the system in operation consists entirely of electric tramways. During the year the only work of tramway construction undertaken was the doubling of certain portions of single line in Woolwich.

L.C.C. REVISED TRAMWAY ESTIMATES.—The following is a summary of the revised estimated results of the working of the tramways for 1917-18:—

Estimated gross surplus, £739,142; debt charges, &c., £730,811; leaving a net surplus of £8,598 instead of an estimated deficiency of £89,402. The estimates contain provision for £111,300 for war service allowances; but for this special charge, the results of working the tramways for the year would show an estimated surplus of approximately £123,000, notwithstanding the increasing working costs. The estimates contemplate £8,598 being available for addition to the renewals fund in 1917-18. The balance of the fund at March 31st, 1918, is estimated at £20,112, without taking account of the depreciation of investments; the estimated balance of the general reserve fund at March 31st, 1918, is £71,919 on the basis of investments being taken at cost price.

The Highways Committee recommends that application be made for an extension of the time allowed for the construction of certain tramways authorised, which will expire in August, 1918.

The Council has decided that 2d. workmen's tramway tickets shall no longer be available for the return journey or for a single journey by any car and on any route; also that workmen's return tickets shall only be available for return over the section for which they are issued for the first journey; and that workmen's tickets will not be issued to suburban termini by cars leaving the central termini after 7.30 a.m.

Manchester.—WAGES.—Sir George Askwith has decided to sit this week to hear the Corporation tramway employees' case for the revision of the recent wages award. Meantime, whilst the other Lancashire tramway authorities are protesting against the award being re-opened at all so soon, the Tramway and Vehicle Workers' Association, with which the Manchester employees are affiliated, takes the view that if the Manchester case is re-opened, those of the employees in the other districts must also be reconsidered, and the executive of the Association is demanding the re-opening of the whole award.

Northampton.—FARES.—The Tramways Committee is recommending the Council to increase the fares on the 1d. sections to 1½d., with a 1d. stage on each section. There was a loss of about £3,000 on the tramways last year, and unless the revenue is supplemented, there is a prospect of a considerably increased deficit on the current year. The institution of 1½d. fares for 1d. fares on one section has, on a three months' trial, led to an average increase of £30 per week in the takings on that section, and if this average is attained on the other sections, it is estimated that the revenue will be increased by £5,000 during the year.

TELEGRAPH and TELEPHONE NOTES.

A Long Telegraph Circuit.—New York maintains daily direct communication with Valparaiso, Chile, a distance of approximately 7,000 miles, over the cables of the Central and South American Telegraph Co. This is probably the longest regularly-worked circuit in the world.—*T. and T. Age*.

Brazil.—A decree has been issued declaring that the wireless telegraph and wireless telephone institutions in the country are exclusively the property of the Federal Government.

Foreign Languages on the Telephone.—The Postmaster-General, in a Parliamentary answer to Sir Henry Dalziel, states that conversations on the telephone in languages of enemy States are prohibited. The use of the languages of Allied countries is not, he thinks, open to objection, and it could not be forbidden without inconvenience to a large number of subjects of Allied States who, at present, are engaged on official work in this country.—*The Times*.

Recruiting at 3,000 Miles.—Lord Northcliffe, in a brief speech from New York to San Francisco, 3,000 miles away, over the long-distance telephone of the American Telephone and Telegraph Co., urged Californian Britishers "to do their bit" in the war. Conversations were held with many long-distance cities, and then the telephone officials switched on the wires which permitted the listeners to hear the Pacific surf at San Francisco and the Atlantic surf at Coney Island simultaneously.—*The Times*.

Wireless Telephony in the U.S. Navy.—A year ago, with the collaboration of the Bell Telephone Companies, a three-day test of communications as under war conditions was carried out by the United States Navy Department, in the course of which communication by wireless telephony was maintained between Washington and a battleship in the Atlantic Ocean. Since then the use of wireless telephony in the Naval Service has been further developed, and the system will be employed by the U.S. Navy in its war operations. Telephonic communication with aeroplanes, new wireless methods, and apparatus for detecting the presence of submarines have also been under investigation, and important progress has been made. — *T. and T. Age.*

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—**SYDNEY.**—August 22nd. N.S.W. Government Railways and Tramways. Thirty-six induction motors (Specification No. 488). September 19th.—One 225-H.P. synchronous motor (Specification No. 489). Particulars from Electrical Engineer's Office, 61, Hunter Street, Sydney.

Hford.—July 31st. Electricity Department. Two rotary or motor converters, 4,400 yards E.H.T. cable, 3,600 yards stoneware conduit. See "Official Notices" to-day.

Keighley.—August 3rd. 12,000 tons best slack and small slack coal for Electricity Department. Six-monthly and twelve-monthly period. Mr. H. Welber, Boro' Electrical Engineer.

London.—L.C.C.—The Highways Committee recommends that tenders be invited for 3,880 yards of electric cable for the Tramways Department.

I.L.M. OFFICE OF WORKS.—July 23rd. Six or twelve months' supply of conduit boxes. Controller of Supplies, King Charles Street, S.W. 1.

CLOSED.

London.—**SHOREDITCH.**—The Electricity Committee has received the following tenders for turbo-alternator plant at Whiston Street:—

British Thomson-Houston Co., Ltd.	£26,518
British Westinghouse Co., Ltd. (recommended)	26,538
Brush Electrical Engineering Co., Ltd.	30,250
Fraser & Chalmers, Ltd.	26,728
alternative	26,496
Howden & Co., Ltd.	27,193
Ateliers de Construction Oerlikon (Swiss)	31,815
Parsons & Co., Ltd.	25,900
Willans & Robinson, Ltd.	26,600

HAMMERSMITH.—The Electricity Committee has received the undermentioned tenders for E.H.T. cable:—

Pirelli-General Electric Co.	£176
Macintosh Cable Co. (recommended)	180
Callender's Cable & Construction Co.	204
Western Electric Co.	207
Henley's Telegraph Works.	209
British Insulated & Helsby Cables	234

The Baths Committee recommends the acceptance of the tender of Messrs. Rubery, Owen & Co. for a 20-H.P. motor, with circuit-breaker, starter, &c. for £125.

POPLAR.—The Electricity Committee recommends the acceptance of the following tenders:—

Switchgear.—British Westinghouse Co., Ltd.	£2,641.
Sub-station switchgear.—British Thomson-Houston Co., Ltd.	£1,621.
Cables.—Western Electric Co., Ltd., £1,782; Siemens Bros. & Co., Ltd., £2,081.	

Londonderry.—The Electricity Committee has accepted the tender of the Western Electric Co. at £2,080, for a new feeder cable.

Newport (Mon.).—Electricity Committee. Recommended tenders for plant for extensions:—

Induced-draught plant.—Musgrave & Co.	
Electrical equipment for induced-draught plant.—Brit. Westinghouse Co.	
Cooling towers.—Davenport Engineering Co.	

Swansea.—T.C. Messrs. Thomas & Evans, at £73 10s., for the installation of electric light in 27 Corporation houses on Trewyddfa Common.

NOTES.

Electric Light Switching.—The results of the fifth of the periodical Batch Exams, conducted in this subject by Messrs. A. P. Lundberg & Sons are given in our advertising pages, and are, to say the least, remarkable. It is only three months since the results of the previous Examination were given in this journal, and though the number of successful competitors then was very good for war time, the present list shows an increase of over 59 per cent. The average person would conclude that everyone who sent in a paper got a certificate. We are informed that this is by no means the case, 20 per cent. of the candidates having, in the present instance failed to satisfy the examiner. Those interested in the subject are advised to write to the firm at 477-489, Liverpool Road, London, E.C. 4, for particulars.

Foreign Trade.—**THE JUNE FIGURES.**—The official returns of imports and exports during last month contain the following electrical and machinery figures:—

	June, 1917.	Inc. or dec.	6 months, 1917. Inc. or dec.
IMPORTS.			
Electrical goods ...	81,272	— 69,610	— 110,772
Machinery ...	668,013	— 205,561	— 118,282
EXPORTS.			
Electrical goods ...	211,297	— 232,657	— 390,228

Volunteer Notes.—**COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).** Headquarters, Balderton Street, Oxford Street, W.

Orders for the week, by Lieut.-Colonel C. B. Clay, V.D., commanding:—
Monday, July 23rd.—Technical instruction (searchlight) for No. 3 Company, Right Half Company, Regency Street. Drill, No. 3 Company, Left Half Company. Signalling Class. Recruits' Drill, 6.30.
Tuesday, July 24th.—Lecture, 6.30. Physical drill and bayonet fighting, 7.30.
Wednesday, July 25th.—Drill and elementary bridge construction No. 1 Company, Right Half Company.
Thursday, July 26th.—Drill and elementary bridge construction No. 2 Company, Right Half Company. Ambulance Class, 6.30. Signalling Class.
Friday, July 27th.—Technical instruction (searchlight) for No. 3 Company, Left Half Company, at Regency Street. Drill, No. 3 Company, Right Half Company. Recruits' Drill, 6.30.
Saturday, July 28th.—Commandant's Parade, 3 p.m. Uniform, for route-march. Fall in at Goddard's Green Station.

MACLEOD YEARSLY, Company Commander and Adjutant.

Iron Wire for Rural Transmission.—The Connecticut Public Utilities Commission has agreed to the Central Connecticut Power and Light Co. using galvanised iron wire for H.T. transmission on certain rural lines, on account of the high price of copper. It is proposed to use double-galvanised BB grade No. 6 iron wire, on poles spaced 250 ft. apart, sagging the wire to give a factor of safety of 2 with class B loading, viz., $\frac{1}{2}$ in. coating of sleet on the wire and a wind pressure equalling 8 lb. per sq. ft. of exposed surface of wire and sleet, at a temperature of 0° F. The iron wire is to be used where voltage drop will be inappreciable, and will be replaced with copper if it deteriorates so as to be unsafe.

The Fixation of Nitrogen.—Mr. Baker, U.S. Secretary for War, announces that plants for the production of nitrates from atmospheric nitrogen will be constructed immediately, at a cost of about four million dollars. He states that water power will not be utilised, the process to be used being "a modification of processes previously known."

Inquiries.—Makers of spare parts for "A.E.C." motors are asked for.

Hospital Installation.—The Duke of Portland has offered an electrical installation for the treatment of paralysis, rheumatism, and other suitable maladies to the Mansfield and District Hospital.

Marylebone Electricity Department and the Electrical Trades Union.—The Marylebone B.C. Electricity Committee reports having considered a communication from the London District Secretary, Electrical Trades Union, 70, Gray's Inn Road, E.C. 1, forwarding working rules for power and sub-station engineers, and asking whether the Council is willing to conform to them, and pay rates of wages and observe conditions of labour as appear therein; and stating that in the event of the Council refusing to agree to the rates of pay and conditions of labour laid down in the working rules, the Trade Union Committee will have to name the Council to appear before the Committee on Production to hear the claim of the Union to make their conditions apply to the men in the Council's employ. The Electricity Committee has informed the secretary of the Electrical Trades Union that it has recently increased the wages of the employees of the department, and has come to an agreement with the representatives of the men, and is not prepared to reopen the question.

Parliamentary.—**ROYAL ASSENT.**—The following Acts have received the Royal Assent:—

Trade Union Amalgamation Act, 1917.
Nottinghamshire and Derbyshire Tramways Act, 1917.
Lancashire Power Construction Co., Ltd., Act, 1917.

Holidays on the Clyde.—Shipyards, engineering shops, and other works in Glasgow and on Clydeside closed, on July 12th, for 10 days' holiday. — *Times.*

National Insurance (Unemployment) Acts, 1911 to 1916.—Contributions are payable in respect of:

2,352 X. Apprentices over 16 years of age employed wholly or mainly by way of manual labour elsewhere than in Scotland in trades set out in Schedule 1 of the National Insurance (Part II) (Munition Workers) Act, 1916, or in munitions work, and who are bound by agreements which are not under seal and which do not purport to have been sealed.

2,353. Apprentices over 16 years of age employed wholly or mainly by way of manual labour elsewhere than in Scotland in trades set out in Schedule 6 of the National Insurance Act, 1911 (Unemployment Insurance), and who are bound by agreements which are not under seal and which do not purport to have been sealed.

2,354 X. Workmen engaged in the manufacture of telephone switchboards for use in war.

2,357. Workmen engaged in the repair of accumulators used in connection with electrical machinery in buildings or ships, including cleaning sediment from the cells. (Application 196.)

B. of T. Coal Transport Reorganisation Scheme: Special Fuel.—In connection with the above scheme, the Controller of Coal Mines is considering the requirements of steam raisers in regard to supplies of special coal fuel. Forms have been sent out to steam raisers throughout the country asking for information in regard to the class of coal used, consumption, &c. A considerable number of the forms sent out have not been returned, and steam raisers who have received such forms should note that their requirements in the way of special fuels cannot be considered in the absence of the information called for by the forms, which should be filled in and dispatched to the Controller of Coal Mines immediately. In cases where steam raisers have not received forms, it is desirable that they should apply at once to the Controller of Coal Mines, 8, Richmond Terrace, Whitehall, London, S.W. 1.

Synchronous Signalling.—In a letter to *Nature* Prof. Joly, of Trinity College, Dublin, draws attention to a notice recently issued to mariners by the Board of Trade, in which the principle of synchronous signalling is applied for the first time to the determination of distance at sea. The notice states that on the Fire Island lightship, at the approach to New York Harbour, a combined radio and submerged sound signalling system has been installed, for use more especially in thick weather. The range of the apparatus is limited to that of the submarine bell receiving equipment, i.e., six or seven miles. The submarine bell strikes six strokes, pause, then eight strokes once every 38 seconds. Beginning shortly after the first stroke of the six, about $\frac{1}{2}$ second, the ship emits a series of radio signals. In order to determine the distance of a ship from the lightship it is necessary to count each of these radio dots until the first stroke of the six submarine signals is received. The number of dots thus determined gives the distance in half sea miles from the lightship. Example:—Eleven radio dots are received before the first stroke of the bell: the distance is $11\frac{1}{2}$ or $5\frac{1}{2}$ miles. The most convenient method of receiving these signals is to have one receiver connected to the radio and the other receiver connected to the submarine bell detector, thereby connecting one ear to radio signals and the other to submarine signals. The particular mode of applying synchronous signals above described, says Prof. Joly, enables the mariner to dispense with the use of stop-watch or chronometer. If a wireless and a submarine signal be started together, the latter lags $1\frac{1}{2}$ seconds for each mile travelled, or for each half mile the lag is $0\frac{1}{2}$ second. Hence if the instantaneous signal is repeated every $0\frac{1}{2}$ second, the first of these being emitted $0\frac{1}{2}$ second after the first submarine signal, the mariner at half-mile distance from the shore station gets both initial signals together. At one sea mile he gets the first submarine signal along with the second radio dot; at one and a half sea miles the third radio dot coincides with the first submarine bell stroke. Hence the rule: Divide by 2 to find the distance in sea miles.

The application of synchronous signalling to avoiding collision at sea is perfectly simple, and the step now taken should lead to its careful consideration and trial. In this case a vessel A, when overtaken by thick weather, emits synchronous signals, say, every two minutes. Another ship, B, hearing these, not only learns of the presence of A, but also gets her distance at once. B is also signalling, so that like information reaches A. Each ship now signals her course and speed. The navigating officers on A and B then read on an instrument of simple construction (1) the rate at which the ships will be hearing one another, and (2) the mutual bearings of the two ships—if collision is threatened. And now after two minutes each officer, on receiving the second synchronous signal of the other ship, is able to say whether danger threatens him or not. For if this second signal tells him that the ships have approached each other by a certain distance during the two minutes (a distance read directly on the "Collision Predictor") there is danger of collision. If the distance covered is less than this (it cannot be greater), there is safety. The third synchronous signal may be used to confirm the result.

Buyers—Beware!—Under this title the *Revue Générale de l'Electricité* prints a warning in connection with an advertisement appearing in the *E.T.Z.* as follows (translation):—

SWITZERLAND.

A Swiss electrical firm with large capital, having the best export connections, will resume after the war the export as well as the improvement [the *Revue* suggests "disguise"] of German electro-technical products. First class references will be supplied on request. Address inquiries to Alfred R. . . . Hamburg . . . (for obvious reasons we suppress the address).

Our contemporary remarks that we have amongst neutrals good and loyal friends, but there are also within their borders agents who will seize every opportunity to make money, though it be stained with the blood of thousands of human beings. We have been taught to be cautious, and we echo the warning after-war buyers, be on your guard!

The A.S.E.—For the post of assistant general secretary of the Amalgamated Society of Engineers, Mr. John E. Arthur, of Lambeth, has been elected. —*Daily Chronicle*.

Excess Profits Duty.—There was a lengthy discussion in the House of Commons on Monday, when the Finance Bill was under consideration. Mr. G. Terrill moved a new clause on behalf of manufacturers, most of which had come into existence since the outbreak of war, the object of the clause being to protect manufacturers so that when a tax is levied on profits it is real net profits that are taxed, and not something more than profits. All manu-

facturers should be allowed the depreciation which a prudent trader desirous of maintaining his trade or business in a high state of efficiency considered necessary. The Government should encourage manufacturers to equip their works in the most up-to-date fashion. The amendment was negatived after the Chancellor of the Exchequer had reminded the House of the protection which firms now had with regard to depreciation, and that they could go in every case with a direct appeal to the Referee if it was considered that a grievance existed. The proposed clause would have meant that the whole excess profits tax would end so far as manufacturers were concerned. Sir J. Harwood Banner moved a new clause with respect to the valuation of stocks, the effect of which, he said, would be to stereotype the basis of values of stocks during the period of excess profits duty. Throughout the country an enormous amount of stock held by manufacturers had been entered at cost: now the Government required the stock to be taken at market price, which would mean that they would have to pay on paper values which might never be realised. After some considerable discussion, Mr. Bonar Law announced that, in order to meet the views of members, the Government would put two years in the White Paper as the period to be allowed after the termination of the war in which to ascertain by actual realisation the value of the stock appearing in the account at the end of the last accounting period, and an allowance would be made from the profits of that period for any difference between the valuation and the sum realised. The period previously proposed was a fixed period of a year from the termination of the war, for all businesses. Sir J. Harwood Banner then withdrew his clause.

Electric Power Supply.—General Croft, in the House of Commons, on July 11th, asked the President of the Board of Trade whether, in view of his having promised to increase the representation of local authorities owning electricity undertakings on the Committee of Electric Supply, he would consider appointing a member to represent the provincial electric supply companies working under Provisional Orders and subject to purchase.

Sir Albert Stanley replied: I am of opinion that the Electric Power Supply Committee as now constituted is sufficiently representative of all bodies owning electricity undertakings, including those described, and I am not prepared to make any further additions to it.

Mr. Gilbert asked the President of the Board of Trade if he would state how many members of the Departmental Committee on Electric Power Supply were directors of electric power companies; and if he would state the qualifications of the last three members appointed to represent the interests of municipal electrical undertakings.

Sir Albert Stanley replied: There are three members of the Committee who are directors of electric power supply companies. Of the three members referred to in the latter part of my hon. friend's question, Mr. Harold Dickinson is the electrical engineer to the Corporation of Liverpool, and was nominated to serve on the Committee by the Association of Municipal Corporations. Mr. Vesey Knox, K.C., has acted as counsel for many urban district councils owning electricity undertakings, and was nominated by the Urban District Councils' Association. Mr. W. B. Smith is a member of the Glasgow Town Council, who own the largest municipal electricity undertaking in Scotland, and was nominated by my right hon. friend the Secretary for Scotland, on the recommendation of the Lord Provost of Glasgow.

Mr. Gilbert asked the President if he would be prepared to consider whether the London undertakings should also have a representative on the Committee.

Sir A. Stanley: I should like notice of that.—*Financial News*.

In the House of Commons, General Croft asked the President of the Board of Trade whether, having regard to the fact that the latest additions to the Board of Trade Departmental Committee on the Supply of Electricity were all representatives of municipal interests, he would reconsider his determination to exclude representatives of electric supply companies which were liable to purchase, and whether his attention had been called to the fact that these companies, subject to purchase, represented a capital of £25,000,000 sterling.

In a written reply, Mr. Roberts (Secretary) said: The Committee already includes representatives of the companies described, and the President does not see any reason to alter his decision not to make any further additions to the Committee.—*Financial Times*.

Report of the Electrical Trades Committee.—In the House of Commons, General Croft asked the President of the Board of Trade whether the reports recently made by the Electrical Trades Committee and the Coal Conservation Sub-Committee on Electric Supply had been published, and, if not, whether they would be published at an early date. Mr. Roberts said that the Government had decided that it is not desirable to publish at present the reports of Committees on the various aspects of industrial and commercial reconstruction. All the recommendations of these Committees were receiving earnest consideration.

Electrically-heated Moulding Presses.—The Westinghouse Electric and Manufacturing Co., of East Pittsburgh, Pa., has adopted electric heating for 23 presses used in the manufacture of moulded composition material. These presses were formerly heated by steam, but a trial of an electrically-heated press proved so satisfactory that the entire set of presses in the company's moulded-insulation department is now being modified for equipping with electric heaters.

A series of tests made on one of the presses shows that from one to $1\frac{1}{4}$ hours are required to heat the plates, starting cold, and that 1,800 watts are required to keep the press hot while in steady use for work requiring a temperature of 190°C .

Rats!—A City shop employé, fined 20s. for not properly shading lights in the premises, explained that they were properly switched off when the shop was closed for the night, and said that they must have been switched on again by a rat.—*The Times*.

Scientific Research.—The trustees of the Beit Fellowships for Scientific Research have recently elected Mr. Leslie Hartshorn to a Fellowship. He will carry out his research in the Imperial College at South Kensington.

Electricity Works Employes and Exemption.—The borough electrical engineer of Southend has reported to his Committee in regard to the applications made to the local Tribunal for the exemption of five men whose services the Committee had considered essential, that, subsequent to the applications being made, the system of exemption of men employed in undertakings certified under the Munitions of War Act (of which the electricity undertaking is one) had been revised, and that in accordance with the new system applications had been made to the Munitions Area Recruiting Officer by the men referred to, for protection certificates exempting them from military service so long as such certificates should remain in force, and that the certificates applied for had been granted. He further reported that one of the certificates had since been withdrawn. The town clerk was directed to communicate with the Munitions Area Recruiting Officer, with the object of arranging a conference between the chairman, the electrical engineer, the local Military Representative and the officer himself with respect to the men employed in the electricity undertaking whose services the Committee regards as essential to be retained.

Liberty Bonds.—Up to June 14th employes of the Central Group of Bell Telephone Companies subscribed for \$652,850 in Liberty Bonds. Chicago Telephone Co.'s employes took \$370,250, 5,891 subscriptions being for \$50. Commonwealth Edison Co. employes to the number of 6,043 subscribed for \$506,600.—*Elec. Rev. and Western Electrician*.

Engineering Wages: Further Advance.—An award has been issued by the Committee on Production giving a further advance of wages to all grades of workmen employed by members of the Engineering Employers' Federation. The award is given in pursuance of an agreement between the Federation and 46 Trade Unions connected with the engineering and foundry trades, under the terms of which the Committee on Production may be called upon at intervals of four months (*i.e.*, February, June, and October) to consider what alteration in wages is warranted by the abnormal conditions due to the war. The awards now issued give a further advance of 3s. per week, making the aggregate increase on pre-war rates 15s. per week. An advance of 1s. 6d. per week is given to boys and youths.

Scottish Electricians' Wages.—Mr. James M. Davies, jun., secretary of the Electrical Contractors' Association of Scotland, states that the general effect of the wages award is that the employes in the Glasgow district receive an advance of 1½d. per hour as from the beginning of June. The employes have already received more than the 7s. minimum advance, in two advances of 1d. and ½d. respectively (making for the 54 hours' week, 7s. 10½d.).

Higher Education.—The Society of Chemical Industry held its annual meeting, in Birmingham, on Wednesday and Thursday, concluding to-day, and we will refer to a number of matters of electrical interest in our next issue. In his presidential address, on Wednesday, Dr. Charles Carpenter referred to the necessity for bringing our governing classes more into contact with the working classes—which make up the bulk of the population—in early training, if they were thoroughly to understand their outlook on life. In coming into contact with men holding important positions, he had been struck by the remarkable fact that, although they had been fully qualified to deal with big businesses and organisations, they had not the least idea how to manage and deal with workers. The reason was that their early training gave no opportunity for getting into close and personal contact with them.

He suggested that a boy, on reaching the age of 16, should commence, either at the desk or in the factory, with compulsory attendance at continuation schools. After two or three years he would, if showing himself to possess the necessary ability, be fit for entrance to the university. At the same time, it should not be left to chance to determine the path which the boy followed after leaving school. If the teaching authority had properly looked after him, it should be easy to divine the pupil's leanings, and direct his course in accordance with them. As a preliminary step towards this, the first principles of experimental science should be taught compulsorily at the primary schools. In this matter, the community required, and was entitled to have, the assistance of the State. Our educational system needed alteration at the foundation. In his opinion, a boy was old enough to learn science when he was old enough to learn history and geography. Incidentally, Dr. Carpenter urged the importance of the interdependence of the engineer and the chemist, and regarded it as imperative that they should get into double harness as soon as possible.

Prohibited Exports.—The Supplement to the *Board of Trade Journal* of July 19th contains complete lists of articles which, according to the latest information received by the Board of Trade, are prohibited to be exported from British India, Australia, Canada, New Zealand, South Africa, Newfoundland, Egypt, Cyprus, and Ceylon.

Appointments Vacant.—Engineer-in-charge (55s.) and senior switchboard attendant (10s.), for the Darlington Corporation Electricity Department; shift engineer (£115) and engine fitter and turner, for the Dover Corporation Electricity Works. See our advertisement pages to-day.

Russian Electro-Technical Institute.—The Ministry of Trade and Industry has prepared a project for the transfer of the Electro-Technical Institute from the control of the Ministry of the Interior to that of the Ministry of Trade and Industry. The Department proposes the reform of the basis of the professional educational side of the Institute, in order to fit it better to meet the greater demands on it, and the requirements of the electro-technical industry. The Minister of Posts and Telegraphs protests against the move, as the original home of the Institute was in this Department.

Steel-cored Aluminium Wire.—The employment of this material is described in an article on the supply of electricity to Pomona, a "small town" of 600 inhabitants, or what we should call a village, in the *Electrical World* of May 5th. Power is transmitted from a station at Ottawa (Kan.), 11 miles (17.7 km.) distant; lattice steel poles are used, carrying No. 1 B. and S. stranded steel-cored aluminium wire, with a sag of 17 in. (432 mm.) at 70° F. The pressure is 6,600 volts, single-phase, reduced to 220–110 volts for distribution, the total power provided for being 15 kw. The transmission-line poles are 250 ft. (76.2 m.) apart; on the distribution lines, consisting of Nos. 0, 2, 4, and 6 B. and S. gauge wires, about half this spacing was adopted. The installation cost in all \$12,252, and the consumers number 110. The price is 6d. per kw.-hour, and energy is purchased from the generating station at Ottawa at 1½d. per kw.-hour. The average supply is 2,089 kw.-hours per month, costing in all \$62.68.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—The Bradford Corporation Tramways Committee has increased the salary of Mr. J. W. DAWSON, assistant electrical engineer in the tramway department, from £295 to £325 per annum.

Gravesend T.C. has disagreed with a motion to grant a war bonus of £50 a year to the electrical engineer, Mr. McINNES, and has passed an amendment asking Mr. McInnes not to press for any increase until after the war.

Colechester T.C. has, having regard to the special services rendered during the past two and a half years, increased the salary of the electrical engineer, Mr. FRISBY, by £50 a year as from June 1st.

Mr. D. H. C. LAE, who served his articles at the Folkestone electricity supply works, has been granted a commission in the R.F.C.

General.—The wedding took place on July 5th, at Holy Trinity Church, Houghton, of Lieutenant EGERTON JOHN WARD, A.M.I.E.E., The Royal Irish Regiment, to Olive Mary Langton, second daughter of the Rev. T. L. Webster and Mrs. Webster, of Houghton Vicarage, Preston, Lancs.

Mr. LORENZO W. MIGOTTI, who for the past nine years has been electrical engineer to the Bahia Blanca North-Western Railway, and manager of the South American Light and Power Co., and who was formerly with the Underground Railways of London, has accepted the post of chief engineer to the Electric Supply Co., of Rosario de Santa Fé, Argentine Republic.

The Hon. GILBERT JOHNSTONE having resigned from the L.C.C. Special Committee on London Electricity Committee, the Committee recommends that Mr. F. C. HARRISON be appointed to fill the vacancy.

In commemoration of the completion of the 21st year of the working of the County of London Electric Supply Co., Ltd., the company presented silver match-boxes to members of the staff, and gold medallions to the chief officers. These were inscribed as follows:—"To commemorate the 21st year of working 5,000 kw. per annum in applications, and 1,000,000 units sold per week, 1916." The directors and chief officers of the company also presented to the chairman, Mr. J. B. BRAITHWAITE, a rose bowl and salver in commemoration of the above and of his association with the company since its formation.

On Monday last, at a meeting of the Manchester Education Committee, Mr. GEORGE GERALD STONEY, B.A., F.R.S., &c., was recommended for appointment as Professor of Mechanical Engineering in the Manchester School of Technology.

Our Chicago namesake says that Mr. SAMUEL INSTILL, president of the Commonwealth Edison Co., Chicago, Ill., has been given the degree of Doctor of Science by the Union College, of Schenectady, N.Y., in recognition of labours in the development of electrical science.

Roll of Honour.—Lieutenant CYRIL STREET, R.F.C., killed in action, was trained as an electrical engineer at Broadbeath, Manchester.

Sergeant F. C. PLATT, R.E., who has been awarded the Military Medal for bravery in the field, was employed as an electrical engineer by the Wolverhampton Corporation.

Mr. A. J. COLLINS, of Scorton, a wireless telegraphist on one of H.M. ships, has been killed at sea, his vessel being torpedoed or mined. He was 30 years of age, and was recently awarded the Distinguished Service Medal.

Lieutenant FRANK S. SCARR, Australian Engineers, who has fallen in action near Bullecourt, was formerly on the staff at Enfield, N., of the Ediswan Co. He was 38 years of age, joined the ranks, and saw service in Gallipoli. For his services in that theatre of the war he was complimented by Sir Ian Hamilton, and was given his commission on the field.

Able Seaman D. COLMAR, R.N., who has died at Haslar Hospital at the age of 37 years, was prior to the war manager's assistant at the Totnes electric light works.

Private ARTHUR HOLGATE, York and Lancaster Regiment, killed in action, enlisted from the Doncaster Corporation tramway staff.

ALBERT WOODCOCK, S.P.O. Torpedo Boat Service, reported killed, was formerly employed at the Bradford Corporation electricity works.

Private J. T. HALL, who was in the turbine department at Wheatley Hill Colliery (Co. Durham) has been killed in action.

Private J. CHARNOCK, King's (Liverpool Regiment), formerly reported missing, and now officially reported killed, was employed by Messrs. Dick, Kerr & Co., Ltd., Preston. Lance-Corporal HESKETH, Loyal North Lancashire Regiment, killed in action, was also employed by the same firm.

We desire to tender to Dr. and Mrs. Ferranti on our own behalf, and we are sure also on behalf of a host of sympathisers in the electrical profession, our sincere condolences with them on the death of their eldest son, Major BASIL DE FERRANTI, M.C., R.G.A., from wounds received in action on July 12th. That Major Ferranti was wounded was announced in our last issue, but we regret that he has now to be reckoned among the increasing number of electrical men to whom it has fallen to make the supreme sacrifice.

J. W. WOOD, an employé of the Marylebone electricity department, at present serving as a sergeant in the R.A.M.C. in France, who was awarded the D.C.M. for services in the field last year, has now been awarded the Croix de Guerre by the French Government in recognition of work done during the past 12 months.

Lance-Corporal JOHN ARMSTRONG, R.E., who has been killed in action, was engaged in the electrical department of the Calico Printers' Association, Ltd., Manchester.

Bombardier E. WADE, R.G.A., wounded and in hospital abroad, was engaged in the British Westinghouse Works at Trafford Park.

Private ALLWAY, Gloucester Regiment (T.F.), who has died from wounds, was employed at the Bristol Corporation electricity works.

Obituary.—MR. FRANK PATCHETT.—We regret to record the death of Mr. Frank Patchett, J.P., of Halifax, at the age of 69 years. He was the owner of the business conducted as George Patchett & Sons, wire manufacturers, with which firm was incorporated several years ago the Northern Electric Wire & Cable Manufacturing Co. He was one of the oldest magistrates for Halifax.

CITY NOTES.

General Electric Co., Ltd.

Presiding at the annual meeting, on Tuesday, Mr. H. HIRST said that the total net profit had increased by about £70,000—£30,000 on trading account and £40,000 revenue from investments. The investment account, which had shown a steady yield of about 10 per cent., had increased by, roughly, £350,000, and the net revenue from this source had grown correspondingly. This was mainly due to the acquisition of shares in the Osram Robertson Lamp Works, Ltd., of which they were only part owners in the past, although they always managed the factory, and absorbed its entire output. The scarcity of raw materials and skilled labour, and the uncertainty of the patent situation, as well as certain war work, which interfered with the standard output, made it more than likely that the revenue from this investment might not be quite up to this year's level in the near future. They had, however, planned extensions, acquired improved methods of manufacture, and made arrangements for the starting of a research laboratory, so that as soon as they could go full-speed ahead they would again reap the fullest benefit from this bold venture. It was desirable that they should have plenty of cash at disposal. Raw material prices were still soaring at a great height. To-day the same amount of business as in pre-war time necessitated the employment of nearly double the amount of money; on the other hand, credit was considerably shorter, purchasing was more irregular through difficulties of transport, and funds must therefore be at disposal at a moment's notice in order to secure materials when they were to be had. This was sufficient explanation of the

bank loan. With reference to the additions to reserve, they had always striven to strengthen and develop the company so as to make it one of the strongest electrical concerns in the country. They had therefore put to a contingency account every year a certain sum which should, approximately, cover any possible losses. By that means the investments were always kept at par value. In the course of time, however, the allied and subsidiary companies developed and made profits, which were used in the first instance to wipe out previous losses or establishment charges, and as soon as this was accomplished the reserves originally allotted to them became free. The £100,000 transferred was an amount freed from such accounts, and also from contingencies in connection with contracts, which fortunately did not arise. In making this transfer they had not departed from their usual conservative policy. He hoped that the ordinary shareholders would approve their refunding this year the income-tax to preference shareholders by way of a special bonus. The ordinary shareholders were reaping the full benefit of the prosperity of the company, not only by an increased dividend, but also by the appreciation of the value of their shares. The directors felt that they had been just to the demands of labour and employes, and thus the only class suffering under present conditions was the preference shareholder, who had a fixed rate of income, with an increasing rate of income-tax. The preference shareholders numbered about 3,000, mostly small investors, many of whom probably felt the stress of the times very much. Some ordinary shareholders thought that the results of the year warranted a bigger dividend. He appealed to them to be satisfied with their proposal. The present war would change many things—perhaps everything. Nothing would be quite as it was before the war, but of all the changes that would alter industry in this country, the electrical industry would undergo the most drastic transformation. Electrical plant in the country at the present moment was run at high pressure to a premature death. Under present conditions none but the most important plant could be replaced, and the replacement and re-organisation necessary after the war would be a tremendous task for the existing electrical companies, which had yet to make good a deficiency in output to cover the demand, which in pre-war time was supplied by importation. War had taught this country the necessity of home production. Many industries on which this country relied would have to modernise their methods and rejuvenate themselves. Electric power, heat and light were primary essentials in the carrying out of such a programme. The depletion of rolling stock in the country would have to be made good, and railway electrification on a large scale had suddenly appeared within the realm of immediate practical politics, for which many of them must prepare. Greater efficiency and economy throughout this country occupied the mind, not only of industrialists, but also of Government departments. They heard much nowadays of barbaric waste of coal, and only the other day the Controller of Coal Mines had to issue an Order to save labour, transport, and rolling stock, which divided the country into areas within which coal from certain districts could only be circulated and used. He was convinced that the extraction of by-products from coal would have to be treated from a national point of view. He was convinced of the necessity for the creation of large generating stations in some 15 to 20 centres throughout the Kingdom, so that instead of coal being transported to big power units, big power units would be transported to the coalfields, and, after the extraction of by-products, electric current or gas, or both, would be transmitted to towns and industrial undertakings to supply power, light, and heat through cables and pipes, and the necessity for the conveyance of coal by rolling stock would be reduced to a small proportion. Many industries, especially certain chemical industries, above all the production of fertilisers, would thus become practicable in this country, whereas in the past they were relegated only to countries where water-power was available. Power, the foundation of all modern industry, would then, thanks to our natural resources, be produced in this country as cheaply, if not more cheaply, than in any other part of the globe. He had said nothing of the electrical requirements of the overseas dominions, and of poor Belgium and many of the Allies, whose wants in the past had been largely supplied by enemy countries. He had, however, said sufficient to indicate a few aspects of the big task expected from the electrical industry, and the "G.E.C." meant to take its proper part in this evolution and in these developments. It was for that reason that they were not at present suggesting a higher dividend, but preferred that the company should be strong enough to command any capital required, and to run certain risks connected with such new enterprises without prejudice to its future prosperity. Income-tax and excess profits must be paid, and the directors could only appeal to the ordinary shareholders for an altruistic policy to attain these great ends. He was convinced that some day, perhaps not too distant, they would reap very tangible results from this present self-denial. Their capital, and the skill of the directors and staff would, however, not alone bring about these changes, which were so essential for the national benefit. They must above all have the co-operation of labour. The relationship between the management of their company and labour throughout their history had been good—as good as that of any concern in the country. Yet there had been in the past occasional periods of tension

and stress which, in spite of goodwill on both sides, had been difficult to overcome. Present conditions had brought about better vision. The conditions of the country, and more particularly the outlook after the war, had made it clear to all that mutual understanding was essential in the national interests. The leaders of Industry and Labour had at last met to exchange views; they were comparing notes and formulating ideas, even programmes, which should go far to remove a great many of the past difficulties. Let them hope before the war was finished a means or machinery might be found which would solve any future difficulties which were bound to crop up from time to time without resort to strife. From personal experience gained during the past year, he knew that the desire for harmonious working existed, and had been fostered by genuine patriotism on the part of both employers and employes. Much patience was, however, still required to make these ideas effective and to bring them to fruition. For two or three generations, both classes had been set against each other, mistrust and prejudice had been preached, and it required not only goodwill and intention, but also a period of probation and experiment of the most varied kind to bring home to each side a conviction of the sincerity of the other. He was sorry to say that the list of those of their staff and workpeople who had given their lives in the great cause had grown to 119; 209 had been wounded, six were prisoners of war, and 40 were missing. Amongst the honours awarded to their men were two Military Crosses, two Distinguished Conduct Medals, eight Military Medals, and two Meritorious Service Medals.

The report for 1916 shows that after deducting general and legal expenses, administration charges and interest, £341,850, there is left \$5,674,612. Dividends on the preference and ordinary shares absorbed \$4,851,488, leaving \$823,151. The reduction in the surplus of net revenue for the last two years, attributable to the decline in exchange from the rates prevailing for several years before the war, is approximately \$3,000,000 for 1915 and \$3,300,000 in 1916. Since the middle of April the exchange value of the milreis has advanced from 12d. to 13½d. on June 13th. If this rate is maintained the net revenue should show a very substantial increase. The surplus profits of the subsidiary companies and the Brazilian Traction since their incorporation, which at December 31st, 1915, remained undistributed in dividends, amounted to \$14,773,244. Of this \$4,600,000 has been allocated to special reserve accounts for renewals, contingencies, &c. A further sum of \$1,500,000 has been applied for payment of the sinking fund instalments of the first mortgage bonds of the Rio de Janeiro Tramway, Light & Power Co., leaving \$8,613,244 unappropriated on the books of the companies, which sum has been invested in the development of the enterprises of the subsidiary companies. Out of this surplus the total amount allocated to special funds is \$4,600,000.

The trading profit of the Lancashire Electric Power Co. for 1916 was £38,710, plus £1,128 interest on hire-purchase plants, &c., making £39,839, as against £32,843 for 1915. £2,061 brought forward is added. Debenture interest has required £1,500, there has been put to reserve £15,000, a dividend of 3 per cent. on the shares absorbs £14,700, and £7,703 is to be carried forward. The following figures show the development of the Parliamentary company's business for the past three years:—

	1914.	1915.	1916.
Units generated	32,157,185	35,768,064	40,842,652
Max. load in kw.	10,210	10,740	11,900
H.P. connected	27,018	29,000	30,600
Receipts	£65,433	£72,395	£97,964
Expenditure	£35,472	£40,160	£59,254
Profit on trading	£29,961	£32,235	£38,710

The revenue account of the Lancashire Power Construction Co., Ltd., shows that the total interest, dividend, and other receipts for the year amounted to £19,205, and after deducting therefrom debenture interest, trustees' fees, and general charges payable, £15,468, the available balance is £3,735, which is to be carried to reserve. A Bill to re-arrange the capital of the company and for other purposes, has received the Royal Assent, and the re-arrangement will now be proceeded with. Annual meeting: July 26th.

New Issue.—The "Manchester Guardian" states that, in order to complete extensions at their works at Middlesbich, the Electro-Blench & By-products Co. are issuing the balance of their authorised share capital at par—namely, 7,356 preference and 8,000 ordinary shares. Treasury sanction has been obtained. The company, which took over the properties of the old Electrolytic Alkali Co., began manufacturing in January, 1915, and in consequence of the demands on the chemical industry have been very busy since. For 1915 the dividend was at the rate of 7 per cent., the profit being £25,571, and out of this £4,000 was placed to reserve. Owing to the pressure on the Ministry of Munitions and the consequent delay in adjusting the duties payable by the company as explained at the annual meeting last month, the accounts for 1916 have not yet been published, and the directors have repeated the 7 per cent. dividend.

British Thomson-Houston Co., Ltd.—Profit for 1916, after deducting expenses other than interest, £359,361, plus £73,359 brought forward, less £70,000 for excess profit duty and increased depreciation for 1915. Reserve re raw materials at December, 1915, not required and written back £25,000. Interest on loans and debentures £70,000, appropriated for depreciations £153,700, leaving £163,923 to carry forward, subject to deduction of munitions levy for 1916. Mr. E. Thurmauer retires from the board.

Mather & Platt, Ltd.—Interim dividend on the ordinary shares, 5 per cent. for the half-year, less income tax.

St. James' & Pall Mall Electric Light Co., Ltd.—Interim dividend at the rate of 7 per cent. per annum on the ordinary shares.

Sao Paulo Tramway, Light & Power Co.—Dividend 10 per cent., to reserve \$1,350,000, to depreciation and renewals \$250,000, carry forward \$32,757.

Rio de Janeiro Tramway, Light & Power Co.—Dividends 5 per cent., to general reserve \$1,750,000, to depreciation and renewals \$750,000, carry forward \$56,512.

Kaministiquia Power Co.—Quarterly dividend \$1½ per share (7 per cent. per annum).

West African Telegraph Co., Ltd.—The accounts show £12,720 available, as compared with £25,317 for 1915. £2,000 (against £13,000 has been transferred to reserve, and a further dividend of 2 per cent. has been paid, making the usual distribution of 4 per cent. for the year, free of tax.

W. & T. Avery, Ltd.—Further dividend, 10 per cent., less tax, making a total of 12½ per cent. for the year, placing £13,000 to reserve, and carrying forward £12,564.

Hadfields, Ltd.—Interim dividend, 1s. per share, free of tax, on the ordinary shares.

Metropolitan Electric Supply Co., Ltd.—Interim dividend, 2 per cent. per annum (1s. per share) on ordinary shares.

Lima Light, Power & Tramways Co.—Dividend, 1 per cent.

Nairobi Electric Power & Lighting Co., Ltd.—Interim dividend at the rate of 6 per cent. per annum for the half-year ended June, 1917.

Singapore Electric Tramways Co., Ltd.—Interim dividend, 5 per cent.

STOCKS AND SHARES.*

TUESDAY EVENING.

RISEING Consols are as clear an index as can be desired of the investor's frame of mind, and Consols just now are what the Stock Exchange calls a good market. The strength of the stock finds apt reflection in the other investment departments, and sound industrials are particularly in favour. Stock Exchange jobbers have become very cautious in selling shares they have not got, because time after time their expectations of buying back the shares have been disappointed, holders declining to sell at prices they would have deemed tempting six months ago.

Therefore quotations respond with alacrity to the growing pressure to buy. Metropolitan Electric preference are ½ up. The company has this week declared an interim dividend of 2 per cent. on its ordinary shares, the same rate as last July's. Other interim dividends will probably follow the same sort of line, and repeat their last year's interim declarations. City Lights are ¾ up at 12½, and County ordinary hardened to 11. General Electric ordinary at 16½ are the fraction to the good. British Westinghouse preference show strength at 2 9/16, this being 3/16 up. Edmundsons at 2½ are ½ better on the report; the preference dividend is secured, though net profits at £12,300 are about a thousand pounds down compared with 1915-1916.

County of Durham Electric 5 per cent. debenture stock has been removed from the pages of the Stock Exchange Official List by reason of the infrequency of dealings, the last recorded bargain having been at 9½ on October 17th, 1910.

The Home Railway dividend season begins this week, and there is mild curiosity as to how the companies will show up. It is taken more or less for granted, however, that the forthcoming interim dividends will be, like those of the electric lighting companies, the same as the 1916 levels. Most of the prices fairly well maintain their recent spurts, but Districts and Metropolitan have both lost ¼, and the price of the latter looks high enough, in the light of its one per cent. dividend. Districts, on the other hand, having received no distribution for the past 31 years, are not handicapped in the same way, their vogue being due to "possibilities"—always more attractive than a meagre dividend. Underground comes at 84 are ½ better on the week.

Mexican news is said to be much more favourable, and while the industrials have not moved, Mexican Government and Railway issues are up, this usually being precursory to a stiffening of the others. A substantial rise in Brazilians

followed upon the resumption of cash payments of the Republic's coupons due this week. Brazilian Tractions have sympathised with a rise of 2 points, and Rio Trains bonds are wanted at the improved levels of 87 for the Firsts and 76½ for the Seconds. British Columbia Electric Railway stocks have been little affected by the issue of a preliminary circular to proprietors, who are now officially informed of the municipal competition with which the company is threatened. They are promised further information in due course. Oddly enough, the 1½ per cent. debenture stock has risen 2 points, from which it might appear that the market takes the view that the prior-charge is safer than before. The yield, of course, is good, being nearly 7½ per cent. allowing for accrued interest in the price. Canadian General Electric at 119 are 2½ higher.

Cable prices mount day by day. The investor is keen upon getting any of the good-class descriptions, and, of the more speculative, West India and Panama continue their giddy advance, at 32s. 6d. showing another jump of 3s. 9d. The First Preference are 5s. up at 8, and the Seconds are equally better at 7. Globe ordinary and preference have recovered more than their dividends. Both Eastern and Western groups have hardened. The same story is repeated amongst manufacturing shares. Telegraph Constructions are £1 up, plus the dividend deducted last week. Callenders have put on another 5s. Those stocks which show no notable changes are really stronger, because there are many buyers and hardly any sellers. Marconis are quiet, though the Marines at 18s. 9d. have improved a little.

Rubber shares remain firm, and base-metal issues are very steady. Armaments have slightly risen. Iron, coal, and steel issues are amongst the industrials for which there is active demand.

The British Association.—With further reference to the B.A. arrangements for this year and next, we read in *Nature* that in view of the cancellation of the annual meeting of the British Association, it has been necessary to make special arrangements for carrying on the Association's current work. Meetings of the Organising Committees of the various Sections, the delegates of corresponding Societies, the Committee of Recommendations, and the General Committee have, therefore, been held. It has been decided to continue Sir Arthur Evans in the presidency for another year, while the Hon. Sir C. A. Parsons, who would have presided over this year's meeting, will do so at the meeting which, it is hoped, will take place as arranged at Cardiff next year. Bournemouth has repeated its invitation, which has been accepted for 1919. Grants amounting to £286 were made in aid of such researches as it was considered essential to carry on, having regard to present conditions.

Resuscitation after Electric Shock.—In the *Electrical World* of May 5th, Mr. W. P. Strickland cites another case in which a man who had received a shock on a 2,200-volt circuit was brought back to consciousness without special apparatus with the aid of mechanical shocks. The man was on the top of a pole when he received the shock; the lines were cut, and the victim was lowered to the ground, being purposely allowed to drop the last 3 ft. His body was then lifted by the heels (his head resting on the ground) and dropped. While his clothes were being loosened and his tongue drawn forward, the soles of his feet were struck vigorously with anything that came handy, and this treatment was continued during the application of the Schaeffer method of artificial respiration. Recovery was complete. In another case a man was restored to consciousness by falling from a pole.

Canada's Coal Supply.—The Canadian Fuel Controller has been given authority to investigate the amount of fuel stocks on hand, and to arrange for an equitable distribution of the supply. Coal production will be stimulated, and an effort made to establish large stocks inland before water transportation closes for the season.—*Times*.

A Cynical Conundrum.—A "Victim of Many Reconstructions" propounds the following:—"What's the difference between reconstruction and liquidation?" His suggested reply is: "Well, you sometimes get something out of the latter!"—*Financial Times*.

THE PSYCHOLOGY OF POWER-HOUSE SHIFT WORK: AN EX-SHIFTMAN'S REFLECTIONS.

By A. ARNOLD.

MUCH attention has been given at sundry times to the conditions under which men are capable of producing maximum useful work, particularly in the case of manual labour, but little note seems to have been taken of the modifications necessarily involved when provision must be made for continuous running, and hence relays of labour.

The economic results accruing from semi-"Taylorism," applied with discretion to manual and repetitive work are, doubtless, considerable; but in the average generating station—with which the writer is now concerned—there is little scope for such application, except, perhaps, to a limited extent in connection with coal and ash handling. "Taylorism," or scientific management, does not appear to have been intended for use with skilled workers, nor, indeed, is it applicable to duties involving the exercise of judgment and initiative, although the principle (of avoiding circumlocution and needless expenditure of energy, by direct methods) might well form the foundation of a course of mental training for such workers, and this would doubtless result in quicker and sounder decisions.

Power-station work is often jeered at by persons of restricted experience as being "too dull for words," a job comprised of starting up and shutting down sets and boilers to meet the requirements of the load and otherwise simply watching the clock go round—wholly mechanical, methodical, and prosaic, lacking variety, interest, or scope. Under some conditions, portions of this indictment may be substantiated, but few engineers with station experience would admit that it exhibits anything like a true picture as a whole. Practically all posts in a central station—from greaser to manager—call for more or less display of initiative and judgment, unlike factory work in general; there, quickness and manual dexterity count for more than brains, except in the higher positions. Further, the staff of a power house is necessarily on shift work, again excluding the management and higher officials, and its treatment should also be modified in view of that fact. It is fallacious to imagine that because any given person on shift work averages only a number of hours on duty similar to the total of a day-working artisan, he is therefore on an equality with the latter in respect of energy-output value, even if the actual work done in the two cases be identical.

It has been often demonstrated that "seven-days-a-week" labour is inefficient, in the sense that it involves expenditure of energy out of proportion to the increased work performed, and similarly the psychological tendency of night work is to decrease one's personal energy-output value. This is also the case in regard to long spells of duty, and is cumulative; it is usually noticeable even in ordinary day work after about six hours' duty without distinct relaxation of both mental and physical stress. At night this depreciation becomes marked in normal persons after about four hours' application, even when the "previous history" of the observed individuals is known to be good, with respect to reasonable rest and sleep; hence the interests of the undertaking, no less than those of the watch-keepers themselves, require that the duties of night shift should be kept down to the essential minimum. The policy of a few managers to set aside many detail jobs for the night staff is a short-sighted one under the present system, and is as fallacious as the execution of the innocent Admiral "pour encourager les autres."

The psychological and physiological effects due to the periodic change of shift at week-ends are frequently ignored, but their reality is unquestionable. From social and humanitarian points of view such periodic changes are imperative; also the utilitarian advantage of giving experience in all duties to each individual demands it, in order to produce a strong staff and one able to meet possible depletion by illness or disaffection. Nevertheless, physiologically these changes do harm; they disturb the health, and hence

deteriorate the coolness and emergency value of everyone affected by them. The psychological effect is not so simple. Changes are beneficial, in so far as they prevent stagnation (or more properly, "vegetation," to pervert a word), and they promote interest and concentration, and sometimes competition and emulation; in so far, however, as there is usually a favourite and also a very strongly disliked shift, the anticipation of the approach of the latter, and the reflexive, but probably unconscious relaxation of effort when it arrives, is only partly off-set by the good effects of the expectation of the better shift to come.

Power station shift systems vary but slightly in the British Isles, and the variations are usually of local origin. Anyone who has attempted to alter a shift list (or "watch-bill," in sea parlance) so as to obtain improved conditions without bringing in extra assistance, knows that inevitably the existing scheme is found to be the best under the prevailing conditions, except possibly in some very minor detail: this is only to be expected, as the present system is a product of gradual evolution. No further big improvement can be expected without very drastic alterations, but probably the time is now ripe for such.

A semi-ideal system of shifts might be similar to that in vogue at sea—a short watch of, say, four hours, followed by an interval of at least eight hours and preferably longer; but the interim should be entirely free, and not, as is usual, partly occupied by concern for some specialised department. This system, with, say, a 48-hour break every fortnight, would be physiologically as nearly healthy as possible, having regard to the necessity for a periodic change of shift. It would be, however, quite impossible ashore, on account of the time taken in the journey to and from the works, which would, in effect, be just doubled as compared with the existing eight-hour shifts, and, further, it would lead to times of starting and leaving work which would not fit in at all with the general conventional scheme of things.

The system at present in operation suffers from obvious disadvantages. Night shift is longer than is physiologically desirable or even economically defensible, particularly as in most cases the preparation for, and the picking up of, the morning load comes upon the latter end of this shift, just when vitality and energy are at their minimum. Further, as watch-keepers are but human, it must not be supposed that the beginning of this shift coincides with the commencement of the individual's day: it seldom or never does. All the world takes its pleasure and social recreation in the evening hours, and so the increased activities demanded in the latter hours of the night shift find the *personnel* more fit for bed than for a display of the brilliance to be expected of "the embodiment of all that is best in British engineering manhood."

The week-end system is also faulty. It is recognised even by the worst type of official that a regular break, say every three weeks or a month, is essential to every individual, that he may maintain his sanity, fulfil social obligations, and obtain necessary change and rest. In probably 95 per cent. of British power stations there are no reliefs in regular routine—a state of affairs which can only be excused during war time, but which is now only a little worse than prior to it. As a consequence, for a person to obtain this minimum recreative opportunity he must pay for it (in hours worked) during subsequent week ends, while his colleagues enjoy by rotation their respite, also duly paid for. Now, in all engineering works there are repair jobs and alterations which can only be carried out at times of light load: these are done at week-ends, and are accomplished by, or under the direct supervision and responsibility of, an engineer who is working 12-hour or longer shifts after a normally fatiguing week—not a very fair arrangement, either to him or his work. This applies more particularly to the engineers-in-charge of shifts: but in a general way, long hours are also demoralising to all engaged in week-end work, for they give some foundation for the "long-suffering martyr" feeling so easily aroused amongst those working unusual hours.

In cases of illness it is usual under the present system for the two remaining men of the affected grade to work 12-hour shifts. Only a few longer-sighted engineers have arranged their staffs so that reliefs can be found, and still

fewer have carried out the scheme in its entirety, so as to include chargemen as well as stokers. Twelve-hour shifts under modern conditions are demoralising—physiologically, psychologically, and economically; the undertaking which allows them is laying up big possibilities of trouble. Practically all preventible accidents are the result of overstrained physique or mentality, both of which are indubitably brought about by long shifts amongst other causes, hence the danger. It is beginning to be realised, too, that men are not mere machines, and, further, that to obtain the best results, employers must be at least as solicitous for their welfare and decent treatment as they are as to the precise minimum remuneration which can be offered. In another decade it is possible that an employer permitting 12-hour shifts will be liable to salutary penalties.

In view of these matters, it is obvious that at least four men of each grade should be employed, except where it may be possible to provide "double-utility" relief men. The latter, however, although usually only the most intelligent qualify, are often very averse to being employed thus, and, in the lower ratings at least, their colleagues are apt to resent it also. Whether this is but a passing phase remains to be seen.

The question of expense will, of course, be raised in opposition to this suggested increase of staff. Yet, if the extra wage bill were translated into terms of pence per unit generated or percentage decrease in available profits, it would be seen to be almost infinitesimally small as compared with the increased efficiency of the staff employed and their consequently enhanced value.

It is difficult to foresee at all clearly the position of electrical undertakings, after the conclusion of peace, with regard to staff. The relaxation of military authority, and the apparent cessation of the necessity for self-discipline, will greatly affect the labour market. Skilled men will only be available on their own terms, and they will not willingly enter shift work. Although the present staffs of stations throughout the country have shown splendid loyalty both to their employers and their country, by sticking to their posts when khaki was immeasurably more popular, they are now thoroughly unsettled, and a "General Post" is quite certain when the present restrictions as to movements are withdrawn. Their loyalty to their employers deserves emphasis, in the writer's opinion, and was well shown by the apparent collapse of the A.E.S.E. when that body began to meditate militant tactics.

Now, therefore, is the employers' opportunity to formulate and publish schemes whereby the present anomalies of the shift system may be smoothed out—eradicating they can never be. In the long run, the employers will be gainers by taking the initiative in this matter, and they will attract the better type of men, and form stable, loyal staffs.

The future commercial greatness of this country will be greatly aided by adequate, cheap and reliable supplies of electrical power, and the reliability depends very largely upon the staff engaged and their conditions of employment, having in view their peculiarly trying hours and the onerous duties and responsibilities devolving upon them.

TRADE STATISTICS OF SOUTH AFRICA.

THE following statement, showing the imports of electrical and similar goods into the Union of South Africa during the year 1916, has been taken from the recently-issued official trade statistics. The figures for 1915 are added for purposes of comparison, and notes of any increases or decreases are given:—

	1915.	1916.	Inc. or dec.
	£	£	£
<i>Brass manufactures.—</i>			
From Great Britain ...	19,000	24,000	+
" United States ...	—	2,000	+
" Other countries ...	2,000	2,000*	—
Total ...	21,000	26,000	+

*Mainly India.

Copper, plate and sheet.—

From Great Britain ...	4,000	4,000	—
------------------------	-------	-------	---

	1915.	1916.	Inc. or dec.
	£	£	£
<i>Copper manufactures.—</i>			
From Great Britain ...	3,000	3,000	—
" United States ...	—	1,000	+
Total ...	3,000	4,000	+

Electrical cable and wire.—

From Great Britain ...	102,000	228,000	+
" Italy ...	1,000	1,000	—
" United States ...	8,000	5,000	—
" Other countries ...	1,000	3,000*	+
Total ...	112,000	237,000	+

*Holland £3,000.

Electrical fittings, including posts.—

From Great Britain ...	125,000	200,000	+
" Germany ...	3,000	—	—
" Holland ...	11,000	22,000	+
" United States ...	37,000	62,000	+
" Other countries ...	6,000	14,000*	+
Total ...	182,000	298,000	+

*Denmark £4,000.

Lamps and lampware.—

From Great Britain ...	15,000	28,000	+
" Germany ...	1,000	—	—
" United States ...	12,000	19,000	+
" Sweden ...	3,000	17,000	+
" Other countries ...	1,000	2,000	+
Total ...	32,000	66,000	+

Electrical machinery.—

From Great Britain ...	110,000	112,000	+
" Germany ...	4,000	—	—
" United States ...	59,000	63,000	+
" Other countries ...	5,000	5,000*	—
Total ...	178,000	180,000	+

*Mainly Sweden.

Cranes, elevators, and lifts.—

From Great Britain ...	18,000	17,000	—
" United States ...	2,000	2,000	—
Total ...	20,000	19,000	—

Mining machinery.—

From Great Britain ...	368,000	473,000	+
" Germany ...	2,000	—	—
" United States ...	240,000	253,000	+
" Other countries ...	3,000	3,000*	—
Total ...	613,000	729,000	+

*Sweden £2,000.

Machinery not specially mentioned (other than agricultural, manufacturing, &c.).—

From Great Britain ...	201,000	256,000	+
" Germany ...	5,000	2,000	—
" United States ...	43,000	59,000	+
" Canada ...	3,000	6,000	+
" Other countries ...	3,000	5,000	+
Total ...	255,000	328,000	+

Telegraph and telephone material.—

From Great Britain ...	8,000	8,000	—
" Sweden ...	2,000	2,000	—
" United States ...	1,000	—	—
" Other countries ...	—	1,000	+
Total ...	11,000	11,000	—

Tramway rolling-stock.—

From Great Britain ...	21,000	10,000	—
" United States ...	4,000	2,000	—
" Other countries ...	—	1,000	+
Total ...	25,000	13,000	—

Other tramway materials.—

From Great Britain ...	5,000	2,000	—
" United States ...	2,000	2,000	—
" Other countries ...	1,000	1,000	—
Total ...	8,000	5,000	—

In addition to the above the following goods were imported as "Government Stores":—

Brassware.—

From United Kingdom ...	1,500	4,000	+
-------------------------	-------	-------	---

Copper, plate and sheet.—

From United Kingdom ...	14,000	6,000	—

DETERMINING PHASE ROTATION.*

By W. V. LYON.

FOR determining the phase rotation in a three-phase circuit, that is, to ascertain whether or not the line voltage between mains 1 and 2 leads or lags the voltage between mains 2 and 3, the writer has found the scheme shown in the accompanying illustrations useful and convenient. It consists of a non-inductive resistor and a low-resistance reactor of the same ohm value connected in series between two of the mains. The magnitude of the voltage between the third main and the junction of these two units indicates the phase rotation. Mark the mains 1, 2, and 3 as in fig. 3. Connect the free terminal of the resistor to main 1 and the free terminal of the reactor to main 2. Measure the voltage from their junction to main 3.

FIGS. 1 AND 2.—VECTOR RELATIONS OF VOLTAGE FOR LEADING AND LAGGING CONDITIONS.

FIG. 3.—CONNECTIONS OF RESISTOR, REACTOR AND VOLTMETER.

If this voltage is approximately 37 per cent. of the line voltage, the voltage between mains 1 and 2 leads the voltage between mains 2 and 3. If the voltage is approximately 137 per cent. of the line voltage, however, the voltage between mains 1 and 2 lags the voltage between mains 2 and 3.

The proof of this fact is simple. Refer to figs. 1 and 2. Assume that the line voltages are equal. The interior angles of the voltage triangles are then 60°. Any ordinary unbalancing of the line voltages would affect the voltmeter reading but little. The current should be at least ten times as much as the voltmeter takes on full scale deflection. If this be the case the voltmeter will read not more than 2 per cent. less than the stated values. In the proof it is assumed that the voltmeter current is negligibly small.

Let V_{12} lead V_{23} as shown in fig. 1. If the resistor and reactor have the same resistance value in ohms, the current will lag the voltage from 1 to 2 by 45°. The voltmeter reading, v , will be—

$$v = (0.866 - 0.50) \times \text{line voltage} \\ = 0.37 \times \text{line voltage}.$$

* From the *Electrical World*.

If V_{12} lags V_{23} as shown in fig. 2, the voltmeter reading is—

$$v = (0.866 + 0.50) \times \text{line voltage} \\ = 1.37 \times \text{line voltage}.$$

In order that the device may be used on circuits of different voltages switches should be provided as shown in fig. 3. For example, when it is to be used on a 220-volt circuit the switch marked 220 volts should be closed and the other two left open. By properly choosing the ohm values of the units, the current may be kept constant and the same accuracy obtained at the different voltages without excessive heating loss.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Induction Methods of Fault Localisation.

With reference to the letter from "North Staffs." in your last issue, to pick out a faulty cable at draw boxes, the triangle is more conveniently replaced with a fork, in accordance with the accompanying sketch.

A switch in the telephone circuit, by making and breaking the current to the receiver, more readily distinguishes the sound produced by the induction coil from any extraneous noises.

H. E. Blake.

Eastbourne, July 7th, 1917.

A Revelation Concerning the Ways of Reviewers.

In a recent review of a book in an electrical journal that shall be nameless, the reviewer apologises for the tardiness thereof with the plea that "he got interested in it, so that instead of reading merely the introduction and contents pages and basing his review on these, he read it through and forgot he was a mere reviewer."

These remarks, quite obviously made in all seriousness, will be received with mixed feelings by those whose misfortune it is to be authors, by publishers, and by a large body of readers who look for enlightenment and guidance in reviews.

Comment seems hopeless, unless other people will take up the cudgels.

W. Perren Maycock.

West Norwood, S.E. 27, July 14th, 1917.

[We fear our correspondent's sense of humour has been caught napping in this instance. The remarks in question, to our mind, we "quite obviously" facetious, and the reviewer happens to our knowledge to be conscientious to the last degree, one who is more likely to read the chapter headings, index, and advertisements in addition to the text than to follow the practice to which he playfully alludes. Moreover, he has made a special study of the subject of the work in question—that is why he was asked to review it.—EDS. ELEC. REV.]

Water-Power Proposals.

Your remarks on the development of water power in your issue of the 6th inst. are most opportune, and I trust now that the matter has been raised that the existence of available power will be realised by an authority that will be competent to carry out the necessary schemes for its development.

I am a native of North Wales, and am acquainted with many suitable sites which deserve attention. My playmate when a child was a stream that ran through my father's farm, and a noisy Scotch turbine provided daily enjoyment to me as it operated the barn and dairy machinery. The hero of those days to me was the man who had charge of that rough but serviceable plant.

In later years my father moved to a larger farm—a noted dry one. I was at that time but a youngster, but great was my joy when I realised that one of his first objects was to provide an irrigation system for the whole farm, together with two turbines for power purposes. To go with him on levelling and surveying expeditions, and laying out water courses, was the greatest pleasure that could be experienced. Never shall I forget the day when the water was turned on to the turbine for the first time.

Unfortunately, my father did not combine his knowledge of engineering and hydraulics with that of the law, the result being that he was legally involved over the question of riparian rights. He lost his case from the legal point of view, but his engineering abilities came to his aid, and he has been able

to maintain the supply to the present day. The installation to-day, after 27 years' use, stands as an example of practical engineering and a monument to the properties of the laws of this country.

For the last 15 years one of the turbines has been coupled to a generator, this being the first electric lighting plant installed in the district.

Since that time I have been interested in several small hydro-electric plants, having made a hobby of that branch of engineering, and devoting my yearly vacations to exploring possible power schemes for farm and village supply.

I consider Mr. Britton's opportunity a magnificent one, and I sincerely hope he will be able to carry his ideas to a successful issue.

The Dee, to which he intends devoting special attention, is but one instance. The Clwyd and Conway in their upper reaches have scores of localities where plants of from 20 to 200 kw. could be installed. The rivers of Snowdonia, with their high falls, are rich in possibilities. Blaenau Ffestiniog is an instance of wasted power; in fact, the waste is to be seen on every hand throughout the Principality.

A source of power which has appealed to me is that of relief stations on the pipe lines of our town supplies, and the surplus waters at our reservoirs. The Vyrnwy and Rhayadr works are instances. At both these reservoirs a considerable quantity of compensation water is allowed to flow, and very large volumes flow over the sills during the winter months. Instead of allowing this to run to waste, why not allow it to flow along the pipe line to the utmost capacity, and at its highest load factor, and utilise it at suitable points along the route? Why not allow Mr. Britton, for instance, to tap the Vyrnwy line at a point near Chester, utilising surplus water at that point, and at the same time augmenting the supply to his existing station lower down? In the case of the Rhayadr works the same applies, the supply being given to small towns and villages *en route*.

Another instance is the new Birkenhead waterworks. In this case turbines could be fixed at such places as Llanfihangel, Clawdd Newydd, and Ruthin. Again, after crossing the Clwydian Range, if any further supply is available it could be utilised on either side of the Dee, as found necessary.

The question arises as to how these developments are to be carried out. I doubt if a private company can be formed to undertake the work, owing to the hostility of riparian owners and holders of sporting rights. The alternative is for the Government to form a Department of National Power Supply to take charge of all our water power, and to control its development. This could be extended to the smallest plants, even where electricity is not generated. Small installations could be installed on hire-purchase systems, and in the case of larger ones licences could be granted to companies and local authorities to develop them under national control.

In this way encouragement would be given to farmers to extend the use of power on their farms, it would lessen the drudgery of farm work, and generally increase the yield of our land. Our villages would be brightened, not only from the illumination point of view, but from a social standpoint. Industries requiring small power would be established along our countryside, and the cry of "back to the land" would at last become practical.

The North Wales Power Co. has done pioneer work in this direction, but its progress has not been very marked. I am not acquainted with the conditions responsible for its apparent failure to compete with the steam stations at Carnarvon and along the North Wales coast, but it most probably can be accounted for by wayleave and other difficulties, together with, most probably, a certain amount of parochial jealousy.

All these difficulties would be overcome by a national system possessing compulsory powers of expropriation.

Thomas Smith.

Wolverhampton, July 10th, 1917.

The Salaries of Central-Station Officials.

The table of average salaries of central-station officials given in this week's REVIEW is particularly interesting in the poor comparison they make with the salaries of leading officials in other professions. In nearly all municipalities the town clerk receives quite twice the salary of the electrical engineer. In these days this is surely absurd. In the Army the engineers have long been the most highly paid branch, and in the majority of circumstances the R.E. officer takes command. In these days, when cheap and reliable power is the life-blood of a nation, it is surely time that the electrical engineer topped the lawyer in salary. The achievement of this is also, I should like to suggest, an engineering problem (in an introductory note by Dr. Thurston to Rowan's "Practical Physics of the Steam Boiler," the following passage occurs: "The engineer, it will be seen, is also a high order of financier"). I wonder if it is high finance to suggest that, as the chief's salary must always bear a certain ratio to his assistants', his own may be automatically "boosted" by boosting his assistants'?

Assistant.

Accident.—On Friday at the Yorkshire Electric Power Co.'s works at Thornhill, two workmen aged 61 and 59 respectively, in the employ of Messrs. Firth & Co., of Burton-on-Trent, who are engaged upon the contractor's work in connection with the extension scheme at the power station, came into contact with a live wire and received a shock while working at a crane. Both were in a critical condition, suffering from burns on the feet and hands.

It is common with all peoples at all times, we are prone to assume that our own problems of the moment are original in their character, and more far-reaching in their significance than those of any other times or other peoples. We hear much of industrial unrest and of class antagonisms, and the gravity of such unrest at the present time, as well as the importance of its removal, deserves the closest attention of all who are desirous for the welfare of the State. The Parliamentary Secretary of the Board of Trade, Mr. G. H. Roberts, M.P., has expressed the view that: "If the old disputations remain, if employers and employed are ranged in conflicting camps, the ravages of war will not be repaired, reconstruction will be impossible, and, as sure as morn follows night, so will the decline and fall of the British Empire set in."

Now, the disputations of Capital and Labour have always existed, and, unhappily, the idea of antagonism of interests, though early combated, has not been eradicated. Harrington says in his "Oceana," which was first printed in 1656: "It will be convenient in this place to speak a word to such as go about to insinuate to the nobility or gentry a fear of the people, or to the people a fear of the nobility or gentry, as if their interests were destructive to each other." He indicates that they are mutually dependent. The intervening centuries have not succeeded in eradicating the idea that employer and employed must needs be in opposition, that their interests are, in fact, "destructive to each other."

It is the more interesting, then, to hear Mr. Roberts on this point:—"I have no illusions. The interests of employer and employed will never be identical any more than the principle of nationality or the interests of buyer and seller will be identical, but up to a certain point there is a community of interest."

Setting aside any philosophical or argumentative discussion as to the point where the community of interest begins or ends, there are few who will be ready to question that, for practical purposes, Mr. Roberts's statement is sufficiently accurate. And the problem of the moment is how to obtain a fair settlement where interests differ, and a recognition of points where interests are identical.

The differences of opinion are generally to be found in regard to the division of the cake to the exclusion of a recognition of the mutual advantage of producing as large a cake as possible. The disputations have centred about the former with, too often, an acrimonious attribute which has prevented a recognition of the utility of the latter.

How, then, can a new frame of mind be brought about whereby either side may approach the problems with knowledge of and sympathy with the other's case? Clearly, as we have said many times, the most effective means is to "get together." And it has happily occurred to some practical minds to form an "Industrial League for the Improvement of Relations between Employers and Employed." It was at a meeting of this League that Mr. Roberts made the remarks we have quoted. He also said:—"The working classes are very nervous and suspicious. When you tell them of a movement such as ours they say it is only another capitalistic dodge, another device

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C. 4.

Telegraphic Address: "AOEREKAY, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 8d.; Canada, £1 8s. 10d. (\$5.80). To all other countries, £1 10s.

4, Ludgate Hill, London, E.C. 4.

for keeping them quiet so that the employing and possessing classes may pursue their policy of exploitation. We have to allay that suspicion. Employers have to show that they recognise the rights of the workers and that the old mean rates of wages have to pass away."

Here, it seems to us, is the crux of the problem. Industrial unrest at the present time need be no matter for surprise. It may be sufficiently explained by the tension common to us all. But industrial mistrust, though perhaps intensified by the existing rarefied atmosphere, is not a new feature. If the Industrial League and the many authorities who are earnestly working to secure harmonious co-operation can do anything to remove that mistrust, they will deserve to rank amongst the benefactors of the nation.

Why London? SINCE 1914, when the outbreak of war caused what has turned out to be a prolonged diversion of the normal current of affairs, it has become a habit amongst certain societies to hold their annual meetings in London.

Why this should be so we do not know; London is not centrally situated for the majority of provincial members, its hotels and assembly rooms have been largely commandeered, and, in any case, to those who are interested in such, it can show no industrial developments such as may be found in the provinces. There is a want of cohesion amongst the visitors to a London conference, which is apt to breed disunity and lack of interest; in the result the only opportunity for mutual intercourse on the part of provincial visitors is frequently lost. This has been the case for three successive years with the Municipal Electrical Association, and we venture to suggest to the new President, Mr. S. J. Watson, that a change to some progressive electrical centre, such as Manchester or Sheffield, would be welcomed by many of the members, who would have an opportunity of seeing for themselves what they can only vaguely talk about in London.

Propaganda in Spain. A prominent feature of the state of affairs that has prevailed in Spain during the war has been the widespread and very characteristic work of German propagandists. It is well known that Germany has nursed Spain electrically, and by means of a very extensive organisation, very effectively for years past. Nobody knows what may be the outcome of the war in that very much disturbed country. But, whatever may be the course of events, the influence of the German agent, revealed or unrevealed, will have to be seriously reckoned with if we intend to secure a more reasonable share of electrical and engineering trade there. It is of the greatest importance that attention should be paid to this question of propaganda, whether carried on from Great Britain direct or conducted indirectly through individual joint representatives in Spain. All literature and correspondence must be prepared in Spanish, which is also the language of Mexico, and of all the States in South America, except Brazil. The study of Spanish under the circumstances should be widely cultivated, as it is indispensably necessary in order to promote our export trade with Spain and South America. Our French friends are advocating the undertaking of educational work of this nature in the commercial and high schools for the purpose of developing business with Spain, and we should not be backward in learning what is really a simple and beautiful language, which can be easily acquired, particularly by those who are acquainted with French.

So great and so manifest are the **Off-peak Loads.** advantages of off-peak loads to electricity supply undertakings, that it is a matter for surprise that they have not been more assiduously sought and cultivated in the past, at any rate in this country. However, we are going to turn over a new leaf in the future—the near future, we should like to say—namely, when peace returns, and we all take a long breath and look round to see what the next job is to be. Not only shall we push on with the reform of our system of generating and distributing electrical energy, of which it stands, sadly in need; we must equally accelerate the growth of the demand in directions tending to improve the load factor, not by the slow methods of evolution, but by leaps and bounds.

To this end, the experience gained in the war will prove of immense assistance; the infinite flexibility and universal applicability of electrical energy have been abundantly demonstrated, new and unexpected uses have been found for it, new industries have been created which require its services, and new conditions have arisen which will profoundly modify the progress of electricity supply. Not least amongst these factors must be numbered the developments which have taken place with regard to electrochemistry and electrometallurgy. We have already drawn attention to the rapid advance of the electric steel furnace, which has now firmly established itself in favour by merit; the electric furnace has innumerable other applications, and lends itself to designs of the most diverse characters, such as the nitrogen furnace of Mr. E. Kilburn Scott, which is dealt with elsewhere in this issue. Some of these uses, and notably the last-mentioned, are particularly welcome to station managers, as they can be arranged to fall entirely within the off-peak period, and thus enable the supplier to improve his load factor. Another opening of this kind is indicated by an engineering contributor in this issue—the driving of refrigerating plant, which is still more grateful to the heart of the supplier in that it attains its maximum demand in summer time. The supply of power to farms also possesses this merit, though in less degree. Charging the batteries of electric vehicles is going to be a very valuable aid in off-peak hours, when the manufacture of such vehicles is freed from the restrictions at present necessarily imposed upon it. The manufacture of bleaching fluid by electrolysis, which is discussed on another page, may not attain to similar dimensions, but can certainly be cultivated as an off-peak load.

Many other items could be added to the list. Our purpose, however, is not to schedule every possible example, but to draw attention "right now" to the importance of due preparation, in three particulars: (1) The education of the public to the infinite possibilities of electricity as an aid in their businesses; (2) the instruction of the staffs of electricity supply undertakings as to the requirements of their business and the opportunities which lie before them; and (3) the provision of suitable tariffs for guaranteed off-peak loads, easy to understand, and attractive by virtue of their cheapness.

It is not enough to announce that electrical energy is on sale for all purposes; steps should be taken to tell the people for what purposes it can be used, how to set about using it, what it will cost, &c. We have recently given a number of examples which show that the use of electricity does not merely lead to economy in itself (it may even happen that the energy costs more in the electrical form)—it often effects economies of labour and improvements in quality and quantity of output that are totally unexpected, and are found to be surprisingly great. Nearly all the trumps are in the hand of the electricity supplier—let him play his cards well, and he must win!

ELECTROLYSERS AND THEIR MANAGEMENT.

By ERNEST REUSS.

THE increase of recent years in the use of electrolyzers is undoubtedly due to growing confidence on the part of users, and a greater willingness on the part of men entrusted with their management to take an interest in, and learn something of, a new process.

The successful manipulation of electrolyzers demands at the outset the same amount of observation and study as is called for in any other manufacturing process; a few hints as to the nature of the problems to be encountered may therefore be useful.

Temperature plays a leading part. The passage of a current of electricity through water engenders heat, the addition of salt increases the conductivity of the water, more current passes, the raising of the brine temperature still further increases its conductivity, consequently the tendency to heat is further increased; these are problems to be contended with in the working of electrolyzers, which are liable to be aggravated by a changeable climate.

The best temperature for electrolysis has been found to be 25° to 28° C. If this be exceeded, a falling-off in chlorine production is noted; and if the temperature be allowed to exceed 35° C., there is an actual loss in the chlorine made, which is either driven off or converted into chlorate, useless for bleaching or sterilising.

Again, if the temperature of the electrolyte be too low, as in frosty weather—say, 0° C., or even 5° C.—electrolysis hardly takes place, electrolytic decomposition is retarded. When the temperature of the brine is raised—say by a steam coil—rapid electrolysis commences, as evinced by the smell of chlorine given off. Users of electrolyzers should, in cold weather, bring up the temperature of the brine to, say, 25° C. before commencing electrolysis; it saves current and time.

In hot weather the control of temperature requires some attention; but before discussing this subject, it should be stated that there are two distinct types of electrolyzers in use—the “constant flow” and the “circulating” types. In the former, the liquor runs once through and is ready for use; but it is weak in chlorine, and mainly suited to laundry and sanitary work. This form of electrolyzer is, however, fairly cheap to construct, and there are a number in use bleaching textiles and paper.

The only means of increasing the chlorine strength in the “constant flow” system is:—

1. To employ stronger brine (causing more amperes to flow).

2. To increase the area of the electrodes, or to combine both methods (this is already done in the largest patterns of this type).

3. Reduce the speed of brine flow, allowing more time for the current to do its work.

The hindrance to the development of this type of electrolyzer is, that the limit of temperature has already been reached.

Refrigerating within the electrolyzer was long ago attempted and abandoned on account of its complications and the formation of scale, mentioned later, with the attendant difficulty of its removal.

The “circulating” type was the outcome of the attempts made to solve the problems involved when it was attempted to increase the chlorine strength in the earlier types.

To counteract the rising temperature, refrigeration was resorted to. In the Schuckert type, a coil immersed in running water is placed below the electrolyzer, and the brine in process of electrolysis is circulated by a pump through the coils. In the Oertel type the process is reversed; the electrolyzer is placed in a generating tank, in which there are two or more refrigerating coils, through which the water flows by natural fall.

The circulation of the brine through the electrolyzer is automatic, being effected by the effervescence caused by the liberation of the hydrogen gas in the electrolyzer, which raises the level of the liquor in the cell some $\frac{3}{4}$ in., when it overflows naturally and briskly.

This system avoids the cost of driving the pump, together with its frequent repair, and the gradual loss of efficiency due to the furring-up of the coils with a deposit of scale, which cannot be got off, otherwise the output of both systems is about the same, for salt and current employed.

Control of temperature is effected in the “constant flow” type by accurately mixing the brine to a given standard, the only effective test being the hydrometer. Mixing by weight is fallacious, as salt in damp weather rapidly gains weight (and here again a note of warning is called for; the best salt for the purpose is the rough crystal variety, as used for fish curing; if rock salt is employed, containing 15 per cent. or more of clay, the density of the brine will be somewhat affected).

The rate of flow through the electrolyzer is regulated by a tank provided with float feed giving constant pressure, also by a check valve allowing of the passage of a measured quantity of brine per hour.

Should the temperature rise in summer beyond these controls, there are two methods of checking it, either by reducing the density of the brine (causing less to flow) or by increasing the rate of flow of the brine, the former being the most rational and cheaper method.

In the “circulating” type, the temperature is ordinarily controlled by the cooling coils. This suffices in England;

VARIATION OF CHLORINE PRODUCTION WITH TEMPERATURE.

in hotter countries, the number or area of the coils may be increased, the strength of the brine may be reduced, or the water itself may be artificially refrigerated (by no means so expensive a process as has sometimes been asserted).

In connection with the water supply, means should be employed to keep the pressure constant; a diminished pressure means reduced flow and a rise in temperature. The use of a reliable and sensitive thermostat is strongly recommended, capable of checking a rise of 2° F. in temperature. The adoption of these thermostats in electrolyzers has been one of the most notable improvements effected since electrolyzers were introduced, comparable only to the use of a good governor on an electric light engine, as varying temperatures were accountable for most of the troubles in connection with the running of electrolyzers; but, as with automatic cut-outs, it pays to secure the best type procurable.

The accompanying chart illustrates the effects of irregular temperature on chlorine production; A is the ideal chlorine curve, corresponding to steady electrical current and perfect water control; B is the actual curve, showing the faults due to irregular temperature; C is the temperature line.

At first, chlorine production is very slow, due to low temperature. As soon, however, as 20° C. is reached the curve rises rapidly, but it is then arrested by excessive temperature, when some of the chlorine made is doubtless lost;

at this point water was turned on, and as soon as the brine had cooled down again normal chlorine production was resumed, but the total production in 12 hours only reached 10.5 grammes per litre, in place of 12 per 10 hours, which it should have been, or 14 grammes under ideal circumstances (14 grammes per litre corresponds to the performance of a steam boiler using best coal, carefully stoked, with flues recently cleaned; the writer recently, working under very favourable conditions, produced 13 grammes in eight hours).

Another point not generally known adversely affecting chlorine production is bright sunshine in hot weather. The electrolyser whilst at work in the summer should have the bright light screened from it (in hot climates totally excluded), and the liquor as soon as made run into the storage tank, which is closed to light and the atmosphere. As warm liquor keeps badly, it might be advisable after completion of electrolysis to continue the circulation of cold water until the liquor is chilled to 20° C., or, even better, to 15° C.

Another method of improving the stability of the made bleach is to render the liquor distinctly alkaline by the addition of caustic soda in the storage tank; but this requires an appreciable quantity of caustic, and is otherwise not advisable, as it makes bleaching very slow, and introduces the old irregular bleaching action that electrolytic chlorine is intended to obviate. If loss is to be avoided the bleach should be employed as soon after making as possible, the ideal method being to prepare it overnight, and use fresh in its highest state of perfection next morning; this is practicable where an efficient thermostat and a sensitive cut-out, both of the best makes, are in use, as if current and temperature are constant electrolysis will be perfect.

Cleansing.—No water is pure—it holds carbonates and sulphates of lime and magnesium in solution. Salt, particularly rock salt, contains both these minerals, which are deposited on the *positive* side of the electrodes in the form of scale, which, if not promptly removed, causes serious trouble and loss of efficiency, which is easily increased if the brine is turbid through being mixed or stirred just before use; if the brine holds clay in suspension, cleansing may be very difficult, as it sticks like paint. The removal of scale is, fortunately, very simple; reversal of the current loosens the scale, as hydrogen gas is generated between the face of the electrode and the scale, loosening it; it is then easily washed off by a powerful snicing with a hosepipe. Usually this washing is done in a perfunctory manner, and sufficient care is not taken to see that the circulating passages are kept open. Sometimes the scale is very hard, and falls off in flakes, which require breaking up with a steel rod; at other times it comes away in grains resembling old mortar. If the passages are blocked, experienced observation of the diminished flow will show where to locate the trouble. Scale, and particularly a coating of clay, impedes the passage of the current by insulation, and naturally greatly diminishes the chlorine output.

New electrolyzers do not show their maximum output for the first day or two; it takes time for the electrodes to become saturated with brine and for certain impurities to be eliminated. On the third day of running, it is very advisable to take hourly records from starting up, for future reference, of volts, amperes, temperature, and chlorine yield. Thereafter, one or more observations a day, compared with the standard chart, will indicate any falling-off, when the cause should be sought; a drop of a few volts will affect the amperes considerably. This will affect the chlorine yield and also the temperature; if the brine is too weak, the amperes will be down.

A brisk circulation during the first few hours shows everything is right; a sluggish circulation denotes something wrong—electrodes dirty, passages choked, &c. The electrolyser, practically, *cannot* go wrong beyond righting, unless the electrodes are worn out, and they should last 18 months' day work, always provided that they have not been overheated, which makes them spongy, when they waste.

The electrolyser should be washed and wiped down daily to remove the salt crusts carried by the spray all round,

which would in time cause leakage of current, and this applies to the exterior foundations, which are all the better for a few coats of bitumastic varnish, to prevent absorption of brine, an excellent medium for carrying current to earth.

Electrolysers are employed to-day for bleaching every class of textile fibre, and the bleached article, whether sewing thread or cloth, shows from 8 to 10 per cent. better breaking strain, due to the bleaching liquor distributing itself more regularly among the material; being quicker in its action, it should be used weaker. Its level work is quickly appreciated by dyers. Excellent results are also obtained in laundries. Hospitals and asylums are well satisfied with the electrolyser as a steriliser. Manufacturers troubled with foul reservoirs or mildew among goods in course of manufacture, and with evil-smelling water, have found relief by the adoption of the smallest electrolyser made.

Quite recently a firm of flannel manufacturers, whose reservoirs were so choked with weed that it was impossible to draw a rake through, cleared them completely in 10 days at a cost of 1s. 6d. per day, and this without any nuisance or interruption to their working; nor were the fish killed. As a proof of their satisfaction, they have expressed their willingness to answer any inquiries addressed to them. The same size of electrolyser employed for sterilising drinking water would be capable of dealing with 200,000 gallons a day, which is represented by a volume of water measuring 80 ft. x 50 ft. x 8 ft. deep.

A GOOD SUMMER LOAD.

By "RESEARCH."

SUPPLY authorities all want a consumer who will take a good deal of power in summer and very little in winter. It is doubtful if many of them realise the benefits to be derived from pushing the use of refrigerating plant. Most of this plant is at present steam-driven, and it is up to the electrical industry to see that the steam engines are replaced by electric motors. Also this type of plant is not nearly so extensively used as it might be, and the advantages of such plant could be laid before the right people by motor manufacturers and supply authorities. Who are the right people?

Butchers.	Dairies.	Butter factories.
Fishmongers.	Hospitals.	Dry cold air for blast
Abattoirs.	Large private houses,	furnaces,
Hotels.	Provision m ^r chants,	Fur stores,
Restaurants.	Markets,	Docks.
	Ice stores,	

What revenue are the supply authorities likely to get? Let us take the case of a butcher's shop of medium size. A 5-H.P. motor is installed, and the yearly revenue is £25. Of this sum £16 is received for the two summer quarters. The price charged per unit is 2d. The capacity of the plant is 2,000 cb. ft. of insulated space kept at a temperature of 30° F. The motor is run about six hours per day, and meat and game are kept in the ice room until required. The approximate yearly cost, apart from electricity, is about £12 for oil, ammonia, and upkeep of plant.

The working of the plant is as follows;—The motor drives a compressor which compresses ammonia gas. The ammonia is passed through an oil separator to a condenser. In this condenser the ammonia gas is condensed into a liquid, which flows into a storage tank. From this tank it passes through an expansion valve into coils of pipes situated where the low temperature is required. In these pipes the ammonia again becomes a gas, and passes back to the compressor to pass through the above cycle of operations.

It will be seen that the process is very simple, and the plant requires very little skilled attention. The capital cost is the only objection a consumer might have, and the running costs are practically only for the electricity consumed. As a nation, we have to be very careful just now that all food is utilised, and if there were refrigerators at all our docks and markets, we would not hear so much of food being sold to soapmakers or thrown away as useless.

ELECTRIC COOKING IN THE FACTORY.

DURING the last few years a great amount of thought and attention has been given to the beneficial effects arising from improved hygienic conditions in the factory. The subject is a difficult one, because the would-be reformer and the workman often hold radically different opinions as to what constitute im-

ELECTRIC KITCHEN, MESSRS. HAWORTH'S MILLS.

provements, especially if traditional methods are at all disturbed.

One direction, however, in which considerable improvement has taken place is in the provision of well-cooked food at low cost for those employees who prefer to obtain their meals in this way, and many elaborate works' kitchens and dining-rooms have come into being as a result of the realisation that improved health means a higher standard of efficiency.

An example of welfare work of this class is found in the four modern electric kitchens which have been installed by Messrs. Richard Haworth & Co., Ltd., at their mills in Ordsall Lane, Salford.

Messrs. Haworth are one of the largest, and oldest, cotton manufacturing firms in the Kingdom, and their several adjacent factories employ a large number of operatives, many of whom reside in the vicinity and obtain their meals at home or bring food with them. The supply of food, cooked in the mill, has therefore been somewhat of an experiment, though we gather that its advantages are becoming gradually recognised by the operatives, of whom about 500 are now being catered for.

Through the courtesy of Messrs. Haworth, and of Carron Company, who supplied all the equipment, we were recently able to inspect the cooking arrangements above referred to.

The kitchens are very similarly equipped, each having a large three-oven range with ample boiling and grilling accommodation, a heavy boiling

table, and hot closets for keeping food warm. The apparatus is "Carron standard," with white enamelled back plates, stove enamelled black parts, and plated and polished mouldings, &c., presenting a smart appearance, in keeping with the bright and well ventilated kitchens in which it is installed.

Each range comprises three ovens, each measuring 22 in. x 20 in. x 22 in. inside, built up on the unit principle, with top and bottom heating elements, each arranged for three heat control and loaded to a maximum of 5.5 kw.

The heaters, divided into four groups, top and bottom, are carried in shallow trays, which can be slid out for examination at a moment's notice, having pin and socket connections at the back. The heaters are built up of standard Carron porcelain bars carrying exposed heating spirals.

The ovens have porcelain enamelled interiors, doors fitted with toughened glass inspection windows and thermometers, and the interior fittings being all detachable, the ovens can be washed out when necessary.

The hot-plate over the ovens has two boiling sections—each having three intensely heated portions, arranged for suitable heat regulation—also a third simmering section, with a griller and toaster underneath, wired for 5 kw., with two separately controlled elements.

Hinged doors under the boiling sections enclose hot closets heated by the latter, and the controlling switchboards, on which are mounted three-heat rotary indicating switches, fuses, and pilot lights, are supported over the hot plate by brackets attached to the splash plate behind. Each range is loaded to approximately 32 kw.

The hot closet accommodation varies, two of the kitchens each having two 11-ft. closets, in another case an 11-ft. and a 6-ft. closet are installed, while one 11-ft. closet only is fitted in one instance.

These closets also serve the purpose of counters over which food is handed to the operatives; the closets are constructed of fine cast-iron panelling with mild-steel sliding doors, are lined with white

STANDARD CARRON RANGE AND BOILING TABLE.

porcelain enamelled sheets, and fitted with white enamelled perforated shelves. The heaters consist of groups of Carron porcelain bars carrying wire spirals, and are all interchangeable, fitted in the back of the compartment, and can be pulled out instantly, as they have pin and socket connections.

The total loading of these hot closets is 21 kw., each section being separately controlled and the connecting leads carried to terminal boxes at opposite ends, where three-heat rotary indicating switches and fuses are mounted.

ELECTRIC KITCHEN AND DINING ROOM, MESSRS. HAWORTH'S MILLS.

Three of the kitchens have 6-ft. boiling tables, while the fourth is equipped with a table half this size; both sizes are built up on the unit principle, having certain intensely heated, separately controlled areas in the boiling top; each table is mounted on heavy cast-iron feet, has a pot rack underneath, and a white porcelain enamelled splash plate and switchboard over this carrying three-heat rotary indicating switches, fuses, and pilot lights.

The large tables are each loaded to 6 kw. maximum, and the small table has half this loading. A distinctive feature of the boiling tops or hobs on Carron ranges and boiling tables—to which attention was drawn in our issue of April 6th last—is the system of intensely heated surfaces employed in place of the hot plate commonly found in such circumstances. The surfaces are heated by groups of mica insulated elements each with 300 kw. loading, which are clamped between asbestos pads and a planed surface under the top plate. These elements are connected where possible to small ribbon bus-bars at the ends, and are each clamped independently, so that the removal or replacement of one of them is a small matter, merely involving the raising of the top plate and loosening a few nuts; usually the interior connections of heating elements are of beaded nickel wire.

It will be gathered that this arrangement safeguards the working of the installation, though we understand that experience has shown, as one would expect, that it is inherently more reliable than the usual hot-plate system, and practically no trouble has been experienced with it.

At Messrs. Haworth's establishment, the workers are required to purchase checks the day before (which enables the food requirements to be estimated), which are exchanged over the counter for food, men being charged 6d., and women 4d., for a cut off the joint and two vegetables; in addition puddings, pastries, and sweets are provided at extra charges. Breakfasts are supplied, and food brought from home is also warmed up; a considerable amount of pastry is also supplied for consumption at home, and the charges are based on the bare cost, it being considered that the firm benefits indirectly from the improved health of the worker. No tea is provided in these kitchens, as the predilec-

tion of the cotton operative for that beverage at all hours of the day has long necessitated the provision of a regular supply of boiling water for that purpose in various parts of the mill.

The apparatus is run at 220 volts, being roughly balanced on the 440-volt circuits of the Salford Corporation, and, as the supply is obtained on bulk terms, the cost per unit amounts to between .5d. and .6d.

The kitchens are in charge of an experienced cook, with a staff which, apparently, appreciates the facility of electrical methods; the equipment has been in use for varying periods, and is not working at its full capacity, one kitchen having only recently been completed. Under present conditions, however, we understand that the cost of energy works out at less than one halfpenny per person per meal, including the cost of energy for kitchen ventilation.

In conclusion, we are indebted to Messrs. Haworth and to their chief electrical engineer, Mr. Forbes, for supplying many interesting details regarding the operation of this equipment; we also have to acknowledge the assiduous attention of Mr. C. McKinlay, of Carron Company, under whose aegis the visit was under-

ARRANGEMENT OF HEATING ELEMENTS, STANDARD CARRON RANGE BOILING UNIT.

taken, and our indebtedness to Mr. A. R. Wood, manager of the Carron electric cooking and heating department, for arranging the visit.

Electricity used for Driving Cattle.—It is reported that an electrically charged rod for driving cattle is being introduced upon some of the ranches of Western Texas. It is said to be specially suited for making rebellious cattle enter dipping vats, branding pens and other enclosures into which it is ordinarily a difficult matter to drive them. The rod is constructed with four dry cells and a coil and is equipped with a button by which the current may be turned on when it is desired to apply it to an animal.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

B.T.H. Ironclad Switchgear.

The BRITISH THOMSON-HOUSTON CO., LTD., of Rugby, has brought out improved patterns of ironclad oil-break switchgear for mining and industrial service. It is designed on the draw-out principle, with interlocking devices to prevent accidental contact with live metal; all parts are readily accessible when made dead by withdrawing the carriage. The switches are of the free-handle type, and have an accelerated gravity break, and double-break on each pole. They are made in two sizes, rated at 120 and 500 amperes up to 650 volts, and 50 and 120 amperes up to 3,300 volts. The larger size is illustrated in figs. 1 and 2 herewith. The switches

FIG. 1.—B.T.H. IRONCLAD SWITCH, WITH CARRIAGE WITHDRAWN, COVER OPEN, AND TANK LOWERED.

can be mounted side by side and coupled up to common bus-bars carried in connection chambers; automatic features and a time-element device can be supplied if desired.

For starting induction motors an automatic device is provided which temporarily raises the current setting, thus enabling the momentary starting current to flow without tripping the switch. Leakage protective relays, and electrical interlocks with controllers, may be employed, and provision is made for mounting ammeters and voltmeters on the switch body. We note that the dimension diagrams are figured in both inches and millimetres; metric weights and measures are also given in the shipping specification, in addition to the English units.

A Convenient Electroscopie Exciter.

The illustration, fig. 3, shows a very simple device for exciting electroscopes, and for similar purposes when a small charge of known sign is required, which has been found to be of con-

FIG. 3.—ELECTROSCOPE EXCITER.

siderable use in experimental work. The appliance consists of a smooth metal tube, A, one end of which should be closed and rounded, fixed to a varnished glass handle, B, by means of shellac.

The sharp edge of the tube should be well covered with the insulating adhesive. This fits rather loosely into a somewhat larger tube, C, also of metal, but lined thickly with fur. This may be screwed to a wooden base, D, preferably hollowed at the back and weighted with lead. The tube, A, becomes negatively charged by merely raising from the table, only one hand being required, since the base is sufficiently heavy to retain its position. An electroscopie may be charged negatively by contact with the small tube, or positively by induction. In the instrument constructed by the inventor the inner tube is the nickelled case supplied with a small stick of shaving soap, the fur being a piece of moleskin. The inventor is MR. H. J. GRAY, of Lewes.

The "Diffusa" Reflector Fitting.

This unit is designed by the SUN ELECTRICAL CO., LTD., of 118, Charing Cross Road, W.C.2, for use with half-watt lamps, and consists of a standard "Sunlite" P.E. extensive reflector fitting, having an opalescent reflector bowl suspended from it by three chains and ingenious spring clips. These clips, while securely

FIG. 2.—MECHANISM OF SWITCH.

holding the bottom reflector in position, do away with the necessity of boring the glass bowl. The bowl is so placed in relation to the top reflector that the resulting illumination is a combination of diffused and indirect light. The lighting effect is similar to that obtained with the makers' standard semi-indirect unit, but is concentrated over a slightly smaller area. The three-point suspension does away with the shadows usually thrown by ring fittings.

FIG. 4.—"DIFFUSA" REFLECTOR FITTING.

Ample ventilation is provided, there being, in addition to the opening between the top reflector and bowl, adequate ventilation holes in the neck of the fitting. This system of lighting is especially suitable for use where fine, intricate work involving great accuracy is carried out, as it does not tire the eyes.

A NEW INDUSTRIAL LEAGUE.

THE objects of the Industrial League for the Improvement of Relations between Employers and Employed were explained in a series of speeches delivered at a well-attended dinner at the Café Monico on Friday last.

Mr. Lee Murray presided, and amongst those present were Sir Albert Stanley, M.P. (President of the Board of Trade), the Rt. Hon. F. Huth Jackson, Mr. G. H. Roberts, M.P. (Parliamentary Secretary to the Board of Trade), Mr. G. Wardle, M.P. (Chairman of the Labour Party), Sir A. Denny, Sir J. McCall, Sir C. Allom, and others.

THE CHAIRMAN said that their meetings had been going on for about two years. They started with a number of men who held diverse opinions on almost every subject, and who came together to see if they could not find some means by which they could compromise, or, at all events, to find the explanation as to why they differed. The result had been that they had found that the men who differed from them were men who sincerely and honestly held their views because of their particular experience. Latterly they had concentrated on what was the second important menace that Great Britain would have to face after the war, namely, the enormous debt piled up against us in foreign countries on account of the war. That debt had to be reduced, and it could only be tackled by increased productivity, which would mean less imports and more exports. Our imports so enormously exceeded our exports that we could reduce imports tremendously without affecting our exports position at all. In order to do this it was necessary (1) to get the orders, (2) to manufacture the goods. During the last two years there had been set up in England a number of co-operative organisations consisting of different employers whose business it was to get out after trade after the war. Those organisations, strong as they were in finance, in personnel, and in technical and commercial ability, had the necessary qualifications for their work, securing new markets and increasing our trade in existing ones. They could leave to those organisations and to the individual manufacturers the task of securing increased orders. But how were we equipped for turning out the goods when the orders were obtained? He always combated the statement that our manufacturers had failed as producers; they had not done so. If they said that our manufacturers had failed to stem the aggressive competition of the Americans and the Germans then they would certainly be right. The aims of our manufacturers had been too local and personal instead of national. Since the war we had had an enormous increase in productivity in this country, and the capacity for production was greater than was ever imagined before the war, which would enable us to cope with the whole of the increased orders that we should get. The American did not hesitate to scrap anything the moment he knew there was something better to be obtained. Our manufacturers would have to do the same, and to be supported by the trade unions and the Labour people in introducing improvements when they were possible. All the endeavours of the organisations he had mentioned to get fresh orders would be rendered vain and useless unless they had a proper relationship between employers and employed, and unless they appreciated their community of interest. If the relations were to be as they were before the war, then it would not be worth while to get out for new business, but if the relations were as they should be, they would want all the orders they could get, for they would then be able to get the stuff out and fill the orders. There must be a minimum wage for every willing worker. That being conceded by the employer, he had to have the unquestioned right of sacking any man who could not or would not earn that minimum wage. There was to be payment by results. By that, every class of work that could be measured would be paid for according to the industry and the energy shown by the men engaged on it. He did not doubt that different systems would be in use in different parts of the country, but a man had to be paid what he earned. Manufacturers must keep their plant and equipment up-to-date. How they were to get the money could be left to those who were going into the industrial banking system. The workers must do everything possible to secure a maximum output. There had to be no more restrictions of output, no more "ca canny." If the men realised that their interests and those of their employers were identical they would show that their hearts were in this thing by turning out every possible ounce of stuff. The social status of all the workers must be uplifted. The employers had to be educated up to a realisation of their responsibilities. Their employes also had to be educated, and their children thoroughly educated in ideas of patriotism. Where would the Germans have been to-day but for that? The workman must not be allowed to think that he was a machine tool; that sort of thing had to stop. Another thing necessary was the encouragement of the small manufacturer. He disagreed with the view that headway could only be made through huge industrial organisations. Big organisations were necessary for the technical advancement of experimental work, because they had the finance and the facilities, but the history of England had been the history of the small manufacturer, and the small manufacturer, specialising in a few lines, had held his own against departments of the big

octopus concerns. The small manufacturer had also a great part to play in the solution of the problem of the relations between employer and employed. It was to him that they had to look in a very large measure for the propaganda work that had to be done. How could they help to put those ideas into effect, and how could they do their best to get increased productivity by improving the relations between employers and employed? Those were the questions they had to ask themselves.

Mr. H. SCHOLEY said that they were a society of missionaries. For the past 20 months they had been holding comparatively small meetings, and hardly one of them had not modified his views in connection with the great industrial question. An absolute frankness had prevailed at their meetings, and in consequence they had been able to understand one another's difficulties, and had been able to sweep away a good many misconceptions. The Association started with a gathering of six or eight men, and was gradually extended until it came to the decision that it might be made of advantage to the rest of the industrial world, and now they were seeking to extend it still further. They had done a great deal of good work, and would like to go down to the large centres of industry and organise allied associations. Their work should be of an educational character—education in its widest possible sense was meant, including anything that was embraced in the subject of scientific management. They aimed at a propaganda which would bring before the employer and the workpeople the absolute necessity of composing their differences so that when the proper time came they would be able to present a united front to the great industrial struggle that was going to take place. They wanted an immediate increase in their membership, and were going to invite the co-operation of employers throughout the country, no matter what industry they represented. They would also ask the assistance of the trade unions. The Association should develop by forming branch organisations, which could arrange small meetings of employers' and employed, and they in the central association might give them a great deal of help. Their special speakers could pay special visits to places where help was particularly needed. They must, if possible, get to the individual worker. There were a good many questions that they thought the worker should understand, or he could not appreciate the employers' difficulties. The worker could not be expected to take a proper interest in the great problems of trade and finance unless he was brought in touch with them, though not in detail. Education was needed for the manufacturer also, because he was afraid that many of them were going to give some difficulty, but with a well-informed public opinion and with a number of employers taking a real interest in those things, the ultimate result would be that the difficult employers would take a much wider view of their responsibilities to their people, to their industry, and to the nation at large. As to the lines on which the Association should be run, they were aiming at the small manufacturers. Very large numbers of them would be interested in this scheme. It had been questioned whether the Association was not in danger of overlapping the work of other organisations. They had ascertained what those organisations were doing, and as a result they thought that they were on a special line of their own, though they were working in close harmony with other associations, and at any time that it might be necessary, they would be ready to come together in the common cause.

Sir ALBERT STANLEY said that he had never had any objections to associating with so-called Labour leaders. At the Board of Trade they were prepared to take the responsibility for dealing with the most serious outstanding problem that confronted them—the relation of the employer to the employed. He had had a good deal of experience in America. He was identified with two separate undertakings, one rapidly succeeding the other. Each of those undertakings had in its employ practically 30,000 men. One of the undertakings was really the last word in trade unionism. Every single employe was bound to accept membership of the union. The other undertaking was entirely free from that sort of influence; so far as he knew not a single man identified with it had any connection with any trade union movement. He found that in the trade union undertaking provision was made whereby any grievance could be brought forward and carried right to the very top for the purpose of adjustment. It frequently came to his notice, as manager of that undertaking, that grievances on the part of the men had a real genuine foundation. It frequently came to his notice that some unofficial was not justified by the facts in some action he had taken. As a result of the method which existed many grievances were remedied. No such machinery, at least no adequate and satisfactory machinery existed in connection with the other undertaking. If there was any grievance it lay smoldering beneath the surface and had no opportunity for adjustment. The result convinced him that whether it was done by established trade unions or by securing the co-operation of the man's selected leaders whatever the system might be it was absolutely essential for the successful conduct of a business in which a large number of men were employed that there should be set up machinery which would secure to the men an opportunity for bringing their grievances forward and securing them against punishment on the part of the officials. Undoubtedly, in this

country to-day there was a great deal of dissatisfaction, and a growing dissatisfaction among the working people. They had to face that and recognise it, and it was the duty of every man who employed labour, everyone connected with the Government, and every trade union leader, to recognise it, to face it honestly, and to take the right steps for bringing about an immediate improvement. The lesson that he learnt in America was a lesson which could be adopted here to-day. Taking it on the whole, he could not help feeling that the working men of this country had not been sufficiently educated, and had not a sufficient knowledge of the problems that confronted the business interests of this country. He felt that somehow, whether it was done through their accredited leaders, or however it might be done, they had to find a way whereby those great problems, which were going to be infinitely more serious when the war was ended, could be brought home to the working people so that they might have a better understanding of them, and so that their decisions on them might be based on an intelligent knowledge of what needed to be done. Thereby they would have the opportunity, the privilege, the right of associating with the employers so that whatever might be their action, it would be based on facts, and not on mere gossip, or, as sometimes was the case, on an unfortunate expression in the daily Press. The chairman had paid proper tribute to the success which had crowned the efforts of the men who, in times past, by hard work and diligent effort, had established business undertakings in this country. What they had to consider now was whether they could travel on that same road and continue to apply those same methods in the future. If they investigated the progress which had been made by Germany during the last 15 or 20 years, and if they compared the value of her export trade, and saw the curve of her alarming growth and expansion, they would observe how close that line came to the value of the exports of this country in 1914. When they saw that, he could not help but think that they would then give careful investigation into the methods which brought that country so alarmingly close to us. The chairman had suggested that the ideal to aspire to was that our exports should show an enormous expansion, and our imports a corresponding diminution. During the seven months that he had held Cabinet office there had been times when he had felt that if he could be relieved of some of the burdens of that office he would be quite content, but if he could be assured that by holding on he would be helping to bring about the accomplishment of that particular object, then he would be very happy indeed to be President of the Board of Trade. He was satisfied that in this country we had the ability and the resources that were necessary, and he knew, too, that every one of our Overseas Dominions and all our possessions were most anxious to co-operate with us in solidifying this great Empire and in making it one unit with one common aim and aspiration—the creation of the greatest trading and industrial Empire the world had ever seen. But unless they found some solution to that problem, some way whereby the employé would be more contented, and have a better recognition of the great issues that confronted them, he could not see any hope of that ambition being fulfilled. He felt that if the employers of this country would only recognise the altered circumstances, realise that the conditions had changed, that we were living in an entirely new world, and that the working man was going to demand more and more his share of the comforts of life, then he believed that that would at least go a long way toward solving that terrific problem. Sir Albert referred to the necessity of co-operation of the employés, without which there was no possible chance of a permanent success.

(To be concluded.)

LEGAL.

W. SANDORIDES, LTD., v. FRANCO-BRITISH ELECTRICAL CO., LTD.

IN the King's Bench Division, on July 19th, Mr. Justice Ridley heard an action in which plaintiffs sued defendants for rent in respect of an electric sign at 7, Oxford Street.

MR. J. G. PEARCE, for the plaintiffs, said the claim was for four quarterly payments, from August, 1915, to May, 1916, due to the plaintiffs from the defendants under an agreement by which the plaintiffs granted to the defendants a licence to place an illuminated sign over a part of 7, Oxford Street, W., for a period of five years from August, 1914, and for which the defendants agreed to pay £120 a year in quarterly instalments. The sign which was placed there on the execution of this agreement, and which was there still, was an advertisement of Pears' soap. It was a very striking feature as one came along Oxford Street or down Tottenham Court Road. The defence set up was that under the Defence of the Realm Act there were certain regulations regarding the lighting of the London streets, and restrictions were imposed by which the defendants were no longer able to carry out their agreement. Apparently, said counsel, this meant that the contract was dissolved. But the answer to this was obvious. The sign was a sign by day as well as by night. By day it was visible from 300 yards; it was there still. The only effect the working of the Defence of the Realm Act could have would be to make the sign of less value—certainly not of no value. There was nothing

in the Defence of the Realm Act to prevent the sign being illuminated during certain hours even now, and a great many signs were at the present time being illuminated up to nine o'clock.

MR. DUGGON POLLOCK, for the defendants, argued that if the sign was not lighted, it was of no use to his clients. If his Lordship held that the sign still had a day value, then the defendants had a totally different thing to that for which they contracted.

HIS LORDSHIP said the plaintiffs were entitled to succeed in this case. The defendants might think they had a hard case, but there was a certain amount of hardship either way. In this case it did not appear to him that this was a contract which was rendered impossible. Mr. Pollock had argued that the contract was only for an illuminated sign, but it seemed to him (his Lordship) certain that the sign was being used in the day time. He was not inclined to accept the position of the defendants, who took the electrical view, that it was impossible to do without electricity. The restrictions on the electric lighting of the London streets had been lightened, and the defendants still had the advantage of the illuminations during certain hours, and in the future there might be still further facilities.

HIS LORDSHIP entered judgment for plaintiffs for £120 and costs, and on the application of Mr. Pollock granted a stay of execution pending a possible appeal, the money to be paid into Court within 14 days, and costs to be taxed and paid to plaintiffs.

E.S. CO., LTD., v. TREDEGARS, LTD.

IN the King's Bench Division, on July 18th, Mr. Justice Ridley had before him the action E.S. Co., Ltd., proprietors of Electrical Supplies Co. v. Tredegars, Ltd.

The plaintiffs claimed the sum of £263, the price of goods sold and delivered, and defendants admitted that they were indebted to the plaintiffs for that sum, but counterclaimed for £193, goods supplied to plaintiffs, and paid the balance into Court.

MR. A. H. RICHARDSON, for the plaintiffs; MR. C. H. SMITH, for defendants.

MR. SMITH, opening the case on the counterclaim, said the action was originally brought by the Electrical Supplies Co. for £263 for goods supplied. The defendants, who also dealt in electrical goods, claimed that they had a set-off against the amount claimed for £193, goods supplied to plaintiffs, and the defence to the counterclaim was that, although the plaintiffs actually ordered these goods, it was on the condition that they were to be equal to sample and subject to the approval of a customer. The plaintiffs said the goods were not according to sample, and, therefore, there was no contract.

The plaintiffs, said Counsel, approached the defendants with regard to the purchase of electrical switches, and defendants said they had 45 gross of Japanese switches, of which they would supply 30 gross at 10s. 9d. per dozen. Mr. Summer, their manager, said he would like a sample, and then he would let them know, definitely whether he would take the 30 gross. The next day he sent for the sample, and the defendants eventually sold the plaintiffs the switches as Japanese switches. What had evidently happened, suggested Counsel, was that the plaintiffs had a contract to sell to Edison & Swan some English switches, and that they were trying to pass off on them Japanese switches. Edison and Swan refused to accept them, and then the plaintiffs tried to repudiate the contract.

After hearing evidence,

HIS LORDSHIP, giving judgment, said he was of opinion that the contract was provisional, and subject to an order from Messrs. Edison & Swan, who, when the goods arrived, refused to accept them, as they did not comply with their order, because their order was for English, and not Japanese, switches. He had come to the conclusion that there was a conditional term upon which these goods were ordered. The plaintiffs succeeded on the claim, and the defendants failed in their counterclaim, and there would be judgment for plaintiffs for the amount paid into Court, and for £193, the balance, together with costs on the claim and counterclaim.

C. J. FERGUSON & SONS v. C. ISLER & CO., LTD.

IN the King's Bench Division on July 19th, before Mr. Justice Atkin, an action was heard in which plaintiffs, electricians, of Chiswell Street, E.C., sued C. Isler & Co., Ltd., Artesian Works, Bear Lane, Southwark, in respect of the alleged detention by the defendants of a 50-H.P. motor and starter, which, it was said, was hired to them for a definite period of one week for work in connection with the Hackney Borough Council electrical supply service. The plaintiffs said they let the defendants have the hire of the motor under an agreement of April, 1915, together with apparatus for electrical wiring, and they also did the work of wiring cables suitable to enable the motor to do the work that was required. They claimed damages because, as they said, the defendants had wrongfully detained the plant, and in consequence they (plaintiffs) had had a claim against them by the firm of A. Bridgman & Co., Ltd., of City Road, from whom they had hired in order to re-hire to the defendants. The defendants denied that there was an agreement to hire for the exact period alleged, and they denied liability for more than had been paid into Court.

In giving judgment after hearing the evidence, MR. JUSTICE ATKIN said he was of opinion that it was agreed that the period of the hire should be one week. It appeared that another starter had to be provided, and when the motor began to work it was found that the results were not as speedy as anticipated. The motor was kept for several weeks on the work. In the meantime, Messrs. Bridgman were wanting the plant and pressing the plaintiffs for

its return. The defendants wrote to say that they were ready to pay an additional hire figure, and they had had to keep the motor longer than was thought through difficulties that were not anticipated. He (the Judge) was satisfied that the period of hire agreed on was one week on the terms of £25, £20 for the fixing, and £5 for the hiring. The defendants kept the machine for some weeks, and then took up the position that the motor was hired without any stipulations whatever. He thought the plaintiffs did agree to the defendants retaining the motor for a certain period, but they gave notice of the termination, and henceforward there was wrongful detention by the defendants, and a violation of the plaintiffs' rights. He thought the defendants must have known that the consequence of their detaining the motor was that Messrs. Bridgman would take steps against the plaintiffs; and, in fact, Messrs. Bridgman did claim special damages against the plaintiffs because of the detention of the machine. The defendants did not release the motor until it was convenient for them to do so. He thought the plaintiffs were entitled to judgment on the claim for a total of £71 10s.; and he gave them judgment for this sum, and costs, including certain costs incurred in connection with the action against the plaintiffs by Messrs. Bridgman.

GAS LIGHT AND COKE CO. v. HACKNEY BOROUGH COUNCIL.

IN the Chancery Division, last week, Mr. Justice Astbury began the hearing of an action by the Attorney-General at the relation of the Gas Light and Coke Co. against the Mayor and Corporation of Hackney, which involved a complaint by the plaintiff company that the defendants were making differential charges in their supply of electricity, in breach of sections of the Electric Lighting Act, and plaintiffs asked for a declaration to that effect and an injunction.

Mr. Russell, K.C., Mr. Colefax, K.C., and Mr. Percy Wheeler appeared for the plaintiffs; and Mr. A. J. Walter, K.C., and Mr. Spence for the defendants.

MR. RUSSELL said the plaintiffs supplied gas for lighting and power and other purposes within a certain area, and the Borough Council of Hackney supplied electrical energy for lighting and power within a certain area which was within the plaintiffs' district, and they did that under the provisions of the Hackney Electric Lighting Order of 1893, the principal Act being the Electric Lighting Act of 1882, Sections 19 and 20 of which plaintiffs said were being violated. These set forth that where a supply of electricity was provided in any part of an area for private purposes, except in so far as otherwise provided by licence or special Act authorising such supply, every company or person within that part of the area should, on application, be entitled to a supply on the same terms on which any other company or person in such part of the area was entitled under similar circumstances to a corresponding supply; and the undertakers should not, in making any agreement for the supply of electricity, show any undue preference to any local authority, company, or person, but might make such charges not exceeding the limits of the price imposed by the licence or special Act. The matter in respect of which the plaintiffs were suing was the scale of prices published by the defendants in July, 1914. The scale was for lighting, alternative I, for any quantity of electrical energy used each quarter, not exceeding the equivalent of one hour's supply per day, at the maximum demand, 6d. per unit; for any further quantity of electrical energy in each quarter, 1d. per unit; alternative II was a flat rate. For power (this was what plaintiffs complained of), alternative I, a fixed charge of £1 per quarter per kilowatt of maximum power demanded, and a charge for electrical energy used of ½d. per unit. Consumers paying under this scale are allowed to use 20 per cent. of the energy consumed for lighting. The effect of that, said counsel, was that consumers of energy for power were supplied with energy for light at a lower rate than the persons who were consumers of light only. Counsel argued that a light consumer was entitled to be supplied with his light on the same terms as another person, and to give favourable terms to a power consumer in respect of his lighting was to induce him to become a customer.

SIR JOHN SNELL, Vice-President of the Institution of Electrical Engineers, then gave evidence, and said he had investigated the question whether or not the defendants had been supplying electricity at a profit or loss, having regard to the charges that were made, and he had come to the conclusion that a profit was made on lighting but a loss on the supply of power.

In cross-examination, MR. WALTER asked Sir John whether he was aware that this year, with 1 million units less for lighting and 6 millions more for power, Hackney had wiped out a loss, and carried forward £6,000 for the relief of rates.

SIR JOHN said he did not know that, as he had not had access to the accounts for this year.

MR. WALTER: And the whole net increase to consumers is not 15 per cent.

WITNESS: You have done very well.

MR. WALTER said the cost of material, including coal, had much increased, and the witness agreed. Sir John also agreed that, as a class, the power consumer had a better load factor than the light consumer, and the former class had also a better diversity factor.

Then there is a further factor that, as a rule, the power user, as a class, uses more electricity than the light consumer as a class. As a rule.

All these factors, of course, are circumstances which are taken into consideration in fixing the price. Certainly; that is why you charge twice as much for lighting as for power.

In so far as the power user has 20 per cent. of light, his load

factor is slightly worsened by that percentage?—If he has power alone it is worsened.

SIR JOHN was then cross-examined on the 1914 accounts of the Borough Council with reference to their electrical undertaking, these being the accounts which were placed before him for the purpose of investigation.

On Thursday, last week, MR. A. J. WALTER, K.C. (with him Mr. Spence), for the defendants, submitted that the action was entirely misconceived. It was founded on an entire misunderstanding of Sec. 19 of the Electric Lighting Act (the section which with Sec. 20 plaintiffs complained that the defendants had violated), and of the Long Eaton lighting case which, properly understood, was the authority directly in favour of the present defendants. The plaintiffs came to the Court as the champions of light, though their real business was to sell gas.

HIS LORDSHIP pointed out that the point between plaintiffs and defendants was as to the relative profit made by the defendants' undertaking during a particular period as between power and lighting. Sir John Snell thought that the power was being supplied at a loss, or, at all events, at a less advantageous rate than lighting.

MR. WALTER said Mr. Merz, his witness, said the business was paying on the power, and the figures showed that in 1916, when the price of coal was up, the defendants converted a loss of something like £8,000 into a profit of over £6,000, although the lighting load had gone down 1,000,000 units.

MR. CHARLES MERZ, consulting engineer, gave evidence for the defendants. He said the capital cost was a considerable item in all electrical undertakings, and the plant must be sufficient to supply the maximum demand. The regularity of the supply was a most important factor in the cost of production of the supply. As between a lighting load running only two hours a day and what was called the high-load-factor consumer, the difference of cost might be several hundred per cent. in a municipal undertaking. Two hours a day was generally known to cover a very large number of lighting consumers. Power users for the purpose of their own businesses desired to have the highest possible load factor; it affected the wages bill and every other item in connection with factory cost, and the load factor was reflected back to the station. There had been a large number of Power Acts passed by Parliament. The North-East Coast group of power companies turned out about one-fifth of the total electricity of the country. Electrical energy was by the Power Acts allowed to be supplied for power purposes, and it followed that it was also necessary to supply light for all the factory purposes, and to allow 20 per cent. of the supply to be used for lighting purposes. The electrical energy supplied took no notice of whether it was supplied for power or light. The result of that was that in all power businesses a large undertaking must seek more and more to supply the manufacturer or factory user who would insist on being able to take his light or power from one set of wires. With regard to the Hackney Borough Council undertaking, witness said the power business was undoubtedly paying in 1913. The lowest charge was ½d. per unit, and the lowest cost was 348d. The fixed charges amounted to £12,000 per annum, and supposing that power had not been sold, the Corporation would have lost £12,000 right off. He had gone into the question of the actual payments with the view of trying to check the diversity factor. As the power business was the one which had a diversity, that was the one class of business whose combined demand could not be got from the consumer's account, as they did not know the incidence of the lighting demand. The diversity factor of the other business was practically negligible. Losses were higher on the peak, because on a direct-current system there was no loss on low load, though there was an increasing loss on the high load. The system he had adopted of ascertaining the cost was the one usually adopted to get at the rate to be paid by those who took power in the daytime. During the period of non-peak load the losses were less, and it was utterly unfair to charge those losses to the day load. The result of the power business was to put the undertaking in a better position by £12,000 a year.

MR. J. A. JENKINS, accountant of the Borough of Hackney, said the accounts of 1916-17 showed that for lighting 1,825,075 units were sold, and for power and factories 12,465,635, and the amount carried forward was £6,918, without taking into account £14,691 allowance to employees at the war. The net profit was £5,456. That was after meeting every obligation. The capital to date was about half a million. A large sum was paid off capital except in the first two years, and there had been a large contribution to the rates during the period of working the business. A reserve of £21,669 up to March 16th had been created. There was a deficiency only up to 1902. Owing to the large increase in the cost of coal last year, £6,000 had to be debited to reserve.

On Wednesday last MR. JUSTICE ASTBURY delivered judgment, holding that the defendants had not threatened or intended to do anything in breach of the provisions of the Act of 1882. The action therefore failed, and was dismissed with costs. The detailed judgment will appear in our next issue.

ELECTRICITY WORKS FATALEITY: COMPENSATION.

AT Bolton County Court, last week, application was made for the appropriation of a sum of £300 which had been paid into Court in connection with a fatal accident some time ago to George Edward Horler, switchboard attendant at the Bolton Corporation's Electricity Works, Back-o'-th'-Bank. On behalf of the widow, Annie Horler, it was stated that there was an unborn child, and its interests would have to be considered when the money was allocated. His Honour sanctioned the payment of £10 down and £3 a month, and asked that the case should be mentioned again when the child was born.

LEAVING CERTIFICATE GRANTED.

AT the Oldham Munitions Court, last week, an employé of an electricity undertaking asked for a leaving certificate. His wife was in London as a teacher under the London County Council, and he wished to take an appointment there, and so be near her. Each month for the last 11 months he had asked the chief engineer of the works to release him, but each time the request had been refused. It was not a question of money with him, as he would be receiving less in London. A letter from the employers said the applicant was their shift engineer, and he had got married since accepting the appointment with them. The leaving certificate was granted.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

A Revelation Concerning the Ways of Reviewers.

As regards my quotation last week from the remarks of one of your reviewers in the preceding issue, it was clear that about the only defence that could be put forward for those remarks would be that they were made as a joke. In your comments on my letter you make this very excuse for your reviewer; but why not have let him give his own explanation?

Assuming the matter was a joke, may I point out that it was a dangerous sort of joke, being of the type that could be variously described as the boomerang, spring-back, or double-edged. In plain language, your reviewer cited the very procedure which is sometimes adopted by unscrupulous reviewers, and he consequently laid himself under suspicion. A parallel example would be that of a baker who joked about sawdust in flour.

As in the course of the next few months three or four new publications from my pen will be submitted to you, I venture to hope that they will be handed to reviewers who will "get interested" in them.

W. Perren Maycock.

West Norwood, London, S.E. 27,
July 21st, 1917.

[Be it understood that we disclaim all responsibility for the joke referred to; it is coeval with the mother-in-law joke, and we should have thought that every writer of books was familiar with it.—EDS. ELEC. REV.]

WAR ITEMS.

German Control of Electricity Consumption.—The Federal Council has authorised the Imperial Chancellor to exercise control over the production, transmission, and consumption of electricity and gas, as well as of steam, compressed air, and hot and potable water. A department has already been created to carry out the order issued to this effect, which aims at the uniform regulation of the agencies in question.

Trading with the Enemy.—The "London Gazette" for July 20th contains further names of persons and bodies in the following countries with whom trading is prohibited:—Argentina, &c.; Brazil; Chile; Netherlands and Netherland East Indies; Norway; Spain, &c.

Recovering the French Collieries.—We read in the *Times* that Mr. Maurice Deacon, M.I.C.E., has accepted the honorary position of technical adviser to the British Government, in association with the French Ministry of Mines, with regard to the recovery of the French collieries which have been destroyed by the Germans in the Lens coalfield.

Thyssen Profits.—A German newspaper states that the Thyssen Factory, at Mülheim, shows a profit of 14 million marks, with a dividend of 10 per cent.—*Times*.

Hull Electricity Employés and Substitution.—At the last meeting of the Hull Electricity Committee, the acting engineer stated that the Military had asked for six more of their men under the substitution scheme. He had pointed out that it was impossible for them to be released, and if they were taken the authorities would have to take the risk of the undertaking. The matter had therefore been deferred for a time.

Exemption Applications.—At Blackpool Tribunal, it was mentioned that in the cases of 14 employés of the electricity and tramways department it had been agreed with the Advisory Committee that 13 should have temporary exemption to the end of December, and leave to appeal be given in the other case in the event of his being called up. Mr. J. W. Mitchell asked if any Corporation officials sat in these cases, and the Assistant Military Representative replied that they would. He added that all the men were in certified occupations, and the department was working at the lowest possible minimum.

At Aldershot, Messrs. T. White & Co., Ltd., appealed for G. S. Velvick (33, B1), who has charge of the firm's electric light branch and supervises all the work. The Military objected, as Velvick has had exemption since June, 1916, but three months were conceded.

At Eastbourne, Mr. Brydges, borough electrical engineer, appealed for 12 employés at the works. The cases had been adjourned to see if the men would be protected by the Government, as they were partly engaged on munition work. Mr. Brydges said that the Government would not protect men where the output was less than two-thirds. He contended that all the men were engaged on work of national importance in supplying light and power, even if they did not do any munition work at all. The appeals were resented for further consideration.

On the appeal of the Aldershot & District Traction Co., three months have been allowed to a fitter and driver, six months to another driver, and in the case of a third driver, he was reserved for substitution.

Pershore Rural Tribunal has granted temporary exemption until September 15th to G. Ballard (32), electrician to Lieut.-Col. H. M. C. Porter, of Birmingham, who is on active service.

Extended exemption until the end of the year has been granted by the Nuneaton Tribunal to P. H. Howe (28), electrical fitter, on the ground that he is doing work of national importance.

Before the Hants Appeal Court, the Military appealed against exemption held by H. W. Keeping (40, B1), electrician, of Shanklin (Isle of Wight). The Military Representative suggested that the business was only a small one, but respondent said that it was established in 1859, and he took it over from his father. He was the only electrician in the town, and did work at the hospitals and nursing homes. The appeal was allowed, the calling-up being fixed for August 7th.

An appeal was made at Peterborough for the retention of T. C. Roskelly (31, Class B1), electrician to Mr. H. Czarnikow, of Stoke Doyle, who has been previously rejected. The appeal was refused.

A Military review was made at Hastings of the case of R. H. Pattenden, electrician, with Messrs. Upfield & Son. It was stated that Pattenden had a number of electric lifts to look after, and it was suggested by the Military Representative that in war time people might walk upstairs. The Tribunal allowed two months in which to find a substitute.

Bedfordshire Appeals Court has given delay until September 16th to Edward Foster, electric light attendant, appealed for by Captain R. S. Bruce, of The Knolls, Leighton Buzzard.

On the recommendation of the Advisory Committee, Rochdale Tribunal has given exemption until October 31st to R. H. Hogg (37), motorman on the Corporation tramways. The Tribunal has also given exemption until October 15th, on the appeal of the tramway manager, to J. T. Hoyle (34, B1), controller, examiner, and cleaner, and J. E. Kershaw (36, B1), traffic clerk and week-end inspector.

Chatham Tribunal has confirmed a previous decision giving conditional exemption whilst holding Ministry of Munition certificates, to five motormen with the Chatham & District Light Railways Co.

At Douglas (Isle of Man), the Military appealed against conditional exemption granted to L. Dyer (27, C2), electrician engaged at the Manx Brush Factory and elsewhere. The appeal was disallowed, and the exemption confirmed.

The Whitechurch and Pangbourne Electric Supply Co. appealed for further exemption for J. L. Rushby (18), electrical engineer, passed in Class C3. It was stated that he assisted with the engine switchboard, and often ran the water power alone in the absence of the engineer. There were only two employés left out of five. Six months' conditional exemption was granted.

The cases of three car drivers with the Electric Tramways, Ltd., were considered by the Bath Tribunal. W. Swift (24, C3) and F. G. Atwick (36, C2), were given conditional exemption; and exemption was refused in the case of G. O. Snell (25, C2), whose retention was not pressed for by the engineer and manager.

At Oxford, the Military had a review of conditional exemption granted on June 15th to F. M. Stedworthy (38, general service), electrician and fitter with Mr. A. H. Pearson. The latter said that Stedworthy was his last man. Two months were granted.

At Rugby, Mr. W. H. Linnell appealed for H. W. Gilbert (24, Class C2), the only electrician left on his staff. Captain Wratislaw expressed the opinion that there were sufficient electricians in the town to do the private work. The Chairman said that as the man was a skilled craftsman he would have a code number, and under the circumstances they would dismiss the appeal, and throw the man on the mercy, tender or otherwise, of the Complaints Section of the Munitions Committee.

At Farsley, near Leeds, the Morley Electrical Co., Ltd., appealed for their secretary, Mr. N. Hill, single, aged 29, and classified C3, and for a foreman winder, H. Moore, aged 26, married. Mr. Hill was stated by Mr. Sumnerscales, the manager of the company, to be the only man left in the office, and the commercial side of the business was complicated, and it would take a long time to train a new man to the work. He had not been medically examined since being originally passed, but Mr. Sumnerscales thought he would certainly be in Class A. These two men ran the shop, and

if they were taken it would mean shutting down. The last time Moore was appealed for it was agreed that he was in a certified occupation. The Military Representative said that Moore was not certified on the new list, as armature winding had been removed. In answer to Mr. Summerscales's statement that the firm were on munition work, Mr. Sugden said if they could show they were on munition work they could retain Moore by putting him in a protected trade. Mr. Hull was given to September 30th, and Moore to July 31st.

BUSINESS NOTES.

The South African Electrical Market.—The ordinary household metal filament lamps are scarce, and the price has advanced smartly in consequence. The prospects of getting adequate supplies are anything but bright, as very little electrical goods came out by the last mails. Business is quiet through the shortage of stocks, which requires qualifying. It appears there are plenty of some kinds, but many of the etceteras are lacking, therefore jobs cannot be completed, and another reason is that the Johannesburg municipality is not giving any new (as distinct from old premises) electric light connections. The mines have practically cleared the merchants' stores of electric motors and power plant, as well as cables.—*S.A. Mining Journal*.

Time Checking.—The war has brought many radical changes into the large industrial works of the United Kingdom, and not the least amongst these is the accurate checking of employees' time, the exact regulation of meal intervals, also starting and stopping of work. MESSRS. GENT & CO., LTD., have orders in hand for many munition factories and Government-controlled works for "instituting time circuits" for controlling existing spring-driven workmen's check clocks and other clocks in buildings. By a simple and efficient means, all workmen's check clocks are controlled by their Pulsynetic electric transmitter, thus ensuring correct and uniform time throughout the establishment. The system is so elastic that any number of check clocks or time dials may be added to the circuit as occasion demands, and alarm bells or sirens can be operated automatically to any given programme or programmes. In many instances these programmes vary with the day of the week, and also with the department. All such variations can be dealt with effectively.

Catalogues and Lists.—MESSRS. FERRANTI, LTD., Central House, Kingsway, London, W.C.—Pamphlet TA 174 (10 pages), giving detailed and illustrated instructions for the installation and maintenance of oil-immersed static transformers. "Z" ELECTRIC LAMP MANUFACTURING CO., LTD., Southfields, London, S.W.—Specimens of postcards and billheads that have been designed for the use of the trade, and will be supplied over-printed with customers' names and addresses. The billheads are in pads of 100.

WESTINGHOUSE COOPER HEWITT CO., LTD., 80, York Road, King's Cross, N.1.—List No. 75A (8 pages), dealing with the mercury vapour converter for transforming A.C. General information, tabulated data and prices, and dimensioned diagrams, are given. A special series of rectifiers is now being manufactured for the charging of telephone batteries.

MESSRS. J. B. SAUNDERS & CO., LTD., 91, York Street, Westminster, London, S.W.—Interesting pamphlet on the advantages of overhead mains for the electric lighting of small towns. Only the first few pages contain letterpress, the whole of the remainder giving excellent half-tone photographic views showing overhead electrical distribution work in Carmarthen, Maesteg, Sirhowy Valley, Faringdon, Woodbridge, Whitstable, Braintree, and at a number of military camps.

Trade Announcements.—MR. F. H. MORLEY, of Star Buildings, Northumberland Street, Newcastle-on-Tyne, has been appointed representative for the Newcastle district by the New Switchgear Construction Co., Ltd., for the sale of their switchgear and apparatus.

MR. FRANK FILLINGHAM, late of Messrs. Wright & Fillingham, electricians, of 215, Beverley Road, Hull, has commenced business on his own account at 121, Beverley Road.

Book Notices.—"Memoirs of the College of Science of Kyoto Imperial University, Japan." Vol. II, Nos. 1 and 2, have come to hand. The second number contains particulars of a research by Mr. Usaburo Yoshida on the figures produced on photographic plates by electric discharges; an explanation of the mode of formation of the figures is put forward, and a series of beautifully executed reproductions of spark figures is given. The spectra of metals in the extreme ultra-violet are the subject of a research by Messrs. Toshio Takamine and Shigeharu Nitta, and the former, with Mr. Yoshida, also studied the effect of an electric field on the spectrum lines of hydrogen.

"Logarithms for Beginners." By C. N. Pickworth. Manchester: Emmott & Co. Price 1s. This work is now in its sixth edition. The principal alteration is the addition of a table of logarithmic trigonometrical functions to the collection of tables previously included.

"Indicator Handbook. Part II." By C. N. Pickworth. Manchester: Emmott & Co. Price 3s. net. This, the sixth edition, contains a new table of mean-pressure factors for different conditions of expansion, and has been revised in other respects.

"Post Office Electrical Engineers' Journal." Vol. X, Part 2, July, 1917. London: H. Alabaster, Gatehouse & Kempe. Price 1s. net.

For Sale.—The Central Electric Supply Co., Ltd., has for disposal one triple-expansion 2,200-I.H.P. non-condensing marine type standard Belliss engine, complete, direct coupled to one 1,400-KW., three-phase alternator, &c. Full particulars are given in our advertisement pages to-day.

Fires.—A fire (damage £500) occurred last week in the electric generating station of MESSRS. SAMUEL HEAP & SON, LTD., Spotland Bridge Mill, Rochdale. The cause was the tipping of hot blue dirt against the door of the building.

A fire occurred last week at the premises of MESSRS. GILLETT, electrical engineers, Great Market, Newcastle.

The fire which occurred at the works of MESSRS. D. H. BONNELLA AND SON, LTD., Mortimer Street, W., last Friday, was confined to a portion of one floor. The general operations of the factory are not in any way interfered with.

Holidays.—The works of the TYLER APPARATUS CO., LTD., Banister Road, North Kensington, W. 10, will be closed for the holidays from August 3rd to 13th.

The works and offices of the GENERAL ELECTRIC CO., LTD., Witton, will be closed from the evening of Friday, August 3rd, until the morning of Monday, August 13th.

THE BRITISH WESTINGHOUSE CO. announce that, though their works at Trafford Park will be closed from to-day until August 7th for overhauling and repairing the plant, special arrangements have been made in the Receiving-Department to accept materials, and also for the despatch of completed apparatus, during that period.

Dissolutions and Liquidations.—KORTING BROS., LTD.—Meeting of creditors August 7th, at 2, Coleman Street, E.C. Liquidator, Mr. A. G. Parker. Cheques for the full amount due to all creditors will be dispatched prior to the meeting date.

PLUTTE, SCHEELE & CO., LTD.—The Controller, Mr. G. W. Roberts, 133, Wool Exchange, E.C., has applied for his release.

STEEL'S ELECTRIC AND ENGINEERING CO., LTD., Poplar.—First meeting of creditors and contributories August 2nd, at Carey Street, W.C.

WRIGHT & FILLINGHAM, electricians and plumbers, 215, Beverley Road, Hull.—Messrs. J. Wright & F. Fillingham have dissolved partnership. Messrs. Walker & Colbeck, 9, Parliament Street, Hull, will attend to debts, &c.

LIGHTING AND POWER NOTES.

Ashton-under-Lyne.—The electricity undertaking, which of late years has made substantial contributions to the rates, will require the provision of about £3,500 this year.

Australia.—The Chief Commissioner for Railways has informed the Newcastle (N.S.W.) Municipal Council that he is prepared to supply electricity for power and other purposes. It is stated the arrangement will obviate the necessity for extending the municipal plant.—*Sydney Daily Telegraph*.

Bath.—At the last meeting of the Council the electrical engineer submitted the tenders for an Underfeed stoker to be fitted to a marine boiler, and a transporter for the conveyance of coal to the stoker. He estimated that £1,000 per annum would be saved by this installation, and the Council decided to expend up to £1,200 on the plant.

Brighton.—PRICE REVISION.—The Electricity Committee has decided that the charge for electricity supplied to all classes of consumers other than power-users within the borough be increased by 10 per cent.; that the flat rate of 6½d. per unit for electricity supplied outside the borough be increased by 10 per cent.; that a meter charge of 2s. 6d. per quarter, payable in advance, be made for each prepayment meter installed; that the charge for electricity supplied to the Corporation tramways be increased from 1½d. to 1½d. per unit; that, except in the case of special contracts, the power rates be increased by 10 per cent.—the increased charges to take effect at the expiration of the current quarter. No alteration is to be made in the charge for bulk supply to the parish of Aldington, and the charge for street lighting is to remain as at present.

China.—A large cotton spinning mill is now in course of erection at Wuchang for a Chinese syndicate. The machinery for the spinning mill, which will be equipped with 40,000 spindles, is to be of the latest pattern, and is to be electrically driven, power being obtained from the Wuchang Electric Light Co. It was found to be impossible, under present circumstances, to obtain the motors from England, and the order has accordingly been placed with the Westinghouse Co., of America. In addition to the spinning mill, it is also proposed to install later a weaving shed with 500 looms.—*Indian Textile Journal*.

The Foochow Electric Light Co. has increased the capacity of its plant from 500 to 1,500 KW., in order to meet increasing demands. The necessary machinery has been purchased from the United States, delivery from England being impossible. This year the company earned 10 per cent. on its capital, and paid a dividend of 13½ per cent. Other small electric light companies are being formed with light Japanese plant at Chuanchou and Sien-yu.

Electric lighting has recently been adopted in the town of Mengtze, Southern China.

Continental.—SPAIN.—A concession has recently been granted for the establishment of a plant to utilise the water power of the River Segura, near Ulco (Province of Murcia), in the generation of electrical energy for industrial purposes.

Darwen.—For the year ended March 31st last, there was an adverse balance against the electricity department of £2,631.

Farnham.—The B. of T. has extended the Farnham Electric Lighting (Extension) Order, 1914, by 12 months.

Great Harwood.—PROVISIONAL ORDER.—The U.D.C. has decided to make application to the B. of T. for a renewal of the Electric Lighting Order.

Halifax.—NEW PLANT.—A 6,000-KW. turbine set, costing some £26,000, was officially started last week by Lady Rhondda. Subsequently the guests were entertained at Bankfield, where Mr. James Parker, M.P., congratulated the Electricity Committee on its work, and Mr. Clem. Edwards, M.P., referred to the great industrial developments of the future, which would necessitate the extended supply of electricity.

At a special meeting of the T.C. on Tuesday, last week, it was decided to secure 21½ acres of land at Copley, as a possible site for a new station, at £3,600, and that expert advice should be obtained on the question of building the station there. Ald. Spencer (a member of the B. of T. Committee on Electricity Supply) pointed out the impossibility of extending on the present site, and stated that the new station would not be built in any case until the proposals of the Government Committee were made known.

The Corporation has appointed Sir John Snell to advise as to the most suitable site for electricity works.

Huddersfield.—PROVISIONAL ORDERS.—The Corporation has notified the Kirkheaton, Marsden, Meltham, Kirkburton, and Lepton U.D.C.'s of the intention of the Corporation to apply, in December next, for Provisional Orders authorising the supply of electricity in those districts.

India.—CAUVERY POWER SCHEME.—The fifth installation of 4,000 H.P. of the Cauvery power scheme at Sivasamudrum Falls, will be completed in September next. It will be by far the biggest unit hitherto provided in Mysore. Only a portion of a generator, quite the last piece of machinery received in these days of restricted freightage, says *Indian Engineering*, has just been delivered at the works. It weighs 13½ tons, and was taken along from the railhead at Maddur station, inch by inch, on a 12-ton lorry drawn by 22 pairs of bullocks. The turbine is the biggest ever shipped East.

Kirkcaldy.—YEAR'S WORKING.—The report of the working of the Corporation electricity undertaking for the year ended May 15th, 1917, shows a total income of £15,321, working expenses, amounting to £10,609, and the gross profit, plus £57 income-tax retained, amounted to £4,768. After deducting interest on capital, £2,557, sinking fund, £2,339, and other charges, £55, totalling £4,951, there is a debit balance of £183. The total number of units sold was 2,314,591; 675,179 units were supplied to the tramways, 230,513 units for lighting, and 1,408,899 for power. The total works cost per unit sold was 1'096d., and the average price obtained per unit sold 1'586d.; the quantity of coal consumed per unit sold was 9'42 lb., against 10'13 lb., the cost being 5'65d., against 6'28 in 1916. The maximum load recorded was 1,034 KW., as against 950 KW. in the previous year; the load factor was 25½ per cent., as against 23½ per cent. The total capital expenditure was £81,316, and sinking fund repayments, £24,426.

Liverpool.—WAGES.—The City Council has formulated a new war bonus scale for its employes, ranging from 3s. a week to 12s. for men and 7s. 6d. for women, and including all wages up to £4 a week. Over £4 and up to £400 a year the scale is 15 per cent.

London.—POPULAR.—The Electricity Committee recommends that the charges for electricity for lighting be increased by 10 per cent, as from October 1st next. The Committee reports that the net profits of the electricity undertaking for the year ended March 31st last were £12,011, of which £7,702 was available for distribution, £3,059 was recommended for the relief of rates, £1,418 for bonus to staff, and £3,224 for reduction of assets.

The City Corporation proposes to agree to the City of London Electric Light Co. increasing its rates for public lighting by 15 per cent. until a year after the war.

Londonderry.—Mr. J. Christie, engineer and manager of the Brighton Corporation electricity undertaking, has been invited by the authorities to collaborate with the resident city engineer in carrying out the extension of the electricity installation in the shipyard.—*Daily Telegraph*.

Mansfield.—YEAR'S WORKING.—The annual report of the Electricity Committee for the year ended March 31st shows a gross profit of £7,121, as compared with £7,934 in 1916, and, after payment of interest on loans (£3,133), contributions to sinking fund (£2,366), a net profit remains of £1,664, as against £2,718. Coal has cost about £1,140 more and taxes £200 more than in the previous year, but the expenditure on mains and services has been £2,160 less. An item of £489, balance of income-tax, stands over, there being a question as to liability of payment. The Committee has decided to pay over the sum of £500 to the general district rate, and to appropriate the balance of £1,087 to the reserve fund.

Mytholmroyd.—E.L. PROPOSALS.—Having been informed by the Electrical Distribution of Yorkshire, Ltd., that it is about

to make application for lighting powers within the district, the U.D.C. has decided to notify the company that Mytholmroyd does not consent to the proposed prov. order.

Newcastle (Co. Down).—The Urban Council has now accepted the tender of the Irish Towns Lighting Co., Belfast, for the lighting of the town by electricity for the ensuing three years, at £230 per annum.

Norwich.—YEAR'S WORKING.—The report of the Electricity Committee for the year ended March 31st last, shows gross receipts amounting to £57,187, working expenses amounting to £39,293, and after meeting financial charges, &c., the sum of £17,011 was carried to appropriation, as compared with £14,503 in the previous year. From the appropriation account £271 was paid for sub-station premises, £2,283 carried to depreciation, and the balance carried forward. The output advanced by more than 1½ million units to a total of 9½ million units in the year. It was decided to reduce the charge for public lighting to one-third (a saving of £1,100 per annum), which, with the extra cost of labour, represented the proceeds of the extra 5 per cent. added to current charges. It was also decided to obtain a 3½-ton electric wagon from Messrs. Ransomes, Sims, & Jefferies.

Nuneaton.—The Electricity Committee has considered the question of a site for a new generating station, and has recommended the Council to purchase about 3½ acres adjoining the Corporation pumping station, at a cost of £1,200.

Rotherham.—The Sheffield Corporation has given notice to the R.D.C. of its intention to apply to the B. of T. for an Order for the distribution of electricity within the Council's area.

Rochdale.—NEW PLANT.—The Corporation Electricity Committee recommends the installation of three new mechanical stokers of the Babcock type at the generating station, at a cost of about £6,000. The L.G.B. has approved a loan of over £20,000 for extensions to the buildings and plant, and some of this work is already being carried out.

Sutton (Surrey).—The South Metropolitan Electric Tramways and Lighting Co. has informed consumers that the minimum charge of 13s. 4d. per quarter, hitherto not enforced, has been put into operation.

Tunbridge Wells.—YEAR'S WORKING.—The working of the electricity undertaking for the year ended March, 1917, resulted in a total revenue of £15,205, working costs amounting to £8,547, and a gross profit of £6,659, as against £7,214 for the previous year. Interest and repayment of capital dropped from £6,615 to £6,112, leaving a net surplus of £545 against £598. The output in units sold increased from 1,095,874 to 1,188,478; power and heating accounted for 612,073 units, as against 464,690, and the lighting units were 576,405, as against 631,184. There were 317 KW. connected during the year, bringing the total connections to the mains up to 4,164 KW. Some 238 tons less coal were burnt and 173,464 extra units generated. The coal used per unit generated dropped from 6'1 to 5'1 lb., the coal cost per unit sold was reduced from 9'6d. to 8'9d., and these results were obtained without any increase on the pre-war charges.

West Bromwich.—YEAR'S WORKING.—The annual report of the Corporation's electricity undertaking shows that the receipts were £32,047, compared with £24,173 in the previous year. The expenditure on trading account was £29,458, an increase of £8,403, and the gross profit was £2,589, a decrease of £528. Loan charges amounted to £7,285, and there was a net loss of £4,696. The balance remaining in the reserve fund was £2,162. The scale of charges had been advanced during part of the year, but these, it was stated, had not been sufficient to meet the additional cost of manufacture caused by the constant advance in the price of coal, wages, repairs, and maintenance. The Committee recommended further increases in the price of electricity for lighting and motive power purposes as well.

West Ham.—YEAR'S WORKING.—The total income of the electricity undertaking for the year ended March 31st last was £157,148, as compared with £143,611 in the previous 12 months. The total expenditure on revenue account amounted to £110,037, as against £120,066 in the previous 12 months. Including repayment of loans, contributions to sinking fund, and interest, there was a net deficiency of £35,424. The borough treasurer says it is important to consider whether the revised charges still to be put into operation are adequate to meet the case, especially when it is borne in mind that the major portion of the supply is for power for private trading, and that substantial deficits are being charged against the rates—the deficit for this year alone, after deducting allowances to men on active service (£4,612), representing a rate of about 6d. in the £. The Committee is further reminded that there is no reserve or renewal fund to meet any further demands for replacements of any portion of the assets required before the expiration of the loan periods.

Willesden.—There was a surplus of £1,614 on the net revenue account of the electricity undertaking for the year ended March 31st, 1917. The electrical engineer has been instructed by his Committee to point out to the Government Departments concerned conflicting instructions issued by them. It appears that the Priority Branch of the Ministry of Munitions, on July 5th, 1917, prohibited the installation of any new plant without a permit, whereas a letter from the Coal Controller urged the installation of electric heating and cooking apparatus to effect economy in the consumption of coal.

TRAMWAY and RAILWAY NOTES.

Australia.—The employees of the Western Australian Government Tramways are dissatisfied with the result of the recent arbitration award. The Court gave an increase of wages which they expected to be retrospective to December 19th, 1916. The Railway Commissioners have declined to accept this date, and have applied to the Court for an interpretation of the retrospective clause.—*Sydney Daily Telegraph*.

Bradford.—At a meeting of the Tramways Committee it was reported that all claims arising out of the tramway accident at Wyke, last January, had now been settled, the total cost amounting to £2,377.

Continental.—**RUSSIA.**—It is stated in the *Noroye Fremya* that the Minister of Ways of Communication has instructed the engineer, G. E. Grahptlo, to report on the possibility of introducing electric traction in some sections of the Russian railway system, to take the place of steam. This is no doubt due to the present lack of fuel and the prospective scarcity of it in some parts of Russia, even after the war.

PORTUGAL.—In the course of recent labour troubles at Lisbon, the tramway service has been completely stopped.

Darwen.—There was a deficiency of £2,806 on the tramways undertaking for the year ended March 31st last.

Huddersfield.—The manager having reported on the advisability of doubling the track on the Bradley section, the Tramways Committee has decided that application be made for authority to purchase the necessary materials.

Kirkcaldy.—**YEAR'S WORKING.**—The annual report of the Corporation tramways department for the year ended May 15th, 1917, shows a total income of £18,816, working expenses amounting to £12,707, and a gross profit of £6,109; after deducting interest, sinking fund, and other charges, amounting to £5,690, there remains a credit balance of £418. The passengers carried amounted to 5,272,292, a reduction of 130,916. Ordinary halfpenny fares were abolished in September, 1916, and the traffic receipts have increased by £1,377 over the previous year. The average traffic receipts per car-mile were 10'152d., and operating costs 7'01d. per car-mile.

Leeds.—**WOMEN INSPECTORS.**—The proposed appointment of female tramway inspectors is understood to be not favourably received amongst a large section of the employees, and women conductors are amongst the strongest opponents of the idea. The workers concerned object that these jobs should be given to men with long experience in the service, and to men who have come to the tramway from the Army. The employees have taken the matter to their Union, of which most of the women conductors are now members, and the Union has put its views before the Tramways Committee.

Londonderry.—**PROPOSED ELECTRIC CARS.**—At the meeting of the Corporation, on Monday last, a resolution was passed in favour of obtaining powers to run electric railless trolley vehicles, or, in the alternative, motor-buses or electric cars. The general opinion was that the city should have a more up-to-date means of street locomotion.

Manchester.—**WAGES AWARD.**—The Commissioners of the Committee on Production who inquired into the application of the employees of the Corporation for an increase in the war bonus of 2s. 6d. awarded them on June 11th last, have decided that the workpeople have not made out any case for such advance. The text of the award is as follows:—"The Committee on Production on July 16th heard representatives of the Manchester Corporation and the Manchester Corporation tramway workers, and gave the fullest opportunity to enable the employees to give particulars of any difficulties relating to the advance given under the finding of June 11th, and of any special conditions that may operate in Manchester, and having heard the representatives of the Corporation in reply, the Committee's decision is that the case presented to them differed in no material particular from that put forward for hearing on June 8th, and offered no reason for a departure from the award of June 11th." When the Minister of Labour intervened in the Manchester tramway dispute on July 6th the employees at a mass meeting decided to abide loyally by the decision which would be reached as the result of his intervention.

Salvador.—H.M. Consul reports that a British subject has secured a concession to operate electric street cars, for a term of 75 years, in San Salvador and its suburbs. The track is to be of the groove type, and the length of the proposed lines, which will replace the existing mule tramway lines, will be 18 km. (about 11 miles). The concessionaire has the right to increase the track to 50 km. (about 31 miles) later. The State will subsidise the new lines. *Board of Trade Journal*.

South Africa.—The revenue of the Johannesburg municipal tramways for the year ended March last was £35,000 and the profit £6,351. The average working profit per car-mile was 10'21d., compared with only 7'25d. in the previous year.

Southend-on-Sea.—The Tramways Committee has considered the question of providing and fixing a safety device for arresting the fall of trolley booms which may leave the overhead equipment, and has instructed the electrical engineer to provide his safety device upon each of the cars, at an estimated cost

of £3 10s. each. The electrical engineer is to report as to the practicability of running a service of through cars from Leigh to Southchurch and to the Beach.

Tynemouth.—**PROPOSED TRAMWAY DEVELOPMENT.**—The T.C. is considering a scheme for the development of that portion of the Tynemouth and District Electric Tramway Co.'s undertaking which lies in the borough, and which, in March, 1920, it will have the option of purchasing. The present line runs from the New Quay, North Shields, to the end of the Grand Parade, Tynemouth. A Sub-Committee, specially appointed, considered the matter, and recommended that a scheme be provided for a service to connect the several residential areas with the railway station, the shopping district, public institutions, places of worship and entertainment, works, the ferries, and the coast; to link-up the borough with Newcastle and the interlying districts; and to facilitate the development of unbuilt areas which are not now easy of access. The present narrow-gauge system is condemned as unsatisfactory, and it was held that the gauge should be the same as the Tyneside Co.'s system to facilitate through services. The scheme also outlined five different routes. The subject is at present before the Trade and Commerce Committee.

U.S.A.—A recent issue of the *Railway Gazette*, discussing the operating results of the electrified Elkhorn division of the Norfolk and Western Railroad, says the system is a single-phase 11,000-volt, 25-cycle distribution to the trolley, the locomotives being equipped with phase converters and step-down transformers, which convert the single-phase to three-phase energy for use in induction type motors. Electric operation resulted in increasing the speed from 7 to 14 M.P.H., the traffic being mineral. The loco.-mileage increased from an average of 60 under steam to 100 with electric locomotives, per day; practically, the latter can run 24 hours per day. As a result, the number of locomotives dealt with at Bluefield has been reduced from 17 steam to 5 electric, and banking engines from 7 steam to 2 electric. The number of steam locomotives required to deal with the maximum day's traffic was 43, but the heaviest day with electric working was handled by 9 locomotives. Under electric working an increase of 25 per cent. in loaded cars going east, occurred over steam working in 1914; but a decrease of 48 per cent. in engine-hours occurred, despite this. The electric locomotives have not only increased the capacity of the line by 100 per cent., with a considerable reduction in operating costs, but are likewise paying a return on the net cost of the installation.

West Ham.—**YEAR'S WORKING.**—The income of the tramway undertaking for the year ended March 31st last amounted to £166,142, as against £164,110 in the previous 12 months. The expenditure came to £149,989, as against £124,926 in the 12 months ended March 31st, 1916. Deducting interest, repayments of loans, renewals to permanent way, &c., and £16,670, allowances to men on active service, the deficit for the year was £41,197, as against a deficit last year of £10,462. The borough treasurer, in submitting the above figures, suggests that immediate consideration should be given to the question whether the present basis of charge for traffic revenue is sufficient. He points out that after taking in the deficiency for this year, the total either charged or chargeable to rates amounted to £71,026, in addition to which there was a short payment in respect of rates during the period from the commencement to 1909, when the undertaking was not fully rated.

Wolverhampton.—**WAGES ARBITRATION.**—The award of the Chief Industrial Commissioner, in the differences between the Corporation and its employees on the tramways, is an advance in wages of 5s. per week to workers of the age of 18 and upwards, and 2s. 6d. per week under that age, to take effect as from April 1st. Time and-a-quarter is to be paid to members of the traffic staff in respect of all hours worked on week days in excess of 10, and time and-a-half paid for Sundays in respect of Sunday excursion and other special cars run outside and beyond the ordinary Sunday working hours. The case of cleaners and other night workers is left for the consideration of the Corporation.

TELEGRAPH and TELEPHONE NOTES.

Brave Wireless Operator.—The Rear-Admiral Commanding the British Naval Forces in the Adriatic has forwarded to the Admiralty the wireless telegraph logs of H.M. trawler *Floanda*, as an exhibit for the National War Museum. This log was found in a damaged condition in the wireless operating cabin of H.M. drifter *Floanda* after an attack on the drifter line by three Austrian cruisers in the Adriatic on May 15th last. The wireless operator, Douglas Morris Harris, R.N.V.R., continued to send and receive messages, although the drifter was being riddled by shells, until he was killed by a piece of shrapnel whilst writing in the log. Before joining the Navy, Harris was engaged on the clerical staff of the Wolverhampton Corporation Electricity Department for a period of nearly three years.

Halifax.—At Halifax Juvenile Court, last week, five boys were fined £1 each for throwing stones at telegraph insulators. The Magistrate intimated that future offenders in this way would receive more severe punishment.

Secret Wireless in Norway.—The police have discovered two secret wireless stations in Norway. One was at Hangesund, in a bower in a small forest, and the other on an island at Arendal.—*Daily Telegraph*.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—**SYDNEY.**—August 22nd. N.S.W. Government Railways and Tramways. Thirty-six induction motors (Specification No. 488). September 19th.—One 225-H.P. synchronous motor (Specification No. 489). Particulars from Electrical Engineer's Office, 61, Hunter Street, Sydney.

MELBOURNE.—October 10th. Department of the Navy. Pumping plant and equipment for the Commonwealth Naval Dockyard, Cockatoo Island, Sydney. Specifications from the Director of Navy Contracts, Melbourne.

Blackburn.—August 4th. Steam coal for 12 months for the Electricity Department. Mr. P. P. Wheelwright, Engineer and Manager.

Ilford.—July 31st. Electricity Department. Two rotary or motor converters, 4,400 yards E.H.T. cable, 3,600 yards stoneware conduit. See "Official Notices" July 20th.

Keighley.—August 3rd. 12,000 tons best slack and small slack coal for Electricity Department. Six-monthly and twelve-monthly period. Mr. H. Webber, Boro' Electrical Engineer.

Warrington.—August 14th. 7,500 tons of slack coal for the Electricity and Tramways Committee during six months from September 10th, 1917, and alternatively for part or whole of 15,000 tons of slack during 12 months. Mr. F. V. L. Mathias, Borough Electrical and Tramways Engineer, Howley, Warrington

CLOSED.

Australia.—**MELBOURNE.**—Electricity Supply Committee. Accepted tenders:—

699,000 carbons, £2,629.—Beacon Carbons, Ltd.
260 cast-iron boxes, £508.—Cleveland Engineering Co.
150 contact suspension gears, £337.—Lawrence & Hanson Elect. Co., Ltd.
10,000 metal-filament lamps, £667.—Aust. General Electric Co.
1,700 gas-fitted metal-filament lamps, £1,206.—Aust. General Electric Co.
Meters.—Group A, £500, ditto B, £467, ditto D, £490: British Westinghouse Manufacturing Co. Group C, £1,228: Reason Manufacturing Co.

—Tenders.

Government Contracts.—List of new contracts placed during June, 1917:—

WAR OFFICE.

X-ray apparatus and accessories.—F. R. Butt & Co., Ltd.; Cavendish Electrical Co., Ltd.; H. W. Cox & Co., Ltd.; A. E. Dean; Edison Swan Electric Co., Ltd.; Everett, Edgumbe & Co., Ltd.; Medical Supply Association; Watson & Sons (Electro-Medical), Ltd.; White Electrical Instrument Co.

Electric bells.—Cox-Walkers, Ltd.; Peel-Conner Telephone Works, Ltd.
Bridge meggers.—Evershed & Vignoles, Ltd.
Cells (electric).—Siemens Bros. & Co., Ltd.
Insulator cups.—T. De la Rue & Co., Ltd.; Litholite, Ltd.
Electric light fittings and accessories.—Edison Swan Electric Co., Ltd.; General Accessories Co., Ltd.; General Electric Co., Ltd.; J. Sax and Co., Ltd.

Galvanometers.—R. W. Paul.
Copper wire.—Callender's Cable & Construction Co., Ltd.
Electric wire.—British Insulated & Helsby Cables, Ltd.; Callender's Cable and Construction Co., Ltd.; Connolly Bros., Ltd.; W. T. Glover and Co., Ltd.; Liverpool Electric Cable Co., Ltd.; London Electric Wire Co. & Smiths, Ltd.; Midland Electric Wire Co., Ltd.; St. Helens Cable and Rubber Co.; Ward & Goldstone.

Works services.—Installation of electric light: Ellis & Ward, Ltd.

POST OFFICE.

Telegraph apparatus.—Automatic Telephone Mfg. Co., Ltd.; I.R., G.P. and Telegraph Works Co., Ltd.; W. G. Pye & Co.; R. Stafford, Tyler and Co., Ltd.

Telephone apparatus.—British L. M. Ericsson Mfg. Co., Ltd.; General Electric Co., Ltd.; Peel-Conner Telephone Works, Ltd.; Western Electric Co., Ltd.

Telegraph cable.—General Electric Co., Ltd.; Henley's Telegraph Works Co., Ltd.; Siemens Bros. & Co., Ltd.; Telegraph Construction and Maintenance Co., Ltd.; Western Electric Co., Ltd.

Cells.—Siemens Bros. & Co., Ltd.
Arm grips.—Bayliss, Jones & Bayliss, Ltd.
Terminal irons.—Walls, Ltd.

Glow lamps.—British Thomson-Houston Co., Ltd.; Edison Swan Electric Co., Ltd.; General Electric Co., Ltd.

Distribution cable plugs.—B.J. & Helsby Cables, Ltd.

Stay rod.—Bayliss, Jones & Bayliss, Ltd.

Insulator spindles.—Bullers, Ltd.

Cable suspenders.—E. & J. Richardson.

Bronze wire.—T. Bolton & Sons, Ltd.; B.J. & Helsby Cables, Ltd.; Shropshire Iron Co., Ltd.; F. Smith & Co. (incorporated in the London Electric Wire Co. & Smiths, Ltd.).

Copper wire.—T. Bolton & Sons, Ltd.; B.J. & Helsby Cables, Ltd.; Elliott's Metal Co., Ltd.; R. Johnson & Nephew, Ltd.; F. Smith and Co. (incorporated in the London Electric Wire Co. & Smiths, Ltd.); Shropshire Iron Co., Ltd.; J. Wilkes, Son & Mapplebeck, Ltd.

Galvanised-iron wire.—Dorman, Long & Co., Ltd.; Rylands Bros., Ltd.; Shropshire Iron Co., Ltd.

V.I.R. wire.—Union Cable Co., Ltd.

Laying pipes and ducts, Whitehall, S.W.—J. Mowlem & Co., Ltd.

Two electrically-driven fans at Great George Street, S.W.—Sturtevant Engineering Co., Ltd.

Johannesburg.—Council. Tenders for 25 commutators for trams:—

Rand Electrical Co., £37 each; eight in four weeks, balance five weeks later (made in Johannesburg).

British Mining Supply Co., £12 7s. 6d. each; 14 weeks, subject to Ministry of Munitions (made in London, France & Co.).

Hubert Davies & Co. accepted, £11 3s. each; 12 weeks at makers' works, subject to priority certificate (made in England, Duck, Kerr and Co.).

Tenders for 10,000 carbon brushes for tramcar motors:—

Stanton & Co., 28s. each (made in England).

Hubert Davies & Co. (accepted), 3d. each (made in England).

Griffin Engineering Co., 32s. each (made in France).

R. H. Gould & Co., 34s. each (made in France).

Rintoul & Davis, 5s. each (made in France).

Newport (Mon.)—Electricity Committee. E. Green and Son: Alterations and additions to fuel economiser, £711.

New Zealand.—**WELLINGTON.**—The Public Service Stores Tender Board has received the following tenders for 100 miles of 1/18 rubber-insulated wire:—

P. R. Baillie & Co.	accepted	£2,800
Richardson, McCabe & Co., Ltd.		2,397
P. R. Baillie & Co.		2,474
E. W. Cardale		2,585
Tolley & Sons, Ltd.		2,750
F. W. Markmann		3,764
Turnbull & Jones, Ltd.		3,000

* Delivered from Australia.

—N.Z. Shipping and Commerce.

Weymouth.—T.C. Coal for the electricity works:—

G. Bryer Ash.—Best through steam coal, 24s. 9d. per ton; best Writhlington small coal, 21s. 9d. per ton; Gwann Cal Gurwen washed anthracite nuts, £2 2s. per ton; Pontheny washed anthracite nuts, £2 2s. 6d. per ton, delivered free into bunkers.

NOTES.

Federated Labour.—The *Daily Telegraph* states that the organisation of the National Federation of General Workers is now complete. Mr. Clynes, M.P., has been elected president of the Federation; Mr. J. N. Bell (Newcastle), vice-chairman; and Mr. J. O'Grady, M.P., general secretary. The Federation represents a number of labourers' unions, with a total membership of a half a million.

Cleaning Insulators.—In the article published in our issue of June 22nd on this subject, the use of Quebracho was strongly recommended. As this substance—a boiler composition, obtained from Argentina—may not be generally known, we may say that it is obtainable from the sole British agents, Messrs. McArthur & Co., Tower Buildings, Liverpool.

Employment of Disabled Soldiers.—The steps that have been taken by the Institution of Electrical Engineers and other public bodies to provide for the training of disabled fighting men, to enable them to perform the duties of switchboard and substation attendants, have been from time to time recorded in our pages. Needless to say, the training is intended for the benefit of men from the ranks who have not had the advantage of a thorough education and have been rendered unfit to follow their former callings by injuries sustained in the war. We note with surprise, therefore, that a municipal undertaking is advertising for invalid young officers to act as switchboard attendants, at a salary, inclusive of war bonus, of 37s. a week.

Without wishing for a moment to disparage the capabilities and merits of the lower ranks who have suffered for their country, we cannot help feeling that this offer borders upon an insult to the men who have been judged fit to lead their platoons and companies "over the top," who have received a liberal education, and who in civilian life have occupied positions of trust and responsibility. Have we nothing better to offer to our disabled officers than work which, in many cases, is now performed by women after a few weeks' training? And is it right, on the other hand, that the men who have the first claim on such appointments should be put into competition with officers, against whose qualifications they would have no chance?

The proposal appears to us to be in every aspect inappropriate and ill-advised, and we trust that its originators will realise that an error has been made in putting it forward.

An Industrial Training College.—Messrs. Lever Bros. have just established at Port Sunlight a staff training college, which is a model of its kind and an object-lesson to other great industrial concerns. The college has an advisory committee, a competent principal, and a board of studies consisting of experts.

The scheme has the unique feature of training the staff in the firm's time, instead of in the evening in the employé's time. One branch of the college comes under the head of technical and the other commercial. The technical branch has a staff of experts dealing with electrical matters, building, chemistry, engineering, and printing, the sub-sections including teachers in drawing, mathematics and physiography. On the commercial side there are expert teachers in accountancy, finance, buying and selling, and secretarial practice, the subjects under this branch including English, correspondence and office routine, commercial geography, arithmetic, typing, shorthand and book-keeping. The college staff consists altogether of 28 under the direction of Principal J. Knox, M.A. We hope that Messrs. Lever Bros.' example will be followed by other large industrial establishments.—*Daily Chronicle*.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W.

Orders for the week, by Lieut.-Colonel C. B. Clay, V.D., commanding:—
Officer for the week, Platoon Commander P. Bowden.

Monday, July 30th.—Technical instruction (searchlight) for No. 3 Company, Right Half Company, at Regency Street. Drill, No. 3 Company, Left Half Company. Signalling Class. Recruits' Drill, 6.30.

Tuesday, July 31st.—Lecture, 6.30. Physical drill and bayonet fighting, 7.30.

Wednesday, August 1st.—Drill and elementary bridge construction, No. 1 Company, Left Half Company.

Thursday, August 2nd.—Drill and elementary bridge construction No. 2 Company, Left Half Company. Ambulance Class.

Friday, August 3rd.—Technical instruction (searchlight) for No. 3 Company, Left Half Company, at Regency Street. Drill, No. 3 Company, Right Half Company. Signalling Class. Recruits' Drill, 6.30.

Saturday, August 4th, to Monday, August 13th.—A camp will be held at Esher from August 4th to 12th. Parade at Waterloo, opposite No. 10 Platform, on Saturday, August 4th, at 2 p.m.

Headquarters.—Headquarters at Balderton Street closed August 4th to 12th. Headquarters will be transferred to Clarendon Park, Esher, for that period.

Holiday Addresses.—These must be given in to the Orderly Room without fail.

MACLEOD YEARSLEY, Company Commander and Adjutant.

Electric Taxicabs in the U.S.A.—The most recent installation of electric taxicabs, which have met with phenomenal success in Detroit, is in St. Louis, where six cars make up the nucleus of a fleet. The clean, silent, smooth-running, attractive electric taxicab has made a strong and immediate appeal, and has proved itself to be extremely well fitted for this service, especially because of its low operating costs and its simplicity of operation through congested streets, ensuring safety to its occupants. The mileage of these "electrics" is practically unlimited, as facilities

ELECTRIC TAXICABS IN ST. LOUIS.

for curb "boosting" are provided in various parts of the city, so that the battery may be charged while it is waiting, even though it may be only a few minutes.

The Electric Vehicle Section of the National Electric Light Association is advised that an electric taxicab company is now being organised in Mexico City, and it is interesting to note that whereas the electric taxicab met its first success in Detroit, the home of the gasoline car, it is now to compete with the gas car in the vicinity of hundreds of oil wells.

Apart from the generally appreciated virtues of the electric taxicab, it is cosmopolitan, for we also find it in successful operation in Shanghai, China, where it has to a great extent replaced the quaint and quite inexpensive jinricksha.

Progress is being made in the provision of an initial fleet of about 500 electric taxicabs of the most advanced type, which it is intended to install in New York City.

Westinghouse Turbo-Alternators.—With reference to our article on this subject in our last issue, we find that the endeavour to squeeze the essence of the pamphlets reviewed into the space at our command has resulted in a loss of accuracy in the following respects:—While the British Westinghouse Co., as stated, have taken out licences to manufacture under the Rateau patents, and have adopted the impulse principle for their standard machines, the American Westinghouse Co. still manufacture the "drum and disk" type. In cases where no advantage is to be gained by the use of the velocity wheel on the high-pressure end of the turbine, it is not provided, the turbine rotor then consisting throughout of wheels having single rows of blades. The over-speed device not only closes the main governor valve by releasing the oil pressure in the relay cylinder, as stated, but also trips the external stop valve, which is shut down by a spring. The statement that small turbines can compete with the high-speed steam or gas engine in price and efficiency, which we reproduced from the pamphlet, requires modification; the makers now point out that such machines present many advantages when used on board ship or for driving auxiliaries in large power stations, since they do not require internal lubrication, the exhaust steam is therefore free from oil, and the heat contained in the exhaust can be most advantageously utilised in a feed heater. But apart from this, considered independently on their merits as producers of power, small turbines of the type in question are not considered as economical as high-speed steam or gas engines.

Department of Scientific and Industrial Research.—The offices of the above Department (including the Fuel Research Board) have been removed to 15, Great George Street, S.W., which is nearly opposite to the Department's present offices. Telegraphic address: "Resciendus, Parl., London." Official telephone number as before—Victoria 7910 (two lines).

Electric Light Switching.—Messrs. Lundbergs' examinations have the advantage that the papers may be worked at home, in camp, or on board ship, whenever there is any available leisure. Any of these papers may be had on application to the firm at 477—489, Liverpool Road, London, N. 7, and the answers may be submitted as soon as worked. The papers are revised from time to time, and we have just received a new Intermediate Grade paper which, we are told, contains an entirely fresh set of problems. There are 12 questions in all, and as the examinee is not allowed to tackle more than nine of them, and need only attempt seven, he has a wide choice.

The Wild-Barfield Steel-Hardening Process.—The Wild-Barfield patent process of steel hardening as worked by the Westminster Electrical Testing Laboratory, to which we recently referred, was described in the last issue of the *American Machinist*. Electrical resistance furnaces are used; the gauge or other article is heated in one bath and quenched in another, special salts being used in each case. The heating bath has both an ordinary heating coil and in addition an outside winding of small-diameter wire, which is simply connected direct to a galvanometer. The main winding, besides forming a source of heat, also magnetises the object to be hardened. The temperature required is determined approximately by means of a thermo-couple pyrometer. Quenching does not depend on this, however, but on the firm's pyroscopic detector. At the temperature correct for quenching, carbon steel becomes non-magnetic, and the collapse of the magnetism produces an electromotive force in the outer winding, and thus

causes a deflection of the galvanometer needle, the deflection persisting for the whole time during which the steel is passing through the decalescence temperature. As soon as the galvanometer needle returns to zero, the steel is removed from the heating furnace and quenched. By heating the steel quickly in the bath, the minimum of surface decarbonisation and oxidation occurs, with also the minimum of viscous flow on the surface of the article, and therefore of change of form. The quenching mixture employed has a high vaporising point, and therefore does not produce vapours, giving even cooling with even hardening effect and prevention of distortion. This, of course, contrasts with the use of water for the same purpose, the water giving off steam. The furnace takes 1,300 watts when fully at work and 600 watts standing, and this, with energy at 1d. a unit, is said to work out at about 2s. a day, continuous working. The furnace shown at a recent demonstration takes articles up to 2 in. diam. The demonstration was made in connection with the hardening of a thread gauge of about $\frac{1}{4}$ in. diam., the time required in the heating bath being 1½ min. Ganges can be used practically direct from the bath, requiring no special cleaning, and the only visible effect of hardening is to render them black instead of bright in appearance.

Sentence.—At the Acton Police Court, last Friday, Harry H. Sheppard, 45, an electrical engineer, was sentenced to four months' imprisonment with hard labour for stealing electric fittings valued at £70 8s., the property of his employers, Messrs. C. A. Vandervell & Co. Defendant had been in the firm's service for a year and 10 months, and his wages, with war bonus, were £4 6s. per week. He was in the employ of the Sheffield Corporation for some years, and had never been in trouble before. The goods were taken for his small business at Hammersmith, and his friends attributed the present case to worry, trouble, and illness in his family.

B. of T. Committee on Electrical Supply.—The Association of Municipal Corporations has sent out a circular letter with regard to the B. of T. Committee on Electrical Supply. The Association states that three witnesses have been nominated by the Association to give evidence before the Committee, from the city of Leeds and the boroughs of Blackburn and Sutton Coldfield respectively, the inquiry being obviously one of great importance to those municipalities who own electrical undertakings, and points out that the following, amongst other questions, will probably come under consideration:—(a) The question of forming entirely new and large areas of supply and distribution, irrespective of existing municipal boundaries; (b) the question of the constitution of the managing body to deal with the supply in each of these areas. The Association asks to be furnished with any observations which Councils think would be useful for their witnesses to have.

Air Raid Warnings.—Writing to the *Times*, Mr. W. H. Allen says that when it is determined whether sounds or scenes should prevail, there will be no difficulty about the former. Steam is absent from the City and County of London, while electric current is everywhere. A large diapason tube with a touch of gamba in it, supplied with compressed air from a motor-driven compressor, will reach large areas, and can easily be put up in the fire stations of the various municipalities.

Prohibited Exports.—The supplement to the *Board of Trade Journal* of July 26th contains complete lists of articles which, according to the latest information received by the Board of Trade, are prohibited to be exported from the Straits Settlements, Hong-Kong, Nigeria, Jamaica, Barbados, Trinidad and Tobago, and British Guiana.

Symbols for Electrical Tenders.—In accordance with a report of the City Electrical Engineer as to the method of comparison of the merits of tenders received for the supply of electrical plant, involving a valuation of a difference in electrical performance, the Sydney Municipal Council has approved of the following as an equation to express the relation between the capital expenditure and the annual cost involving the variables which enter into the calculation:—

$$x = y \left[\frac{(1 + b)^n - 1}{b - a + a(1 + b)^n} \right]$$

in which the symbols have the following significance:

- x = the capital sum, *i.e.*, the excess capital value of the higher-priced apparatus.
- y = the annual excess cost of using the less efficient apparatus.
- n = the number of years estimated to be the life of the apparatus.
- a = the rate of interest payable for loans at the date of purchase, expressed decimally (*i.e.*, 5 per cent. would be expressed as '05).
- b = the rate of interest obtainable on sinking funds.

Post-War Foreign Trade Competition Measures.

Ever since the European war started in the summer of 1914, says the *Electrical World*, countless rumours have gone out regarding the action that was to be taken by German industries in foreign trade after the war was over. The most persistent rumour has been that German goods would be dumped upon the markets of the world in such quantities as to flood them.

The dye manufacturers of the world know full well the methods employed by the German dye manufacturers to secure the control of the dye industry of the world. It amounted to nothing more or less than putting German goods on foreign markets to be sold at a price less than it cost the domestic manufacturer to produce goods of similar quality. Of course, the German manufacturers were losing money on the transaction, but they had prepared for it for a long time, and had laid up a reserve to be used for just such a campaign. As a result it was not long before the German manufacturers had this market in their control, and when the war broke out the world found itself at a loss to secure sufficient materials of this character.

Recent investigations show that the German electrical manufacturers have undoubtedly something of the same kind in mind for foreign trade competition after the war is over. It is now definitely known that certain of the more important German electrical manufacturers have since the war began been accumulating large surpluses designated as reserves to be used in after-the-war commerce.

Right now American and English manufacturers are enjoying practically the entire foreign trade of the world in electrical goods, but their prices are high, particularly those of American-made goods. The American foreign trade in electrical goods has virtually doubled since the war began. In order to retain this trade after the war German competition will have to be met, and if the above indications are finally borne out, then it becomes evident that American manufacturers must employ some similar measures in order to protect their interests in foreign trade as soon as the war is over. American manufacturers are now enjoying a larger business than ever before, and are in a position, generally speaking, to lay aside sufficient reserve for just such a contingency.

Educational.—UNIVERSITY OF MANCHESTER.

—We have received the prospectus of University courses in the Municipal School of Technology for the session 1917-18. Prof. Miles Walker is head of the Department of Electrical Engineering, assisted by Mr. J. L. Langton and Mr. A. E. Moore. The electrical equipment includes four 100-kw. steam dynamos and a 50-kw. turbo-generator, 100 motors aggregating 1,250 H.P., and a large number of experimental generators, motors, rotary converters and transformers, besides an ample equipment of instruments, &c.

Wire Lamp Patents in Germany.

—It is reported in the German newspapers that the Imperial Court has now given a definite decision in favour of the A.E.G. in the matter of Patent 269,498 for the manufacture of wolfram (tungsten) wire for lamps. The company in question acquired the patent for Germany some years ago from the United States General Electric Co., and then made an interchange of working rights with the Siemens & Halske Co. and the Auer Co., whilst a licence was subsequently granted to the Bergmann Co. The validity of the patent was contested by a competitive group consisting of the Pintsch Co., the Radium Co., the Bergmann Lamp Co., &c., and the proceedings have extended over a period of five years. As mentioned, the highest Court has now maintained the validity of the patent, and dismissed the application for a declaration of nullity. The Pintsch Co., as recently reported, has entered into a price agreement with the other companies controlling the patent for drawing thin tungsten wire, capable of being easily wound on formers, and other companies have also given their adhesion to the scheme.

Economies Effected by Electricity in Industrial Heating.

—In a doll factory at Chicago three 39-kw. electric drying ovens have been installed to drive moisture out of doll heads and bodies after they have been moulded from a plastic composition. This installation shortens the drying time from three or four days to one hour. The method previously used was air drying. It was impossible to use gas, owing to explosive vapours given off from

the plastic composition. Steam heat was out of the question on account of its inability to give sufficient high temperatures. The installation of electric ovens eliminated the work of eight girls, who were paid \$7 per week each. Electric heat also gave a much better product.

In a factory engaged in making paper roofing, an application of heat was necessary to join the ends of the paper passing through the process of manufacture. At first three tailors' irons were used for applying heat to the joint; with this process it was necessary to stop the machinery for five or six minutes. A home-made heating unit has replaced the irons. This consists of a large block of iron kept at a constant temperature by electric heat. Formerly, when the roofing machinery was stopped for the joining operation the parts remaining in the hot liquid, colouring liquid, or sand received a surplus of this material, thus materially reducing the quality of the roofing, which consequently had to be sold at a lower price. The installation of the iron block made it possible to complete operations without stopping the machinery. This contrivance, while it did not reduce labour charges, materially increased the production and also the quality of the goods. Three of these heaters are in use; two are rated at 18.5 kw. and one at 16 kw.

A third installation which is proving quite successful is a 236-kw. conveyor-type oven about 80 ft. (24 m.) long. It is used for jappanning automobile parts, and supplanted gas equipment; it is showing a consumption of 9 kw.-hours per 100 lb. (45.35 kg.) of metal baked, and still better results are expected when the workmen become more proficient in handling it. When the change from gas to electric heat was made the number of workmen required was reduced by six. A. F. Allsop, in the *Electrical World*.

Trade Openings.—The Department of Commercial Intelligence of the Board of Trade has received applications for the names of British manufacturers or producers of the following (amongst other) articles:—

- Carbon electrodes.
- Diamond dies for wire drawing.
- Boilers designed for using peat as fuel.
- Gas generators designed for peat.
- Machinery for excavating and generally handling peat.

Saving Labour on Pole Holes.—In the June issue of the *Telephone Engineer*, Mr. J. B. Stoneking describes the use of explosives as a substitute for digging in various sorts of soil. His attention was first called to the practicability of the dynamite method of hole digging by an old miner on some telephone line construction in Montana, where the men were paid a certain sum per hole. The soil was a clay loam slightly moist, but firm enough to require barring in digging the material. A bar was driven 30 in. into the ground to make a hole for the dynamite, from $\frac{1}{4}$ lb. to $\frac{1}{2}$ lb. of which was used per hole, generally without tamping, but in some cases in more compact material a short plug of wet clay was used. A bridge of earth was left over the cavity formed by the explosion, but a few blows with a shovel eaved this in, and the debris was removed from the bottom. A good hole from 10 to 14 in. in diameter and from 3 to 3½ ft. deep, when cleaned, was obtained, the sides and bottom being well compacted. The miner was enabled by this means to complete nearly twice as many holes per day as any other man in the digging crew.

Later trials in different soils have shown that what is a good loading practice for one condition does not always hold true for others, and it is necessary to shoot a few holes in order to arrive at a correct loading.

Better results have been obtained by removing the top earth to a depth of several inches and to the diameter of the pole hole desired before making the bore hole for the dynamite. This has the effect of relieving the pressure and diminishing the formation of the bridge over the cavity. In making the holes for the dynamite a punch bar driven by hammers, a soil auger with a long handle, or a churn drill is generally used, although a large telephone company uses a specially made hollow pipe which is churned up and down, doing very effective work in the soil, enough water being used to make a thin mud.

For deeper work, up to 6½ ft., very good drills are made by tying small pieces of from one-eighth to one-half cartridge to a small straight lath or stick, starting at the bottom end and spacing them about 6 to 12 in. apart, leaving the last piece about 18 to 24 in. below the top of the ground. This distributes the charge along the entire hole and packs the earth tightly against the sides, leaving a cavity from 12 to 18 in. in diameter. Sometimes the dynamite is inserted into a long roll or cylinder of heavy stiff paper, and held in place by sticking pins through it, or by cutting short sticks the length it is desired to space the cartridges. Care should always be taken not to allow earth to fall into and close the hole between the cartridges, for this has a tendency to break the detonating wave from one cartridge to another, and may result in misfires.

Ordinarily no tamping is necessary, but for harder material a small amount of tamping has the effect of confining the gases formed in the explosion and forcing them to do more work laterally. Tamping generally leaves a bridge over the cavity. By varying the size of the cartridges, the spacing apart along the hole, and the amount of tamping, in a few trial holes the engineer is able to obtain a system of loading to fit almost any conditions.

Due to the wide adaptability and elasticity of this method of digging holes, the quickness, absence of high first cost for equipment and overhead charges for maintenance, and low cost per hole, as compared to hand labour, it has met with much favour from engineers and contractors who have given it a thorough trial.

Appointments Vacant.—Shift engineer (63s.) for the Stalybridge, Hyde, Mossley and Dukinfield Tramways Board; draughtsman, engineering clerk of works (£285 + £15 bonus), assistant engineering clerk of works (£5 per week), and an electrical engineer (£5 per week), for a large power station; invalid young officers wanted to act as switchboard attendants in an electricity generating station (25s. + 12s. war bonus); switchboard attendant for the Stepney B.C. Electricity Department. See our advertising pages to-day.

Institution and Lecture Notes.—Diesel Engine Users' Association.—The June meeting of the Association was held during the week in which the Incorporated Municipal Electrical Association was holding its meetings in London. This arrangement had been made for the convenience of engineers in the provinces, who in some cases are members of both Associations, and who, in consequence of being at a long distance from London, may not have frequent opportunities of attending to discuss Diesel engine matters. There was a large attendance, including a few visitors interested in the Association's work who had been invited by the Committee to attend on this occasion. The election of several new members and "subscribers" was announced.

The result of the lengthy negotiations with the Inland Revenue authorities in the matter of the allowance for depreciation of Diesel engines for income-tax assessment was reported. The new rate allowed for this purpose for Diesel engines is 10 per cent., and this increased allowance is to remain in force for three years after the cessation of the war, when either party is to be at liberty to claim a revision.

Considerable interest had been aroused by Mr. Geoffrey Porter's paper on "Tar Oil Fuel and Diesel Engines," which had been read at the previous meeting, and in the course of the discussion which took place at this following meeting a further amount of useful information on the subject was forthcoming. In response to requests received from several quarters, the president announced that reprints of the report by Dr. E. Graefe on "The Influence of Sulphur in Liquid Fuels in Internal-Combustion Engines," which had been circulated among the members in February, 1915, would again be sent out to members and "subscribers" of the Association.

Illuminating Engineering Society (U.S.A.).—The Council has decided that any Member or Associate Member of the Society in good standing when entering the military or naval service of the United States, or any of its Allies, may upon request before October 1st, 1917, or if called out after that date, have his name retained upon the Membership Roll of the Society without payment of dues, during the year ending September 30th, 1918. The Council has invested \$1,000 in United States Liberty Bonds.

In lieu of the regular Annual Convention, which has been abandoned, the Society will hold a "Correspondence Convention," during which the papers prepared for this Annual Convention will be circulated, and written discussions on these papers may be submitted for publication. Any who are interested in such papers may receive a copy and submit discussions upon application to the General Offices of the Society, 29, West 39th Street, New York, N.Y.

Society of Engineers.—The balance-sheet for the year 1916 shows an excess of assets over liabilities of £753. The income was £673 and the expenditure £700, showing a deficit of £27.

Railway Employees' Wages, &c.—The Executive Committee of the Associated Society of Locomotive Engineers and Firemen was to meet the Railway Executive in London, on Tuesday, to discuss a programme of a universal eight hours' day for locomotive men; 14s. a day for drivers and electric motormen; 10s. a day for firemen; and 7s. a day for cleaners, with a sliding-scale arrangement to provide for any further increase in the cost of living.—*Times*.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—Exeter T.C. has rejected a proposal, by the Electricity Committee, to increase the salary of the engineer, Mr. H. D. MUNRO, from £475 to £550 a year.

Southwark Council's Electric Light Committee reports that it has received a report from Mr. D. M. KINGHORN, the electrical engineer, to the effect that on the National Service Act coming into operation, followed by the appeal to municipal officials to enrol, he offered his services to the Government, with the result that he has now been offered the position of general manager of an assembly station by the Trench Warfare Supply Department. The position is of great national importance, and he asks for the necessary permission of the Council to accept it. The Committee gave the matter very careful consideration, and, having regard to the whole of the circumstances surrounding the application, feels that it is one which it would not be advisable in the interests of the Council generally to grant. It has accordingly refused to grant the permission.

Grays U.D.C. has granted a war bonus of £20 a year to Mr. E. D. LONG, electrical engineer.

Bury Corporation Electricity Committee has congratulated Mr. S. J. WATSON, the borough electrical engineer, upon his election as President of the Municipal Electrical Association for the ensuing year.

Ashton-under-Lyne T.C. has increased the salary of Mr. W. A. WALES, chief assistant engineer in the electricity department of the Corporation, by £50 per annum. All officials of the Corporation in receipt of salaries under £300 a year are to have an increase or war bonus of 10 per cent.

Mr. C. H. MANNING desires to relinquish the duties of traffic superintendent under Preston Tramways Committee.

The salary of Mr. A. ASPINALL, electrical engineer to the Frithgouse Corporation, is to be increased from £160 to £169 per annum, as from April 1st.

General.—Mr. W. T. TARLETON, a member of the British Westinghouse staff in Johannesburg, and eldest son of Mr. W. I. Tarleton, mains superintendent of the Corporation electrical department at Cape Town, has joined the South African Field Artillery.

Mr. H. P. GIBBS, general manager of the Tata Hydro-electric Scheme in Bombay, has left for America on seven months' leave, and has given up the position of consulting electrical engineer to the Mysore Government. Mr. S. C. FORBES, chief electrical engineer in Mysore, having returned from leave, has taken over charge from Mr. S. D. SESHADRI IYENGAR, the chief operator from Sivasamudram.—*Indian Engineering*.

Mr. A. A. CAMPBELL SWINTON, F.R.S., has been elected chairman of the Council of the Royal Society of Arts.

According to the *Morning Post*, Mr. ROBERT MOLESWORTH KINDERSLEY has joined the board of the Eastern Telegraph Co., Ltd.

It is stated in the Press that previous to the changes in the Government, Dr. Addison had invited Sir Thomas Munro, County Clerk of Lanarkshire, to accept the position of Chief Director in the Labour Regulation Department of the Ministry of Munitions, in order to supervise the work in connection with general labour matters affecting wages and disputes, and, in particular, the formation, as soon as possible, of representative committees of employers and workpeople.

Roll of Honour.—Captain JAMES ANDERSON, K.O.Y.L.I., aged 28 years, who has died of wounds, was an electrical engineer.

Sergeant D. LAWRIE, who was an electrical engineer in Glasgow, is now officially presumed to have been killed in action. He had previously been posted as missing.

Private A. FRASER, Highland Light Infantry, who was formerly a conductor on the Glasgow Corporation tramways, has been awarded the Military Medal.

First-Class Wireman F. J. MARSHALL, lost by the blowing up of H.M.S. *Vanguard*, was, before joining the service, with Mr. J. Richards, electrical engineer, of Burton-on-Trent.

Lieutenant O. J. T. RUNGE, Machine Gun Corps, reported killed on October 15th, was formerly with Messrs. Fraser and Chalmers, of Erith. He came home from Montreal to enlist on the outbreak of war. He was awarded the Military Cross in June, 1916.

Private R. A. TAY, Royal Warwickshires, aged 22, who has been killed in action, was an electrician at the Jubilee Pits, Sandwell.

Corporal A. FEATHERSTONE, Manchester Regiment, awarded the Military Medal, was an employé of Messrs. C. Macintosh and Co., Ltd., electric wire and cable manufacturers, Manchester.

Private C. HAMPSON, Manchester Regiment, killed in action, was also employed by Messrs. C. Macintosh & Co., Ltd.

Fitter F. H. DAVIES, R.G.A., killed in action on July 5th, was employed at the Hulme Electric Works, Manchester.

Lieutenant H. BUTLER, R.F.C., killed, was on the staff of Messrs. Dick, Kerr & Co., Ltd., of Preston.

Obituary.—Mr. A. MOSELY.—We regret to record the death of Mr. Alfred Mosely, C.M.G., which occurred on Sunday, at the age of 62 years. It will be remembered that he organised an Industrial Commission to the U.S.A. in 1902, and an Educational Commission in 1903.

Sir C. S. MILBURN.—The late Sir Charles Stamp Milburn was a director of the Newcastle & District Electric Lighting Co., Ltd.

Mr. R. ROWLAND.—The death took place on July 7th of Mr. Richard Rowland, mains superintendent at the Peterborough Corporation electricity works. He was 37 years of age, and was brother of the acting engineer of the works, Mr. T. Rowland.

NEW COMPANIES REGISTERED.

Karting Bros. (1917), Ltd. (148,041).—Private company. Registered July 21st. Capital, £15,000 in £1 shares. Founders, electrical, mechanical, gas, heating, and ventilating engineers, &c. The subscribers (each with one share) are: F. G. Kerly, 10-11, Austin Friars, E.C., solicitor; H. Glenister, 28, Egerton Gardens, Hendon, N.W., solicitor's clerk. The first directors are: F. A. Robinson, E. H. Beckett, and O. Lindemann. Registered office: 53, Victoria Street, W.

Alfred Herbert (Russia), Ltd. (147,920).—Private company. Registered July 10th. Capital, £25,000 in £1 shares. To carry on in Russia, or elsewhere in Europe, Asia, the United Kingdom, the United States, and Canada the business of buying, selling, manufacturing, repairing, and letting on hire machinery, machine tools, plant, motor cars and cycles, electrical, hydraulic, and mechanical engineers, &c. The subscribers (each with one share) are A. Herbert, Dunkley Manor, Whitechurch, Hants, chairman of Alfred Herbert, Ltd., Coventry; H. C. Chambers, Harn, Blakesley Road, Yardley, Birmingham, solicitor's managing clerk. Permanent governing director: A. Herbert. Solicitors: Pinsent & Co., 6, Bennett's Hill, Birmingham.

National Union of Manufacturers, Incorporated (147,967).—Registered July 13th by Moreton, Phillips & Son, 11-12, Finsbury Square, E.C., as a company limited by guarantee, not formed for purpose of profit. The word "Limited" is omitted from the title by licence of the Board of Trade. The number of members is unlimited, and each member is liable for five guineas in the event of winding up. Objects: To undertake all or any of the liabilities and assets of an unincorporated association known as the British Manufacturers' Association, 1915, whose principal office is at 11, Paternoster Square, E.C., to promote the home, colonial, and foreign trades and industries of the United Kingdom, to encourage free intercourse between masters and workmen, to render pecuniary, legal, and other assistance to small essential industries in case of need (provided that no such assistance shall be given to members of the Association, and that the laws relating to charity and maintenance shall be observed), to collect and disseminate statistical and other information, &c. The management is vested in an executive council. President, G. Terrell, M.P. (Tyler & Co., Ltd.); deputy-chairman, R. L. Mathews (W. J. Turner & Co., Ltd.); treasurer, J. Walker (John Walker & Co., Ltd.). Solicitors: Moreton, Phillips & Son, 11-12, Finsbury Square, E.C. Secretary: G. W. Cheesman. Registered office: 11, Paternoster Square, E.C.

British Ignition Apparatus Association, Ltd. (148,001).—Private company. Registered July 18th by A. R. Monks, 123, Cannon Street, E.C., as a company limited by guarantee, with not more than 50 members, each liable for £1 in the event of winding up. Objects: To promote and protect the interests of manufacturers of ignition apparatus in the United Kingdom, to conduct and assist in experiments, to promote the standardisation of quality and form of ignition apparatus, and the adoption of equitable forms of contracts, &c. The subscribers (each with one share) are: P. F. Bennett, Ardencote, Four Oaks, manufacturer; R. B. North, St. Willfred's, Magden Lane, Walford, manufacturer; G. A. Lister, Coundon Road, Coventry, engineer; W. A. Anderson, 94, West Road, Westcliff-on-Sea, company secretary; G. H. Woods, 2, Norfolk Street, W.C., engineer; E. Garton, Tralee, Kenilworth, engineer; M. C. Lusk, 83, Cannon Street, E.C., manufacturer. The first members of the governing committee are to be appointed at the first general meeting. Registered office: 29-34, Mansion House Chambers, E.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Tyne Electric Steel Foundries.—Issue on June 19th, 1917, of £200, and on June 25th of £100 debentures, part of a series of which particulars have already been filed.

South Metropolitan Electric Light & Power Co., Ltd.—Second debenture dated July 18th, 1917, to secure £50,000 charged on the company's undertaking and property, present and future, including uncalled capital. Holder: Minister of Munitions.

CITY NOTES.

British Thomson-Houston Co., Ltd.

In their report for 1916, the directors refer to the completion of the canteen and works extension at Willesden, and to the fact that a canteen is approaching completion at the Rugby works. Owing to further dilution of labour and the absence of employés who were familiar with the stocks, it was not possible to take an inventory at the Willesden factory and at the Rugby main factory, so that book figures had been relied upon. The usual complete inventory was taken at the other factories and branch offices. As stated last week, the profits, after deducting all expenses and charges other than debenture and loan interest, were £359,364, plus £73,359 brought forward. £50,000 is required for excess profit duty and munitions levy and for increased depreciation to the end of 1915. The reserve *re* raw materials made at December, 1915, has not been required, and has been written back. Interest on debentures and loans for 1916 has absorbed £70,100, and there is to be appropriated for depreciation £153,700 (depreciation of goodwill, patents, and licences £40,636; depreciation of plant, £103,715; depreciation of shares and debentures, £4,589; and depreciation of apparatus, supplies, and meters, &c., £4,759). £163,923 is being carried forward subject to the deduction of munitions levy for 1916, the amount of which has not yet been ascertained. [For 1915 the profit was £262,361, interest was £57,922, and depreciation appropriations were £144,878.] The total par value of debentures returned to date is £38,505, and the net amount outstanding to date is £173,495. The usual practice has been followed in making reserves to cover risks in connection with bad debts and other contingencies. The report refers to the death of Sir George Franklin (a director for 18 years), and to the resignation of Mr. J. F. Nanheim (a director for 20 years), and Mr. E. Thurnauer, who for 21 years had represented the French shareholders, does not now stand for re-election. Mr. H. C. Levis, the managing director, has been appointed chairman. 152 employés have fallen in the war, 138 have been wounded, 102 have received commissions, 27 have won special honours, 9 have been mentioned in dispatches, and 11 have been specially commended for service in the field. A permanent memorial tablet, containing the names of all who have died in active service, will be erected at the end of the war.

Clevedon, Portishead & District Electric Supply Co., Ltd.—At the annual meeting, the directors reported a satisfactory growth of the undertaking, in spite of the very difficult conditions prevailing, the gross revenue being more than double that of the previous year. The number of consumers connected in Portishead has been increased from 179 to 193, and the sub-station at Bowyer Ashton is supplying power to the South Liberty Colliery and the Ashton Vale Brick Works. The extension of mains through Long Ashton village is almost completed, and a number of consumers have been connected. The total receipts on revenue account amounted to £3,965, compared with £1,737 last year. Notwithstanding the increased cost of fuel and all other expenses, the gross profit is £224, compared with £696 last year.

North Melbourne Electric Tramways & Lighting Co., Ltd.—The gross receipts show an increase from £33,162 to £40,358. The expenses principally due to increased wages and high cost of materials and freight, factors which, unfortunately, show no sign of disappearing—increased from £21,730 to £28,888, the net revenue therefore being £11,170, as compared with £11,732 for the previous year. Capital expenditure amounted to £1,917. A contract has been entered into with the Melbourne City Council for the lighting of Flemington and Kensington. The necessary work of laying the mains and erecting the standards is being proceeded with as rapidly as possible.—*Financier*.

Eastern Extension, Australasia & China Telegraph Co., Ltd.—Owing to delays arising from the war in obtaining the necessary returns from foreign stations and administrations it will be impossible to present the accounts and balance sheet, duly audited, for the year 1916 to the shareholders until the autumn. As, however, it is necessary, under the provisions of the Companies' (Consolidation) Act, 1908, to hold a general meeting within 15 months from the date of the last preceding meeting, the directors convened an extraordinary general meeting, which was held on 17th inst., Sir J. Wolfe Barry presiding. The proceedings were purely formal.

Greenwood & Batley, Ltd.—The report for the period from July 12th, 1915, to March 31st last states that, after providing for interest on debentures, expenses of management, doubtful debts, the writing down of war capital expenditure, and the company's anticipated liability under the Finance Acts, there is a profit of £119,242. The directors have appropriated £45,000 for depreciation and £13,000 to reserve account, and recommend that a final dividend on the ordinary shares of 15 per cent. (that is, 30s. per fully-paid share and 15s. per £5 paid share).

Crompton & Co., Ltd.—The issue of the accounts for the year ended March, 1917, has been postponed pending the settlement with the Ministry of Munitions of various matters connected with the "control" of the business. The profits for the year justify the dividend of 5 per cent. per annum on the ordinary (and 7 per cent. on the preference) shares. The works continue to be fully employed on orders of national importance. Meeting: August 1st.

South Brazilian Railways Co., Ltd.—In their report, the directors show that there was a loss on the Curitiba tramways undertaking of £2,856, and a net profit of £12,472 on the electric light and power undertaking, leaving the net earnings £9,616. Of this £5,218 has been paid to the unsecured creditors, £773 has been put to accident damages account, and interest on debentures is to be paid at 2s. 11d. per £20 debenture for the year 1915-16.

France.—La Société Hydro-Electrique et Metallurgique du Palais is the name of a new company which has recently been formed in Paris, with a capital of £200,000, to establish new electrometallurgical works. The Société d'Electro-Metallurgie de Dives is interested in the new undertaking.

General Electric Co., U.S.A.—The "Times" New York correspondent states that this company has just issued \$15,000,000 of three-year 6 per cent. notes, which have been offered to the public at 99½.

Liverpool Overhead Railway Co.—Interim dividend for June half-year at the rate of 5 per cent. on the preference and 2½ per cent. per annum on the ordinary, less income-tax 5s. in the £.

South American Light & Power Co., Ltd.—After paying 5 per cent., less income-tax, for 1916, £2,000 is written off discount on debentures, and £3,696 is to be carried forward.

Kaministiquia Power Co.—Quarterly dividend, \$1¼ per share (seven per cent. per annum).

Anglo-American Telegraph Co., Ltd.—Interim dividend for the quarter, 15s. per cent. on the ordinary stock, and £1 10s. per cent. on the preferred stock, less income-tax.

Bournemouth & Poole Electricity Supply Co., Ltd.—Interim dividend on the ordinary shares at the rate of 5 per cent. per annum, less tax, for the half-year ended June 30th.

Electrical Utilities, Ltd.—A dividend of 1½ per cent. on the preferred stock is announced.

City of Buenos Aires Tramways Co. (1904), Ltd.—Dividend of 1s. 3d. per share, less income tax, for three months ended June.

London Electric Railway Dividends.—*Central London Railway Co.*—Interim dividends for the six months ended June 30th on the undivided ordinary stock of 1½ per cent., and on the preferred ordinary stock of 2 per cent.

London Electric Railway Co.—Dividend for the half-year at the rate of 2 per cent. on the four per cent. preference stock and ½ per cent. on the ordinary shares.

City & South London Railway Co.—Dividends of 2½ per cent. on the five per cent. preference stocks, 1891, 1896, 1901, and 1903, and 1 per cent. on the ordinary stock for the six months.

Metropolitan District Railway Co.—Interim dividends for the six months ended June 30th on the four per cent. guaranteed stock of 2 per cent., on the first preference stock of 2½ per cent., and on the second preference stock of 1½ per cent.

Underground Electric Railways Co. of London, Ltd.—Interest on the six per cent. first cumulative income debenture stock, less tax, at 3 per cent., and coupon No. 19 off the six per cent. income bonds, free of tax, at 2 per cent.

Trowbridge Electric Supply Co., Ltd.—The result of working for 1916 is a profit of £546. Dividend, 7½ per cent. on ordinary shares, 5 per cent. on preference. To depreciation £225, to reserve £75, carried forward £56. The output of electricity has increased considerably, due in part to new consumers for lighting, but mainly to heavy day loads for power purposes, in addition to an all-night supply.

Spain.—A new company has recently been organised in Madrid with a capital of no less than £1,000,000, and the title *La Sociedad Espanola de Construcciones Electro-Mecanica*, to establish works near Cordoba for the electrolytic manufacture of copper and also electrical material. The *Schneider Co.*, of Le Creusot, France, and a number of the leading Spanish iron and steel companies are interested in the new undertaking.

STOCKS AND SHARES.

TUESDAY EVENING.

Stock Exchange markets are overshadowed by the news from Russia. That this should cause a certain amount of depression is only natural, but the depression is noticeable more in the way of a check administered to business than in any violent fall in prices. The Russian disappointment is neutralised to some extent by the comforting reflection that every day brings the United States nearer to the firing line with a substantial new army, and this suffices to hold prices reasonably steady. Rumours of a new War Loan continue to be very persistent, and the latest vote of credit taken by the Government has pointed the prophecy of those who anticipate a new issue in the forthcoming autumn. At the same time, many good authorities hold the view that another War Loan is unlikely to appear for some time yet.

The principal feature in the domestic markets is the declaration of Home Railway interim dividends. Of these, the announcement of the Underground Electric Railways Co. occasioned surprise and disappointment, because the market had been looking for 5 per cent., whereas the company declares 4 per cent., the same rate as that of six months ago, but comparing with 6 per cent. this time last year. The dividend on the bonds for the time being, therefore, becomes 1 per cent., and at 80 the return is exactly 5 per cent. on the money, which is equivalent to 6½ per cent., less tax. The price of the bonds has fallen 4 points to 80, and the £10 shares are ½ down at 1½.

The London Electric and the City & South London Companies are paying 3 per cent. on their ordinary stocks, while the District is to distribute 1½ per cent. on the 2nd preference. All three are the same as those of a year ago. The Metropolitan dividend comes out on Thursday in this week. The market as a whole is inclined to be reactionary, following the course of Consols, which have given way from the highest point touched last week. Metropolitan fell ½; Districts followed suit. But Central London Assented ordinary has gained a point.

The telegraph and cable market is uniformly good. Further advances have been obtained by the higher-priced stocks and shares, and notwithstanding the dulness of investment securities generally, in this particular section there is certainly no set-back. The telegraph market is one of those in which current quotations stand as a rule higher than the levels current on the outbreak of war. For instance, Eastern Telegraphs at 141½ and Eastern Extensions at 141 show rises for the three years of 11½ and 1½ respectively. Globe Ordinary at 12½ are 27s. 6d. up, although the preference at 10½ show a fall of 2½, fixed interest shares having, of course, suffered in sympathy with Consols, the price of which has come down from 72½, at which it stood on the outbreak of war, to 55½ to day. Anglo-American preferred at 99 is 9½ down over the three years, another instance of the way in which the price of fixed-interest stocks have fallen, while Westerns at 14½ are £1 up, and Panamas at 31s. 3d. show a rise of 6s. 3d. The principal improvement in this market, comparatively speaking, is that secured by Marconis, the ordinary shares having risen from 1½ on July 27th, 1914, to 3½ now, an advance

of 25s., and the preference at 2½ are 1 1/16 up. Canadian Marconi at 10s. 9d. have practically doubled within the period, while the Americans at 17s. 6d. are 7s. to the good.

Underground Income Bonds at 80 show a fall of 7½ since July, 1914. Metropolitan Consolidated at 23½ is 13½ down, while Districts at 16 are 6 points lower. Central London deferred, now standing 60, compares with 81 on the outbreak of war.

Once again it is the London section in the electricity supply market that stands out with prominent strength on the week. City Ordinary at 12½ are 5s. up. County Ordinary are 10s. higher at 11½. South Metropolitan preference have jumped up 1s. 6d., and the ordinary are very firm at a guinea. St. James's rose 5s. on the dividend, and the remainder of the list keeps hard. Edison Swan partly paid changed hands at 15s. the other day. British Aluminium are a noteworthy feature of strength at 30s. Edmundson's non-cumulative preference are wanted at about 11s. 3d.

Callenders continue to advance, a rise of 10s. taking the price to 14½. In the iron and steel group, Babcock & Wilcox are better at £3.

The Gas Light & Coke Co. has reduced its dividend, and the stock has eased off to 71.

Brazilian varieties are duller on a sharp drop in exchange, and Brazil Traction shed ½ to 49½, the preferred falling a point to 90. Mexico Tramways bonds are a trifle easier, and British Columbia preference has lost 3 points. Argentines are mostly better, and the Tramways First preference sympathised with 1/16 advance. Canadian General Electric is 3 lower at 117½. Industrials as a whole are the least affected by the Russian news, and rubber shares steadily appreciate with the price of the produce, which has improved to 2s. 8d. per lb.

MANUFACTURE OF SYNTHETIC NITRATES BY ELECTRIC POWER.

At the meeting of the SOCIETY OF CHEMICAL INDUSTRY last week, Mr. E. KILBURN SCOTT read a paper on this subject. He said that when fixing atmospheric nitrogen in an electric furnace, the reaction mainly depended on the contact of air with the arc; many furnaces were faulty in this respect, and it was found that their defects were due to their being of the single-phase type; after showing that the Birkeland-Eyde, Schönherr, and Pauling furnaces were subject to this criticism, he described a three-phase furnace of his own design in which, he claimed, every particle of air must come into contact with the rapidly revolving sheet of flame. This was the only nitrogen furnace that had been developed as a self-contained three-phase unit.*

It was essential that the arcs should be blown into flames, either by a stationary magnetic field, as in the Birkeland-Eyde type, or a rotating magnetic field, as in the Mosciski furnace, or by the air flowing through the furnace, as in the Schönherr, Pauling, and Kilburn Scott types. It was a disadvantage to employ a magnetic field, as this involved the provision of a supply of direct current, whereas the air must pass through the furnace, and the arc flames produced by air flow were just as effective as those obtained by a magnetic field.

An advantage of the three-phase furnace was that it required only three electrodes, whereas three single-phase furnaces required six.

In single-phase furnaces the arc was started by bringing the electrodes together until the air gap was sufficiently short to allow the high-pressure current to jump across, a process involving risk to the plant; in his three-phase furnace the author avoided this drawback by using pilot sparks. A wire placed half-way between the tips of the electrodes was connected to a high-frequency apparatus, and when this was set in operation sparks passed from the wire to the electrodes, thus breaking down the air dielectric and allowing the arc to strike. The electrodes could, therefore, be set at the best distance apart, and a lower pressure could be used to operate the furnace, with a better power factor. He found it beneficial to keep the pilot sparks on all the time, as the yield was improved and continuity of working obtained, thus avoiding surges and other troublesome electrical phenomena. The flow of energy in a three-phase furnace was practically always at a maximum, and the arcs assisted in maintaining each other, whereas in a single-phase furnace the power varied from zero to a maximum twice in each cycle. Preheating the air economised heat, raised the temperature of the furnace, and dried the air, resulting in a larger yield. The higher the temperature the better, as it helped ionisation of the air; he had found it advantageous to use 250 deg. C. The preheat could be obtained from the gases leaving the furnace, and one large preheater could serve several furnaces.

The chemical action being reversible, it was important to chill the nitric oxide gas quickly. With single-phase furnaces, excess air was blown through for this purpose; in the Kilburn Scott type, a boiler was used to form the roof.

This method of cooling was effective owing to the latent heat of steam, and the steam could be used for generating electric power, or providing distilled water for the absorption plant. The boiler was connected to earth, and the blown arc flame acted on it in much the same way as any ordinary flame burning to carbon dioxide. The metal was not affected, because nitric oxide did not attack it. In Norway the furnace gases were passed through an ordinary Babcock-Wilcox boiler when the temperature had been lowered to about 200 deg. C., at which temperature nitrogen peroxide could do damage, and it was much safer in this respect to use the boiler directly on the furnace where the gas was still in the nitric oxide stage.

The yield obtained from single-phase furnaces was generally estimated at 50 to 60 gm. (1½ to 2 oz.) of pure nitric acid per kw.-hour, or, say, half a ton of pure acid per kw.-year. With the author's three-phase furnace yields 50 per cent. greater were quite feasible. Of the total energy put into the furnace, about 10 per cent. could be obtained as low-pressure steam. The yield rose to its full value in about a quarter of an hour from the time of starting the furnace. The pressure required to operate the furnace was under 1,500 volts, and power factors over 0.85 were obtained.

The usual absorption system consisted of a range of high towers of acid-proof brickwork, filled with quartz pebbles or some patented form of acid-proof filling. The gas entered each tower at the bottom and rose through the filling, whilst the absorbing liquid ran down over the filling in thin layers. Dilute nitric acid was collected at the bottom of each tower and forced up to the top of the next one, the liquor passing from tower to tower in one direction while the gas passed in the opposite direction; the acid concentration attained was about 25 per cent., which was high enough to make ammonium and calcium nitrate. Nitrous acid was formed during the absorption process, and split up in the presence of water vapour into nitric oxide and peroxide, the former then taking

up more oxygen from the excess air present; for this reason the gas should move slowly between the towers as well as inside them. Prof. Mosciski found that by making the supply of liquor to the towers intermittent the absorption could be very much improved. His absorption chambers were rectangular in plan, built together in one block, with perforated party walls; the chambers were alternately filled with quartz pebbles and empty, and the gas passed at about 4 cm. per second (1½ in./sec.) horizontally through the block, while the absorbing liquor intermittently ran down the acid-proof filling. With the Mosciski method 97 per cent. of the nitrogen peroxide gas was absorbed, and the nitric acid could be drawn off at a concentration of 40 to 50 per cent.

In the second part of his paper Mr. Scott compared in detail the direct method of making nitric acid with the indirect method (by the manufacture of calcium carbide and calcium cyanamide, and the oxidation of ammonia). He pointed out the many processes required for the latter system, the variety of machinery employed, and the necessity of facilities to supply limestone, coke, or anthracite, and carbon electrodes. On the other hand, the process of direct fixation of nitrogen was simple, the apparatus required a minimum, and the raw materials (air and water) universally available, so that the plant could be situated anywhere where suitable electrical energy was to be had. As regarded the cost of plant, the indirect process was not in the running with the direct, and the latter had a great advantage in respect of raw materials and labour, which would increase in the future.

Before the war electrical energy had been sold in this country at lower rates than at Niagara; in the future cheap power would be provided by large power stations, and some of 120,000 kw. each were already projected. Up-to-date coke ovens, with by-product recovery plant, would provide gas for power generation, and electricity would be largely used for electrochemical and metallurgical processes, one of the chief of which would be the manufacture of nitrates from air by the direct method. This lent itself particularly well to off-peak or off-season loads, as the furnaces could be switched on and off without detriment to themselves or to their products. The process could be established anywhere. In the case of coke-oven plant, the nitric acid could be combined with the ammonia derived from the gases to produce nitrate of ammonia, which was superior to sulphate of ammonia. The sale of such products depended on prices and analysis, and needed no goodwill or advertising; a new concern could sell all its output at once if it could supply a little below market price.

DISCUSSION.

Mr. BOWER said he was very much impressed by the discussion in the paper of the absorption process of Mosciski. This seemed a very good method, because in the absorption of these gases it was necessary to carry out a double function, viz., to oxidise and to absorb, and the Mosciski process seemed to take all the factors into account.

The PRESIDENT (Dr. CHARLES CARPENTER) said this matter had not altogether been neglected by the authorities, and a good deal of work was being done at the present time. The outstanding difficulty when entering on the erection of plants of this magnitude was to decide which process to adopt, viz., the one requiring the minimum amount of power or the process described by Mr. Scott, in which it was suggested that the power requirements were considerably larger, yet the other advantages were such that it might be found in the long run to be the best process to adopt.

Dr. E. FYLEMAN asked whether there was any possibility of electrolytic corrosion in the boiler. He understood that it was almost impossible under practical conditions completely to convert the nitric oxide obtained in this process into nitric and nitrous acids, and that a certain small percentage, which was given as from 3 to 5 per cent., of the total nitrogen which was combined to form the nitric oxide escaped into the atmosphere. If that were so, those wishing to work the process were not absolutely unrestricted as to the spot upon which a plant could be put down. The question of cost was important, and Mr. Scott had given absolutely no basis to go upon in attempting to compare this system with others. Could he give some approximate figures as to the cost of a plant for producing a certain quantity of nitric acid, and the amount of power, labour, and supervision required?

Mr. F. SPROXTON could not see why the yield of the new furnace was only 50 per cent. better than that of the old furnace. It appeared that the advantage should have been much greater. Was there any advantage in modifying the composition of the air by the admixture of oxygen to get nearer to the theoretical composition, say, four volumes of nitrogen to one of oxygen? Theoretically, there would be two volumes of nitrogen to one of oxygen.

Mr. J. B. WEBB said the Mosciski absorption process had been attracting a great deal of attention, and, as the author had pointed out, the important factor in the whole process was the oxidation of NO to NO₂. That seemed to depend on the actual time of traverse of the NO through the absorption towers, and in previous years the absorption was spoilt to a very large extent by the use of very fine packing, such as broken quartz. The packing in the towers must be of such a nature as to give both surface and free space, and he was at a loss to see how Prof. Mosciski's patent packing helped

*The Kilburn Scott furnace, in its original form, was described in the ELECTRICAL REVIEW of February 5th, 1915.

matters. Broken quartz packing gave approximately 40 per cent. free space, but he did not know why there need be two chambers. Why not have one chamber and pack it with, say, ring packing, which gave approximately 75 to 80 per cent. free space and, at the same time, a considerably greater surface than was obtained with broken quartz, unless the broken quartz was of the order of $\frac{1}{4}$ in. or less, in which case he would imagine the draught difficulties would be considerable?

Mr. E. W. MASON called attention to the fact that there was an American process, known as the Rankin process, which had been commented upon favourably by Prof. Norton. It consisted of a cylinder and piston with two small electrodes on it. The air was compressed and the arc started; then the arc was cut off and the gas allowed to expand, and it was claimed that good results were obtained.

Mr. SCOTT, in his reply, said that the fact that Mr. Bower appreciated the absorption system carried a great deal of weight with him, as Mr. Bower had made a considerable number of experiments. The President had mentioned that the Government were doing something at last, but it was three years late. The other day Dr. Addison had mentioned that something was going to be done with the fixation of atmospheric nitrogen. He had not thought of electrolytic corrosion in the boiler. He very carefully earthed the boiler, and alternating current did not give the same electrolytic corrosion as direct current. Nevertheless, it was known that corrosion with alternating current did take place under certain conditions, but he did not think there was much danger in this case. There was some escape into the air with the system used abroad, but he had it in his mind to make a complete cycle by taking the air and, after using it, adding oxygen to it, and not allowing it to go out into the air again. If oxygen were added to the air and then it were allowed to go out into the atmosphere again, it would be necessary to add so much that it would become too expensive. By working through a complete cycle it would only need make-up oxygen. He did not believe a great deal in patent packings. The Norwegians had pinned their faith to quartz. It was impossible, in all these fillings, to get rid of lime, and there was action on the lime; it was for this reason that quartz was better. The cost of a complete plant was, roughly, about £8 per kw. He had received a quotation, with guarantees behind it, from responsible people in Germany two years before the war to erect a complete nitric acid factory in this country for £6 10s. per kw. of plant, and probably £8 was a safe figure now. As to the Rankin process, he doubted some of the figures that had been given with regard to it.

THE MARCILLAC HAIL NET.

It is a curious fact that so many contradictory results have been reported by well-qualified investigators in the field of electroculture and in the electrical protection of districts against hail and lightning. However, evidence is now accumulating to show that electroculture is thoroughly practical and successful when applied in a suitable manner, and probably the same is true of lightning conductors as a protection against hail. We described recently* the use of "barrages" of "electric niagaras" in this connection, and it will be seen that M. P. Marcillac's apparatus and system, as described below, are a good deal simpler and less costly. A considerable amount of evidence is available to show that the present installation, near the summit of Chenavari, gives definite protection against injurious hailstorms, and, in any case, the

THE ELECTRIC NET AT CHENAVARI.

cost of the equipment is so moderate that it is worth testing carefully in other instances.

The "electric net" (*Gérier électrique*) illustrated in the accompanying figure, was erected four years ago at Roche-maure on the extinct volcano Chenavari (at the end of the Colson volcanic chain), at an altitude of 1,600 ft. (506 m.). The equipment consists of nine wooden poles fitted with metallic aigrettes connected between themselves by conductors. Eight of these poles are set on a terrace about 980 ft. (300 m.) long, 650 ft. (200 m.) wide, and 40 ft. (12 m.) high on the summit of the volcano, so as to mark out the apices

and centre of a polygon inscribed in a circle of about 295 ft. (90 m.) diameter and $\frac{1}{4}$ acres (0.6 ha.) in area. The ninth post is set below the terrace, as shown.

The aigrettes are built up from broad strips of iron terminating in points. The conductors connecting them consist of twisted cords of reinforced barbed wire; their length amounts to about 1,970 ft. (600 m.), and the number of points to about 12,000. Ribbons of iron are bolted and soldered to the base of each aigrette, and are carried down the poles and into buried "gutters" of perforated iron filled with moistened coke. The free end of each strip is fitted with a branching distributor (*perd-fuide*). In addition, strips provided with hooks ensure intimate contact between earth-ribbon, coke, iron gutter, and soil, the latter being reached through the perforations in the gutter. Ten earth connections of this type are established, and a supplementary connection is made to a small stream below the terrace.

It should be noted that no copper conductors are used in the Marcillac equipment, which thus differs materially from Beauchamp's "electric niagaras" (*loc. cit.*), these using very substantial conductors of high conductivity electrolytic copper. The distinction is an important one, both as regards capital cost and the risk of theft where a number of equipments are erected to protect an extensive area. There is no reason to suppose that the higher resistance of the Marcillac conductors entails any loss of protective value. On the contrary, high-frequency currents, such as lightning discharges, are conducted more readily by conductors of relatively high ohmic resistance but large surface, than by small conductors of low ohmic resistance. Marcillac secures maximum surface on the aigrettes by using flat strips instead of round rods.

The number of points on the net system is also held to be a factor contributing much to its efficacy. In addition to the aigrette points there are the barbs of the connecting conductors to the number of 12,000 or so. Perhaps the most remarkable feature of the Chenavari installation is that the earth connection has to be made in holes blasted in volcanic rock. There is no trace of the damp soil which one is accustomed to regard as essential to good earthing. One only of the earth connections is under favourable conditions, viz., the one in the small spring at the foot of the terrace. The rock does, however, contain 16 per cent. of iron (as oxide), a good deal being in the form of magnetic oxide. Doubtless this compensates to a great extent for the absence of moisture.

The successful working of the installation has been noted in a number of definite instances. The director of the Services Agricoles de l'Ardeche confirms the protective influence of the equipment, and since its erection, lightning troubles have been practically eliminated on transmission lines in the neighbourhood for several kilometres around. The Paris-Lyons-Mediterranean Railway Co. has decided to use the Marcillac system to protect certain sections of line which are to be electrified. Landowners in the neighbourhood of Chenavari assert that lightning and hailstorms are now very rare in the district, and such hail as falls is "mushy" and harmless in nature. It is true that a very heavy sleet storm was experienced last February, but as the protective equipment was then covered very thickly with rime, the incident rather supports than controverts the claim that the net is normally effective. The equipment is so cheap and simple that it should certainly be tested wherever lightning and hailstorms are prevalent.

UNDERGROUND SIGNALLING BELLS.

In an article under this heading which appeared in the *Iron and Coal Trades Review* of July 6th, the author, Mr. L. FOKES, discusses the design of bells in accordance with the report of Dr. Wheeler and Prof. Thornton, with a view to the removal of danger due to sparking at contacts. Mr. Fokes suggests that the best method of bringing old apparatus into line with the Home Office requirements—a method which can be followed with ease and certainty of success by colliery electricians—is that of rewinding the coils with parallel windings, one of which is short-circuited. This conclusion is open to question, for reasons given below. The author appears to have been led astray by an inaccurate conception of the mode of operation of the auxiliary coil in suppressing the spark. He says:—"In a circuit containing self-induction, such as the magnet coils of an electric bell or relay, it is found that any alteration in the current or the magnetic flux which is produced by it induces an electro-motive force in the coils which always opposes the alteration, whether it is by varying a current already passing through the coils, switching the current on, or cutting it off. The value of the induced electro-motive force depends on the rate of change of magnetic flux in the circuit, and a little consideration will show that the greatest rate of change of magnetic flux occurs at switching on and switching off the apparatus. In closing the circuit no ill effects disclose themselves, but when the circuit is broken the induced electro-motive force tends to keep the current flowing after the circuit is broken at the point of contact, resulting in a spark the heat of which depends largely upon the self-induction of the circuit, but also upon the amount of current flowing in the circuit when the contact is broken."

*ELECTRICAL REVIEW, p. 275, March 9th; p. 303, March 16th, 1917.

So far all is well; but unfortunately he goes on to say that "When a bell or relay is wound with a short-circuited parallel winding, any electro-motive force induced by the varying of the magnetic flux through the circuit, as when the circuit is broken, is neutralised by another magnetic flux *which is opposed to that of the bell coils*, and is supplied by the current induced in the short-circuited winding by the vanishing magnetic flux. This has the effect of rapidly wiping out the spark when the contact is broken, and greatly reducing its temperature."

The italics are ours. What really happens is not that an opposing magnetic flux is created, but that the *original* magnetic flux is maintained in direction, and allowed to die out slowly instead of being suddenly annihilated. Hence, in the absence of a rapid change of linkage of magnetic flux with the winding of the working coil, a high E.M.F. is not induced in the latter, and the spark is reduced to insignificant proportions.

This result is attained by the creation of a current in the short-circuited coil in the same direction as that in the working coil, which, roughly speaking, grows in magnitude at the same rate as the working current falls. The sudden injection of the extremely high resistance of the gap between the contacts into the circuit of the latter causes the current to die out very rapidly, and therefore what practically happens is that, in effect, the current is almost instantaneously transferred from the working coil to the short-circuited coil, and continues to flow in the latter after the main current has completely ceased to flow; it is damped out comparatively slowly by the resistance of the coil alone, and the magnetic flux dies with it.

As a simple analogy, suppose a billiard ball moving without spin to strike a similar ball at rest on a table, fair and square; the first ball stops dead, while the second is set in motion at practically the same speed and in the same direction as the first.

This is the object to be attained. The author remarks that "if the number of effective turns for operating a bell is the same as that of its short-circuited parallel winding, then the most effective spark-reducing element is obtained," and argues that the best course is to wind the bobbin with two wires at once, one winding being afterwards short-circuited; as an objection to winding the additional coil outside an existing winding, he remarks that "very often the amount of existing winding cannot easily be determined, and also, assuming both its resistance and number of turns are known, it is not an easy matter to decide how many turns of short-circuited winding are necessary to produce the desired effect." But this statement assumes that the number of turns on both coils should be about the same; this is an error. The number of turns on the short-circuited coil is immaterial; it is the *ampere-turns* that count. A single turn will suffice, if the resistance is low enough. Hence, a stout copper tube, preferably next to the iron core, is quite satisfactory, cheaper than wire, and much more reliable; it may even be put on outside the working coil, without disturbing the latter at all, but is less effective in that position, owing to magnetic leakage.

Messrs. Wheeler and Thornton in their report pointed out that a copper sleeve gave satisfactory results. They also approved of the use of a non-inductive resistance, connected across the terminals of the working coil, as suggested by Mr. H. R. Kempe; the resistance should be five or six times that of the coil. This method is perhaps the easiest of all to apply in a hurry, and is quite effective.

The rest of Mr. Fokes's article, dealing with the precautions to be taken in winding such coils, and the method which he has found convenient for testing bells for mine-signalling, is admirable.

ELECTRIC POWER GENERATION BY GAS.

THE recent discussion upon Mr. Robertson's paper before the I.M.E.A. indicated that electrical engineers were not carried away by the present prospects of coal carbonisation in conjunction with power generation on a large scale. It is true that the results of the Glasgow experiments, quoted at the I.M.E.A. meeting by Bailie Smith, sounded distinctly encouraging, but it is the fact that the advocates of low-temperature carbonisation systems, which are those involved in the proposition, have never had a very enthusiastic public even among chemists. That fact was again demonstrated last week at the meeting of the Society of Chemical Industry, as will be seen below.

In the course of a paper on "Industrial Fuel from Gas Works," on Thursday, Mr. E. W. Smith, of the Birmingham Gas Department, severely criticised the manner in which low-temperature carbonisation experiments had been carried out hitherto. There seemed, he said, to be no general agreement as to the object of the commercial development of low-temperature carbonisation. Those who had attempted to extend the process from the laboratory stage to practical working had varied in their aims. Some had hoped for high benzol yields; others anticipated high tar yields, whilst others had as their main object the production of a solid fuel which would burn easily in the domestic grate without producing smoke. Those who had been in closest touch

with many of the processes agreed that no really satisfactory results had yet been obtained. That did not mean that there was nothing in low-temperature carbonisation, but in his opinion, there had not been sufficient competent research work carried out to enable an opinion to be passed one way or the other. If one judged from the average published results, no more would be heard of the process. The recent paper by McLaurin, of Glasgow, was typical of what he meant. One of the proposals was that power stations could be put at the pit's mouth, and the gases used for generating electricity, whilst a domestic fuel would be produced. The chief advantage of that would be to centralise carbonisation and power generation, but it would decentralise domestic fuel supply. It had been overlooked that the coke produced would be very large, and that the question of freightage in distributing it to consumers would provide some difficulties. Again, if the question was examined on the basis of the figures which had, so far, been published, it would appear that the costs of washing for the light spirits for motor purposes, &c., were such as almost to neutralise the value of the increased volume of tar obtainable by low-temperature means. Taking all things into consideration, he thought there was need for the appointment of a strong Scientific Committee, versed in conditions of carbonisation, to go into the whole subject in an independent manner, in order to arrive at some definite conclusion, as far as was possible at the present time.

The PRESIDENT (Dr. Charles Carpenter), referring to the last suggestion, said it gave him some satisfaction to be able to say that the Fuel Board, which was a branch of the Research Department, had decided that the matter was so important, and that the opportunities for arriving at a definite conclusion were so unsatisfactory, that it was a matter of national importance that experiments should be made which were absolutely unimpeachable in accuracy. That was quite a broad-minded view to take, and negotiations were in a fairly forward state with regard to a site for the erection of the necessary works.

MR. DRUMMOND PATON, as one who had worked for years on the problem of low-temperature distillation, objected to the disparaging attitude taken towards the experiments upon low-temperature carbonisation by the author. Only by means of this could the millions of tons of waste coal now produced be used. The difficulty of transport of the resultant coke could be got over by briquetting, as in that form the coke could be much more expeditiously handled.

MR. SMITH, in reply, said he had no intention of casting any reflection upon the *bona fides* of the experimenters with low-temperature carbonisation. What he deprecated was that this work was the only work that had been done. It should have been carried out by men who probably had less experience in coal and more experience in research, in conjunction with the other workers.

PATENT LAW.

AT the annual meeting of the SOCIETY OF CHEMICAL INDUSTRY, in Birmingham, on Thursday, last week, DR. REE read a short paper dealing with the position of patents under present legislation. After pointing out that the compulsory working clauses of the Patent Act of 1907 were directly traceable to the efforts of the Manchester Chamber of Commerce, he drew attention to the manner in which these had been rendered very largely nugatory through the judgment of Lord Parker some 15 months later in the Hatchett case. That judgment was based largely on the argument that it was unreasonable to call on a defendant to prove or disprove the plaintiff's case, and that to do so was contrary to the principles of English justice. This reduced the compulsory working clauses to an absurdity, because it was obvious that all the patentee had to do was to refuse any information as to adequate manufacture here. The plaintiff might produce witness after witness to show that he was unaware of any manufacture in this country, but that would be no proof of non-working. As a fact, the principle of calling upon a defendant to prove or disprove what the plaintiff alleged was not contrary to the rules of English justice, and many examples could be cited in which this practice was followed. There was, for instance, the case of the trader who applied to the Railway and Canal Commissioners for a lower railway rate; the railway company was then called upon to show that the rate was a reasonable one. A receiver of stolen goods had to account for possession of the goods, and a publican had to show justification for serving a man who was drunk. In his opinion an applicant for revocation of a patent should have the same right of discovery as the applicant in a Chancery case, viz., by interrogatories.

He would like to revert to the position under the Statute of Monopolies in order to prevent Germans taking out patents in this country, preventing manufacture here, and working them abroad, thus creating a protected market in this country for the goods at our expense, fostering the foreign industry and damaging ours. It should not be enough that *part* of the invention should be worked here. The importance of insisting upon this would be apparent to all who had knowledge of what happened at the outbreak of war, when one of the difficulties was not the production of certain products, but the impossibility of obtaining certain intermediate substances. If this principle had been insisted upon years ago in regard to chemical patents, we should to-day have had an organic chemical industry rivalling that of Germany. He disputed the argument that this was primarily a matter of education; if the

Chambers of Commerce had got what they asked for years ago, there would have been plenty of suitably trained English chemists to carry on.

Either we must revert to the interpretation put upon the compulsory working clauses before Lord Parker's judgment, or to the position as it was before 1907. Compulsory licences were useless, as the patentee would always be years ahead of the licensee, to whom he would not give the latest information, because it was well known that very few patents were worked strictly in accordance with the final specification. The Germans had been fully aware of the benefits to them of the old patent law, and therefore they were the most embittered opponents of any attempts to alter it. For years and years every device was used to prevent any amendment; indeed, it was urged that if any attempt were made to do so it would lead to retaliation. At that time they had clauses in the German patent law far more stringent than those proposed in ours, and nothing happened.

MR. A. G. BLOXHAM submitted that the author was wrong in what he said with regard to retaliation on the part of the Germans, because within a very short time of the passing of the 1907 Act both Germany and Austria altered their laws, and put them on precisely the same basis as the clauses in the 1907 Act—i.e., German patents in the hands of foreigners were to be revoked if the patentees worked the inventions mainly abroad.

DR. REE replied that the clauses of the German Patent Acts with regard to compulsory working were more stringent than ours, and when they were brought into line with our compulsory working clauses in the 1907 Act it really made things easier for us.

MR. J. W. HINCHLEY thought the chemical industry had reached a point at which there was an entire breakdown of the patent system. To patent a process was only to tell everyone what the patentee was doing, and from that point of view a patentee required more protection from the State without so much expense. Many inventions were made which were not patented, simply because the man who worked out the process, or whatever it was, would not be protecting himself at all. He would simply be giving away what he had done. Therefore, it seemed to him that before long we must have some system of State protection quite different from our present patent law. There had been instances recently in which inventions had changed hands for quite considerable sums of money without their having been patented.

NEW PATENTS APPLIED FOR, 1917.

1917.

52. APPARATUS FOR RECORDING CO-RELATED LIGHT AND SOUND VARIATIONS. W. B. VANSIZE. Jan. 7th, 1917. (107,167.)

Irish Peat Deposits.—The Fuel Research Board, with the sanction of the Committee of the Privy Council for Scientific and Industrial Research, has appointed a Committee of Inquiry into the utilisation of Irish peat deposits. The terms of reference to the Committee are as follows:—

"To inquire into and to consider the experience already gained in Ireland in respect of the winning, preparation, and use of peat for fuel and for other purposes, and to suggest what means shall be taken to ascertain the conditions under which, in the most favourably situated localities, it can be profitably won, prepared, and used, having regard to the economic conditions of Ireland; and to report to the Fuel Research Board."

Though the inquiries of the Committee will ultimately lead up to the consideration of peat as a source of energy in central power stations, there are sound reasons why this aspect of the problem should be postponed to a later stage. On the one hand, the Fuel Research Board is already organising an extensive inquiry into the problems of fuel economy in connection with power production, and the results of this inquiry will supply the fundamental data and information which will be required when the time comes for the consideration of any wide scheme of development in Ireland. On the other hand, any schemes of development must be based on a more exact knowledge than is at present available regarding the selection of the more favourably situated bogs and the possibilities of winning and transporting partially dried peat to centres at which it may be converted into marketable products. It is obvious, therefore, that the inquiries of the Committee are likely to be most fruitful if they are concentrated on the fundamental problems, for until these are settled no satisfactory progress can be made.

The following appointments have been made to the Committee:—Sir John Purser Griffith (chairman); Prof. Hugh Ryan, Prof. Sydney Young, Mr. George Fletcher, Prof. Pierce Purcell (secretary).

All communications should be addressed to the Secretary, the Peat Inquiry Committee, University College, Dublin.

"FROM WHATEVER SOURCE AVAILABLE."

THE British Vice-Consul at Baku has reported upon the large demand there is, and will be, for internal-combustion engines of from 2½ H.P. to 100 H.P., for the oilfields. There is also an increasing demand for engines of the Diesel type for driving electrical power plant. Electrical power is being used on the oilfields more and more each year, both for drilling and for baling the wells, while the whole of the fields are lighted electrically. Electrically-driven pumps, lathes, and fittings for machine shops (not so heavy as the usual British types), and all sorts of other requirements are alluded to by Mr. McDonell. It is recognised both by him and by the Board of Trade, which gives publicity to the matter in its *Journal*, that on account of the difficulties of communication, and restrictions on exports during the war, there is little possibility of anything being done at present *except preparatory work*. "He, however, lays emphatic stress on the importance of such preparation, pointing out that as soon as communications re-open supplies *will have to be obtained at once from whatever source available*." We believe that industrial and trade students who try to avoid taking a narrow view of the outlook see that when fighting ceases, the whole of the nations, whether they have been at war or not, will be scrambling to secure their requirements for replacement and renewal work in industrial operations. We discussed this matter somewhat fully in a leader on "The Demand that will Follow" (ELEC. REV., February 25th, 1916). We then said, referring to the needs of Russia and other purchasers: "Will the character of British products be adjusted to meet their requirements? Will British manufacturing capacity be increased to any large extent? . . . The answer is emphatically in the affirmative, but will the capacity be sufficient to justify other nations in basing international trading policy upon possibilities in this direction? . . . We may be as anti-German in sentiment as the horrors of this war compel us to be, but the fact remains that, if in any country whatsoever other nations cannot suitably meet the requirements of purchasers, the trade will have to go to those who are in a position to do it, and who are not merely in that position from a manufacturing capacity point of view, but are eager to employ every possible means of adaptation and enterprise within their power, to attain that end." It is 18 months since we wrote thus. In that period, engineering manufacturing capacity of all kinds in these islands has greatly increased, but the difficulties in the way of export trade developments, whether for the Russian market or any other, have also increased, and the influences that will eventually control purchasers who experience an imperative demand for goods appear to be the same. German manufacturing facilities, so far as we are able to tell, appear to be pretty much what they were before the war, and immense efforts are being made to secure a renewal of trading relations with former markets.

We have done wonders in this country in many new and extended manufacturing operations, yet Mr. Hirst, at the meeting of the General Electric Co., Ltd., pointed out that the existing British electrical companies had

yet to make good a deficiency in output to cover the demand which in pre-war time was supplied by importation. It is clear, then, if our deficiency represented by the amount of our importation is not yet being made up, we have not yet prepared for the extra demand that will follow from the outside markets which will immediately call for electrical and engineering manufactures "from whatever source available." Mr. Hirst says that the re-organisation work awaiting our electrical companies after the war will be a tremendous task. A number of schemes for re-organisation, re-arrangement, co-operative working, and so forth, have been proposed, and some of them are taking practical and financial shape, but it is clear that much more requires to be done if we are to be strong and big enough electrically to do all the things that we aspire to do. We believe with many of our industrial leaders and engineers that the future for British electrical industry is wonderfully bright. Mr. Hirst summarised some of the facts and possibilities of the situation admirably. We hear of other proposals which will assist to make us stronger than we have been or are, and the opportunities that will present themselves will call for a vast amount of new capital to be brought to the aid of electrical manufacturing. The pity of it is that, knowing all of these things well as our leaders do, they find it necessary to tie our hands in many ways, either directly or indirectly, in consequence of war activities or restrictions, or of financial burdens, so that we cannot do things that we desire to do. It is as plain as anything well can be that necessity will dictate many courses of action that present sentiments may not approve because, as Mr. McDonell says, supplies "will have to be obtained at once from whatever source available." He may well lay "emphatic stress" upon the importance of preparatory work. Unfortunately, such preparatory operations are extremely difficult to proceed with amid the prevailing conditions. The directors of the General Electric Co., Ltd., in their report, stated that these conditions "had not enabled them to proceed with the preparations for the developments awaiting the electrical industry after the war." Other manufacturing concerns have been in a similar position, though some have indicated measures that they have been able to adopt. The fact is that the possibilities are so vast that the situation calls for operations of a far-reaching kind, or else we shall only reap a small fraction of the advantage that lies within our grasp, and that might be ours if we only had the kind and size of organisation that seems to be necessary.

H.M. Consul at Ekaterinburg has been reporting lately on the situation in the Urals. At first there was an outcry for British goods, and Russian merchants failed to understand the great difficulties that stood in our way in meeting their demand. They "seemed to think that British goods ought immediately to fill up the gaps left by the absence of German goods," but they were eventually forced to obtain supplies from Japan and the U.S.A. The result was that imports into the Urals from Japan, the U.S.A., and the United Kingdom stood in the proportion of 10, 5, and 2. Urals merchants have been glad to obtain even low-grade goods which they could sell on the empty markets at fabulous prices. For this reason, he adds, "it is difficult to form an idea at present of how the United Kingdom, the United States, Japan, and Sweden will fare in the competition for trade that must arise after the war." The United Kingdom difficulty is the greater, in his opinion, because British representatives have not been able to visit the country during the war to make a study of local conditions, without a knowledge of which successful trade with Russia is impossible. This is one of the measures of preparation that the electrical industry has been trying to

make in a moderate way through existing organisations in spite of the unprecedented difficulties. Mr. Garvin has said lately that if the war were to end now it would be disastrous for us, because we are unprepared for what is to follow. The Government says that it appreciates the possibilities, and recognises that the difficulties that it is bound to put in the way of traders are a handicap, but it must have revenue. The longer the war lasts the more revenue it must have, and some of our measures by way of preparation may be still longer deferred. It is devoutly to be hoped that the nation, especially Labour, will grasp what some of these things mean and what they call for. Whatever the special features of the war settlement may be, the manufacturing character of the German people will remain. Then Russia, the near neighbour, free and democratised, but comparatively short of industrial manufacturing facilities of her own, will, as Mr. McDonell has said, and as M. Gurievitch also indicated in his article which was translated in the ELECTRICAL REVIEW for February 25th, 1916, secure "from whatever source available" those things of which she is in need. She will not impose restrictions purely on the ground of sentiment if they are opposed to her own immediate industrial and economic interests. The sooner that we and the Allied countries, including now the U.S.A., can get ahead with that preparatory work the better will be our chances for being that "available source."

The Role of the Engineer.

FROM time to time the engineer, usually absorbed in his professional work, wakes up, looks round, and realises that there is another world besides that in which he habitually moves—the world, that is, of the "man in the street." With the organisation, administration, purposes, and triumphs of the engineering world he is familiar; in all these phases he plays a part, humble or distinguished as the case may be. But of the other world, the everyday world of the social organism, he reckons little; its construction and operation are not subject to calculation and measurement, its motives are obscure or obviously fallacious, its components heterogeneous and disorderly—in fine, it is not congenial to his trained and ordered habit of mind, he is perhaps not a little inclined to despise it and its ways, and certainly he feels no over-mastering impulse to take part in its affairs.

But is he right in this? Modern civilisation is built up on an engineering foundation. In every department of life the influence of the engineer inevitably makes itself felt, though unrecognised by the vast majority. For lighting, heating, cooking, transportation, both of persons and commodities, water supply, sanitation, housing, agriculture, fishing, fighting ("this is an engineers' war")—the engineer is ultimately responsible, often jointly with his highly esteemed colleague, the chemist, who himself is often half an engineer. The functions of the engineer *quâ* engineer, therefore, are intimately bound up with human affairs; why should he rigidly confine his activities to professional paths? Is he not admirably fitted, by education, training, and intellectual ability, to take an effective part in the management of public business? Yet we very rarely find an engineer as a member of a municipal council, of Parliament, or of other public administrative bodies, which are consequently deprived not merely of the technical knowledge so essential to the conduct of public affairs, but also of the sober judgment and logical reasoning which the successful engineer must necessarily display in his profes-

sional work. This is not by any means the first time that we have touched upon this subject, nor will it be the last. We will not now pursue it further, but we recommend the perusal of the remarks of the President of the American Institute of Electrical Engineers, of which we give an abstract elsewhere in this issue, which admirably state the case for the participation of the engineer in the affairs of the nation, and show that it is not merely his right, but his solemn duty to bear his share of responsibility.

In the course of his address Mr. Buck referred to the formation of the Engineering Council of Civil, Mechanical, Mining, and Electrical Societies, representing some 30,000 engineers, who are thus organised for co-operation in all matters affecting their interests and for the creation of "an engineering public opinion." The importance of this movement can hardly be over-emphasised. The Engineering Council of our American Allies meditates no harm to ourselves, but it must not be forgotten that an equally powerful and, from our point of view, formidable Association has been formed in Germany; we gave particulars of the latter in our issue of May 11th, 1917 (p. 519), which show that the "Union of German Technical Institutions" embraces no fewer than 11 leading societies of engineers and chemists. Have our leaders given due attention to this important movement and to the influence which it may, and probably will, exert upon the course of events when Peace returns? To ignore its existence would be folly—but what are we doing to prepare our defence? Surely we cannot do better than follow the dual example thus placed before us, and lose no time in organising, not only the manufacturing industries of the country, but also the magnificent and unrivalled fund of engineering knowledge and experience at our command. Apart altogether from questions of warfare, military or industrial, the combination of our engineering forces is an object well worth attaining for many other weighty reasons.

In our issue of December 29th, 1916, we referred at some length to the recommendations that had been made by the Federation of British Industries respecting the proposed reform of the consular and commercial intelligence services. It would be interesting to know whether the Government has so far completed its own review of these and other recommendations as to be able to form definite conclusions regarding the measures which ought to be taken for ensuring the co-ordination and efficient operation of such services in the interests of British trade and industry. It has frequently been stated by those best fitted to form a practical opinion on the matter that it is most important that whatever improvements are introduced should be available, if at all possible, before the end of the war. The unwillingness of the Government to announce its policy occasions disappointment and no little disquiet in commercial and industrial minds. All our armour will need to be in fit condition for trade after the war in order that our colonial and international trade may be revived, maintained, and extended. The prospective labour situation on demobilisation will call for abundance of work and good wages for many years, and the financial burdens of the war cannot be carried unless we strengthen our industrial position, and if this Government or any other leaves measures unprepared which might go toward ensuring that state of affairs it will have much to answer for. We hope, therefore, that our leaders will soon feel able to announce that they are doing something along the indicated lines, that that something includes concentrated, in place of scattered, control at home, and an army of efficient industrial

and commercial men located throughout the world as representatives of a strong Government Department. The war has placed heavy financial burdens upon our manufacturing concerns, and in a large measure their normal trade connections are suspended. It is surely due to them that their recommendations concerning things that the State might reasonably do to help them to recover their lost position should be heeded and, if possible, acted upon promptly—not dallied with. At least the reasons, if any, for their non-acceptance could be officially divulged.

ELECTRICITY SUPPLY IN PARIS.

As is tolerably well known, our French Allies are making strenuous and successful efforts in the direction of developing the large resources in water power which still remain unutilised in that country. This attitude is due largely to the necessities created by the war, particularly in view of the comparative scarcity of supplies of coal. Under existing circumstances, the hydro-electric works have been placed at an advantage as compared with the steam generating stations, which have suffered greatly from the shortage and dearness of coal as well as of other materials. A typical instance of the latter class is represented by the *Compagnie Parisienne de Distribution Electrique*, which practically has a monopoly of the supply in the French capital.

The report of the directors of this important company states that the continuation of the war rendered the distribution of electricity in Paris more difficult and more costly in 1916 than in the preceding year. As the demand for motive power on the part of the war industries experienced a considerable increase, the company endeavoured to meet it, as far as possible, in the interests of the national defence, the result being that the total turnover for lighting and power purposes exceeded 127,000,000 kw.-hours in 1916, as compared with 69,070,000 kw.-hours in the previous 12 months. On the other hand, the greatest troubles, among obstacles of every kind, were encountered in procuring coal for the company's two works: frequently only inferior coal was available, which was subject to enormous increases in prices, whilst, at the same time, there was always present the apprehension of a complete exhaustion of the stocks. How serious this matter became on one occasion is shown by the fact that with a daily consumption of 760 tons of coal, the quantity of the stocks distributed between the two generating stations at the end of 1916 did not reach 6,000 tons, or the equivalent of less than eight days' working. The labour question, too, proved to be one of great difficulty owing to the necessity for recruiting, as substitutes for skilled workers who had been called to the colours, a fresh staff of helpers who had to be selected from casual workers and men of foreign nationality, who were so incompetent that no fewer than 3,500 had to be engaged in order to maintain a regular effective of from 400 to 450 auxiliary workers.

The obligations assumed by the company under the concession were to supply and distribute electrical energy in Paris at maximum prices, which were not to vary between January 1st, 1914, and June 30th, 1940, to pay to the Municipal Council a rental in proportion to the gross receipts, and to redeem at the company's expense during the concession the costs of first establishment, which were nearly £8,000,000, and which were to be increased annually by an average expenditure of £68,000 for supplementary works.

Before the concession was accepted, the constituent elements of the cost price formed the subject of a minute analysis by representatives of the company and of the Municipal Council, and the only divergence of opinion related to the question whether the expenses for coal should be estimated at 16s. per ton or 19s. 2d. per ton. But if the fundamental suppositions which determined the agreement eventually arrived at were realised in times of peace down to the end of 1913 the case became quite different almost from the time the present company became the concessionaire. In fact, the war radically modified the situation.

As an illustration of this contention, it is mentioned that

the consumption of energy for private lighting, which exceeded 80,000,000 kw.-hours in 1913, declined to less than 51,000,000 kw.-hours in 1915 and to less than 45,000,000 kw.-hours in 1916, when the undertaking was hampered by administrative restrictions in the second half, whilst the public lighting has also been diminished by more than half the former amount. On the other hand, an augmentation has occurred in the use for power purposes, the growth having been from 10,000,000 kw.-hours in 1913 to nearly 82,000,000 kw.-hours in 1916. During this period the price of coal has gradually risen until it reached an average of £3 per ton in 1916, which has increased threefold the expenses which were provided for under this heading in the concession, without taking into consideration the advance in the other constituents which also share in forming the cost price. It is known that the situation will become graver in the present year, as the recent purchases of coal have only been possible at £4 12s. per ton, and the supply of energy for the national defence consequently threatens simply to result in a loss to the company if the present system is maintained. Under these circumstances of a complete reversal of the provisions made under the concession, the company thought it would be sufficient to appeal to equity in order to obtain compensation from the Municipal Council in some form or other, and without having to take advantage of the principles of law, recently issued by the Council of State, and accepted by a number of French Municipal Councils. A peremptory refusal, however, has been the only result, as the City of Paris, notwithstanding the reversal of all the conditions upon which the agreement was based, claims to be exempt from the consequences of it, and to preserve the right to receive the whole of a progressive rental which proceeds from 10 to 25 per cent. of the company's gross receipts. The directors have therefore felt constrained to institute an action to enforce their rights, and they have full confidence that their application will be successful.

It would appear that, under the circumstances of the present times, all the holders of concessions from the City of Paris have points of dispute with the Municipal Council, the Metropolitan Railway Co., and the Nord-Sud Railway Co. also having differences with this authority. Indeed, as the chairman of one of these companies recently remarked, the City of Paris desires all the advantages without, at the same time, participating in the risks—a point which will, doubtless, be borne carefully in mind in the case of any future concessions in the French capital which may be dependent upon the goodwill of the Municipal Council.

THE GARRETT PATENT ELECTRIC WAGON.

For some time past it has been known that Messrs. Richard Garrett & Sons, of Leiston, were embarking on the manufacture of electric vehicles, and it is with considerable pleasure that we describe and illustrate herewith the first commercial electric wagon turned out by their works, and supplied to the Great Eastern Railway Co.

This wagon has 3½ tons capacity, and is capable of travelling from 35 to 40 miles upon one charge of the battery, the average speed being eight to nine miles per hour.

We understand that the firm also have designs completed for a vehicle of the same description, but with a carrying capacity of 2 to 2½ tons, and a speed of 10 to 11 miles per hour, the mileage on one charge being 35 to 40 miles, as in the larger design.

The wagon illustrated enjoys the distinction of having been both designed and built in an English works, and is therefore somewhat unique. Messrs. Garrett are past-masters in

the art of steam wagon building, and their experience has been turned to good account in this vehicle, in which both weight and friction have been reduced as far as practicable.

The well-known "Ironclad Exide" battery is employed, but the makers are quite prepared to fit any other battery that their customers may fancy; the battery is carried slung below the chassis frame, and is arranged in trays of a convenient size for handling, which can be withdrawn from either side of the vehicle with equal ease.

The chassis is arranged so that any type of body may be fitted, but the standard arrangement is a wooden platform

GARRETT ELECTRIC VEHICLE SUPPLIED TO THE GREAT EASTERN RAILWAY.

supplied with either chock rails, fixed or hinged sides, and tailboard.

A single series-wound 8-H.P. motor is used, having an overload capacity of 300 per cent. for short periods, with transmission by an enclosed silent chain, running in an oil bath, to a countershaft containing the differential gear, and thence to the rear wheels by means of silent roller bearings.

The countershaft is suspended from the chassis in ball and socket joints to obviate any chance of undue friction brought about by possible wringing of the frame when travelling upon very uneven roads. Both axles are of specially treated steel of a kind which Messrs. Garrett have proved by their extensive experience in steam wagon practice to be best suited to withstand road shocks, and the wheels fitted to them are of a minimum weight consistent with adequate strength; furthermore, they are all fitted with Timken roller bearings.

Two independent brakes are fitted, both of which act directly upon the hind wheels. The foot brake, for general use, is of the contracting band type, while the emergency hand brake is of the expanding type. Messrs. Garrett have adopted this system because the general practice of fitting the emergency brake to the countershaft has the defect that, if the chains to the rear wheels snap, the emergency brake is useless.

The arrangement of the speed controller has several unique features. It is of the drum type, rotated by a handle attached to the steering handwheel, and gives six speeds in a forward direction, and four in the reverse. The controller is fitted with Messrs. Garrett's patent trip gear, which is so designed that so soon as either foot or hand brake are applied, the controller, which is carefully balanced, flies back to the neutral position automatically, and is so arranged that it is impossible to start the vehicle without first returning the controller handle to the neutral position and also releasing the brakes. This arrangement prevents damage being done by a heavy rush of current through the battery or motor, owing to the driver omitting to bring the controller handle to neutral before applying the brakes, as the act of applying them does this for him; also, if his brakes are applied, he is bound to release them before he can start to run. Furthermore, it obviates the risk of accidents which have occurred through a vehicle starting forward the moment the brakes are released when the controller has not been in the neutral notch.

Great attention has been paid to the lubrication of the working parts, and lubricators have been fitted at every point where, by doing so, friction can be reduced, and roller or ball bearings have been fitted throughout.

This has resulted in a vehicle that requires only a fraction above a quarter of a horse-power to drive the complete mechanism at average road speeds.

Some data as to the working of this vehicle, recently quoted in the *Commercial Motor*, covers 22 working days, during

which 307 tons were carried on 100 journeys; 965 deliveries of goods were made, over a working time of 215 hours. The all-in cost per ton carried was 1s. 11d., while the cost of horse transport on a similar basis would have been nearly 2s. 9d. per ton.

We are indebted to Messrs. Richard Garrett & Sons for particulars of their vehicle.

EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING MAY AND JUNE, 1917.

THE official returns of electrical exports and imports for the months of May and June, show, as regards the exports, totals of £346,317 and £367,520 respectively, which compare with £308,511 in April and £404,586 in March, and are quite up to the average. The imports totals for the same months have been:—March, £286,921; April, £235,985; May, £236,799; and June, £186,888, showing a falling off in value. During the last three months machinery export values have steadily improved, while machinery import values have pursued the opposite course; in addition, the importation of glow lamps has dwindled to very small proportions, though an increasing business is being done in imported "arc lamp parts."

The exports for May and June included submarine telegraph and telephone cable to the value of £3,322 and £14,210 respectively; some £2,000 worth only of telegraph cable entered this country from abroad during the above months.

It is unfortunate that the official export figures for the above months contain unenumerated material (electrical goods and apparatus and machinery), representing over 25 per cent. of the total export values given, and one wonders what the effect on values the proper classification of these "unenumerated" species would have.

EXPORTS AND IMPORTS OF ELECTRICAL GOODS AND MACHINERY, MAY AND JUNE, 1917.

	Exports (May).	Imports (June).	Exports (June).	Imports (June).
Electrical goods and apparatus unenumerated ...	£ 62,717	£ 47,244	£ 53,580	£ 35,727
Insulated wire and cable (not telegraphic or telephonic) ...	35,121	2,826	56,404	2,304
Electric glowlamps ...	12,073	444	9,999	1,773
Arc lamps and parts (not carbons) ...	1,442	10,071	14,035	15,967
Meters and instruments ...	4,972	3,749	14,419	3,511
Electrical machinery (including switchboards and transformers) ...	122,270	137,025	134,096	102,663
Batteries ...	13,237	18,256	10,486	17,009
Carbons ...	5,964	11,984	241	5,108
Telegraph and telephone wire and apparatus ...	88,521	5,200	74,260	2,826
Total ...	346,317	236,799	367,520	186,888

AIR-BLAST RECTIFICATION OF HIGH-TENSION CURRENTS.

THAT a partial rectification of a high-tension alternating current occurs on the passage of a discharge from a point to a plate has been known for many years. However, difficulty has been encountered in attempting to utilise this rectification, particularly if any considerable current flows, as a heavy arc then results which rectifies but little.

In the June, 1917, issue of the *Physical Review*, E. R. Wolcott and C. J. Erickson relate the results of an investigation into the effect of a blast of air on this discharge. It was found that complete rectification and smooth operation could be obtained by means of a current of air flowing from the point to the plate under such conditions.

When rectification occurred the discharge was white, rhythmic and snappy, as distinguished from the coloured arc which resulted when no air was flowing. Difficulties were encountered when trying to operate at too low voltages, say, only a few thousand volts, since a certain voltage is required to jump the air gap. Likewise, there is a drop in voltage across the rectifier in actual operation. Satisfactory rectification has been obtained up to 350 kv., and also at frequencies up to 500 cycles per second.

With the point inside a glass tube the discharge is more snappy, but the tendency to surge is greater. In this case aluminium electrodes seemed preferable, a larger plate was necessary, and a greater air pressure was required. With the point outside the tube, satisfactory results were obtained with iron and brass electrodes.

As the air pressure increases from zero during the discharge, the rectification increases to a maximum, the value depending upon the setting of the electrodes and the diameter of the air outlet. A

further increase of air pressure beyond the value which gives maximum rectification produces irregular operation.

In general, the wave of the rectified current follows the wave form of the generator, but as a certain voltage is required to start the discharge, it does not include the whole half wave produced by the alternator. Furthermore, the rectified wave is more abrupt than the original wave.

The experiments were conducted with the apparatus illustrated in fig. 1. A pointed metallic electrode *a* is mounted co-axially

FIG. 1.—ARRANGEMENT OF TEST EQUIPMENT.

within the tube *B*, which is restricted at one end, so that air entering at *A* is blown through the opening *o* toward the plate *P*. Rectification occurs when the point is some distance within the tube, at the opening of the tube, or extending some distance outside of the tube, as shown. In the first two cases, the tube *B* must be made of some insulating material, as of glass; in the last case, it may be of metal.

Mounted for use, this rectifier was connected to one terminal of the secondary of a 2-kw., 40,000-volt transformer *T*, the other terminal being grounded. The positive current flows from the point to the plate, and no discharge results in the opposite direction when the distance between the point and plate, that between the point and air outlet, the air pressure and the voltage are suitably adjusted.

Connected between the other terminal of the transformer and the ground were three milliammeters: *M*₁ was of the electro-dynamometer type; *M*₂ was a direct-current instrument of the D'Arsonval permanent field type; *M*₃ was a hot-wire instrument.

The secondary voltage from the plate *P* to ground was measured by an electrostatic voltmeter. An oscillograph was connected directly in the high-tension circuit between the water resistance *R* and the ground.

The air condenser *C* consisted of 11 plates 8 ft. by 3 ft. (2'44 m. × 0'91 m.) and 8 in. (20'3 cm.) apart. Its capacity was

FIG. 2.—RECTIFIED CURRENT OBTAINED WITH AIR-BLAST RECTIFIER AND LOAD OF 104 MILLIAMPERES.

0'00095 mfd., and it was connected in parallel with the water resistance when desired.

The diameter of the plate *P* should be large enough to prevent a discharge from the point to its edges. In the arrangement here described its diameter was 4 in. (10'16 cm.). The diameter of hole *o* in the tube *B* was 0'157 in. (4 mm.); *d*, the diameter of the metallic electrode *E*, was 0'0625 in. (1'57 mm.); *L*, the distance between the opening *o* and the point of the electrode *E*, was 0'375 in. (9'54 cm.); *D*, the distance between the plate and the point, was 0'68 in. (1'76 cm.). The frequency of the alternating current was 60 cycles per second.—*Electrical World*.

Mexican Electrical Taxes.—H.M. Chargé des Affaires at Mexico City reports that Decrees were issued, under date June 5th, by the President of Mexico, imposing special stamp taxes on electric lights and telephones. The tax on electric lights has been fixed at 10 cents (Mexican gold) per month for each light up to 40 watts, and 10 cents extra for each light in excess of that power. Telephones in private houses are to be taxed at 50 cents, and in shops, offices, &c., at \$1 (Mexican gold) per month. These taxes are to be collected through the companies supplying the services.—*Board of Trade Journal*.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Electroculture.

I am glad to see that your recent report of the Board of Agriculture experiments and my article on electroculture have aroused so much interest in a new and, I believe, very important use of electricity. Particularly I wish to thank Mr. Turnbull for his favourable comment on my effort.

A correspondent asked whether the Armstrong hydro-electric machine would not be a useful generator for this purpose. I think this is doubtful; it is true that books of the "Ganot's Physics" type describe this as a very powerful machine developing large quantities of electricity, but it must be remembered that in those days "a large quantity of electricity" was what one got on putting the knuckle near the discharger of a pint Leyden jar. Such a machine is spoken of as giving "a torrent of sparks"; this does not describe the roaring patch of violet light seen between the dischargers of a W.T. set, even when only one or two milliamperes are being supplied to the condenser. The machine does give great potential, but I believe the quantity is doubtful and erratic. The action depends on the steam getting condensed at the right moment, and the nozzles wear under the impact of the particles of water.

Perhaps the most important point against it is the starting-up trouble. The charge is wanted on the wires for a short time once every 12 hours, and therefore the machine would have to be warmed up every time, or else stand-by losses incurred for about 20 hours out of 24. This would put coal and coke firing utterly out of court, and even a paraffin-fired flash boiler has to take up a large quantity of heat into the mass of metal, brick and water before it can begin to give off steam at from 80 to 100 lb. per sq. in. Then it has to deliver only 4 to 5 B.T.H.U., and is shut down for another 10 hours, when it all begins over again!

Mr. Turnbull speaks of static machines, but I think he will find the efficiency low. Makers are very shy about speaking of the output of their machines as regards current—they are emphatic as to their spark length and many excellencies, but under pressure generally admit that the current is "very hard to measure," i.e., is too small for a cheap moving-coil pivoted instrument. Certainly a machine that gives 1 milliampere at a 6-in. spark length—i.e., 100 watts—is a big machine, and takes fully 1 H.P. to drive it.

The limit to the potential given by a static machine is the rate at which the induced charge leaks away over the surface of the plate; this increases rapidly with the potential, and finally equals the rate of increment, when no further rise in potential can take place.

This leakage and the friction, not only due to bearings, but largely windage, make the efficiency very low.

Their fragile construction and sensitiveness to damp are also severe handicaps in practical use.

Perhaps the most telling argument against both types of machine is the need that has arisen in recent years for high-potential generators. In many cases a constant current would be far more suitable than an alternating or intermittent one. Wireless telephony would probably have been in common use by now if a good type of high-potential constant-current generator had been available some years ago. Why were not these machines developed and used? Because, I believe, they could not be made sufficiently powerful and reliable.

A most important point in electroculture apparatus is that the generator should be able to charge the whole network to the full potential. This means a machine capable of dealing with much greater outputs than that actually needed for the discharge, especially as there is always considerable insulator leakage to overcome. Trying to run a small generator up to its limit on this work has been responsible for many failures.

The Writer of the Article.

Recruiting and Dilution of Labour.

Admitting the difficulties attending recruiting and dilution of labour, the two following incidents alone show not only what managers of factories have to endure, but also the incompetence or stupidity of the Government representatives.

We are an engineering firm, controlled, scheduled under protected occupations, doing nothing but Class A and B work, most of which is direct Government work. We have only one electrician left in our factory, and he carries out all the testing, comprising insulation resistance, capacity, copper resistance (bridge and potentiometer methods), and extra-high-pressure by means of a motor-generator and transformer up to 50,000 volts. Moreover, he is responsible for the light and power installations of the factory, amounting to some 300 H.P.

In our returns we rate this man as "skilled." The Dilution Officer, with his superlative wisdom, disagrees with us, the man is to be called to the Colours, and provision for a male substitute is not approved. We were warned that this man would probably be called up, and at our invitation the Dilution Officer visited the works, and was shown the various instruments, the nature of the work, and the names of the Government Departments for which the work was required. At the same time, the serious results of the loss of this man were pointed out—it would mean

shutting down, because no substitute could possibly be obtained. Did the Dilution Officer modify his views? No, he rose superior to such trifling consequences. He could then, he no doubt thought, get more men if the factory had to close. Far-seeing man—bump of perspicacity abnormally developed. We have no doubt as to the result of our appeal.

The second case relates to dilution, and we believe is not uncommon. Amongst substitutes sent us by the Labour Exchange was one to take the place of a married man with one child. This substitute, 26 years of age, unmarried, perfectly healthy, was found, after a few days, to have been imported from Ireland by the Government. The natural result is, of course, that the men are to "down tools" unless this Government nominee is dismissed. He will be in a day or two, and without a blessing. Do we express surprise at such outrages? We live on them—they are meat and drink to us. What should we have to do if the Government officials deprived us of these pleasantries?

Carry On.

Captive Balloons and Lightning.

From time to time I hear of this class of balloon being set on fire, while the non-captive, though not altogether immune, is seldom struck. My object in writing is to ask if any of your readers who heard of the destruction of the kite balloon at Roehampton, reported in the *Daily Telegraph* of July 14th, can give particulars of the accident. Was lightning seen to actually strike the fabric or was the gas (the inlet is, I believe, left open) set on fire by a flash in the vicinity?

Are these balloons connected to "earth" under service conditions?

Killingworth Hedges,

Hon. Sec. Lightning Research Committee.

St. Stephen's Club,
Westminster, July 25th.

The Psychology of Power-House Shift Work.

It is most refreshing to read such a sympathetic article on shift work as that in your issue of this week, more especially as the writer says he was formerly on shift work. Our experience has been that the men who are fortunate enough to leave shift work promptly forget the men they leave to do it; and it is a rare thing for a chief engineer who has done shift work, as so many have, to make any attempt to alleviate the discomforts of the shift worker. If we take the case of two men in the same employ receiving equal salaries and doing equally valuable work, we find that if one of these men is on shift work, in addition to inconvenient hours, he works more hours per week than the man receiving an equivalent salary, but who is in the office or some similar post. Why is this?

We are in full agreement with your writer as to the psychological effects of night shift and long hours, and think that a 48-hour week should be the maximum for shift workers, and no shift should last longer than eight hours.

Your contributor states that now is the employers' opportunity to improve conditions; but, in our opinion, the employer will do nothing to improve the lot of shift men unless pressure is applied. The question then arises, how is the pressure to be applied? If we look at things as they are at present in the industrial world, we find the employers banded together to protect themselves by Associations, Federations, and the like; the workmen are united in their Unions; but the *salaried* staffs of minor officials—such as shift engineers, draughtsmen, and so on—have no joint policy; thus they get what is left—usually small salaries and long and inconvenient hours.

We are not members of any organisation; but we are forced to the conclusion that no improvement in the shift men's lot will be made until they have banded together and shown that they speak as one man.

We can substantiate the statement of your writer as to the loyalty of station staffs, and also as to the unrest among them. They will never strike, of course, but employers should realise that a contented and comfortable staff is a great asset in the conduct of any business, and that unless they see to it that the staff is well treated, the good men will keep away and the business will suffer through the inferior quality of its staff.

The up-to-date employer pays his employees as much as he can afford, and not as little as he is allowed to do, with corresponding results in quality and output of work.

Shiftero.

July 23rd, 1917.

Mr. Arnold's very excellent article (published in your issue of July 20th) on the psychology of shift work, touches a matter of extreme importance to the future of power station work. It is well thought out, and comes particularly opportunely from a man who has himself got clear of that rotation of working hours at once so irritating, and so injurious to one's social life and digestion. There is, however, a reference made to the A.E.S.E., in which he entirely misses the mark. To state that the A.E.S.E. apparently collapsed because "it began to meditate militant tactics, thereby proving the loyalty of shift engineers to their employers," is quite erroneous. The great difficulty of the A.E.S.E. was that it had to cater for two distinct classes of men:—(a) Those who were paid by the hour, and regarded their work merely as a job, expecting nothing better than to get more money; and (b), those who were on the staff, and lived in hopes of a chief engineer's position, or

something approaching it. The former were out for Trade Unionism unadulterated, the latter (usually staff men) held aloof for many reasons, chief of which was that it was *infra dig.* to belong to any organisation whatsoever. Hence the A.E.S.E., refusing to cater for the former element, fell into abeyance for want of support from the latter.

Now, as one who has spent the greater part of his working life on shift work, I may say that the true position to-day is this:—The Trade Union element are fast joining the E.T.U. They believe that nothing short of a pistol at the chief's head in the form of a threatened strike can be effective. They are in receipt of the Committee on Production awards, each four months, to meet the increased cost of living, and for them the E.T.U. is an excellent thing.

Now it is these war wages paid to station men in the E.T.U. that are creating the discontent so rife amongst station men of the *infra dig.* class. They cannot see why they do not get the same consideration as the Union men, and will not see that their employers care nothing about their so-called loyalty.

They have not realised yet that employers are not paying the Committee on Production war wages because they want to, but because they are forced to pay all members of the Trade Unions affected by war conditions, hence membership of the E.T.U. gets it for station men.

It is difficult for staff engineers to join the E.T.U. along with the men working under them, and I would suggest two courses open to them:—(1) They can revive the A.E.S.E., calling it the Association of Electrical *Staff* Engineers, and invite members from all electrical engineering works, private and municipal; or (2), they can invite the E.T.U. to form a section for staff engineers. Organise they must, if they are ever to be considered in the industrial conditions of the future.

A. O. Holt.

Manchester, July 30th, 1917.

Symbols for Electrical Tenders.

The ordinary formula for the present value of an annual expenditure is—

$$x = y [1 - (1 + b)^{-n}] / b.$$

If b is taken to represent the *mean* rate of interest for money borrowed and money invested, this is simply the formula which has received the approval of the Sydney Municipal Council, as mentioned in your "Notes" for July 27th last.

Norman Hockley.

Manchester, July 30th, 1917.

LEGAL.

GAS LIGHT AND COKE CO. v. HACKNEY BOROUGH COUNCIL.

ON Wednesday, July 25th, Mr. Justice Asthury gave his judgment in this case. He said: The question of principle which is raised in this action is one of far-reaching importance to the electric light undertakings of this country and to their customers. One of the principal objects of an electrical undertaking is to utilise its plant to the best advantage, and one method of accomplishing this result is to obtain customers for energy during the day as well as during the dark hours, and in each case to encourage customers whose hours of consumption do not synchronise, so that the diversity between them enables the plant to satisfy a greater number of hours of maximum demand than would otherwise be the case. The proportion of the actual number of units sold to the output capacity of the plant is termed in this branch of industry the load factor of the station, and the ratio between the load actually observed at the station and the sum of the loads at the consumers' terminals is termed the diversity factor. Broadly stated, power users have a better load factor and diversity factor than light users, which accounts for their being usually charged a low rate, because, other things being equal, the higher the load factor the lower the cost per unit of production, and the better the diversity factor the further the undertakers can go in the earning of revenue. An increase of the load and diversity factors; therefore, is of the greatest importance, and tariffs should be framed in order to obtain customers and classes of customers whose consumption contributes to this result. This being so, as a general rule it is obvious that a customer or a class of customers with a higher load factor, due to the taking of a different supply in different circumstances, is entitled in the interests of the undertaking to differential treatment in the matter of charges, as compared with the customer or class of customers whose load and diversity factors are inferior. The sections of the Electrical Lighting Act of 1882 which are in question are Nos. 19 and 20. These sections say nothing about and do not draw any distinction between light, heat, or power users as such. The station turns out only one class of energy, which is measured in Board of Trade units, and the dissimilarity of circumstances and the non-correspondence of supply involved in Sec. 19 must be looked for not in the difference in the energy consumed or in the manner in which it is led into and distributed by wiring and meterage in the customers' premises, but in the circumstances of the customer, in so far as they react on the supply that he takes and on the time, diversity, and quantity of consumption. In other words, the pur-

pose to which the customer puts his energy which he purchases, whether for lighting, power, or heating, is, *per se*, irrelevant. It is in the quantum of and the circumstances in which he takes his supply of the one product that the undertaking offers for sale that the answer to the question as to undue preference must be looked for, and it is only for the purpose of classifying customers according to this test that they are for convenience divided into light, power, and heat classes, such purpose involving, as I have already pointed out, well-recognised differences from the point of view of load factor, diversity factor, and the quantity of units purchased. Customers may therefore be, and are, in practice divided into classes in accordance with those considerations, and they are charged with varying and different rates, and classes of rates, with the object of encouraging advantageous customers, and classes of customers, as well as of attempting to fairly adjust the respective advantages obtained by the station from all of them. This has led to what are termed different systems of supply being adopted, that is to say, for lighting, heating, power, &c., the customers in each case taking the only thing that the undertakers had to sell, but in circumstances which affect differently the load factor of the station in both diversity and quantity. If the different systems of supply are fairly arrived at, and are at the choice of the customer, and a preference prohibited by Sec. 20 as between customers dealing in similar circumstances, and not between customers dealing in different systems of supply, either of which they are free to select, is given, and to the extent that customers under one system benefit the undertaking in the way I have described to a greater degree than customers under another—so they are given a benefit in the scale of charges. In the present case, although the wording of the 1914 circular of the defendants, on which the action was launched, may be ambiguous in the sense that the 20 per cent. for light in the case of the power users was not expressly stated to be limited to factory lighting, this was put right in the circular and scale of charges issued in 1916, before the date of the writ, and in practice the defendants have not allowed a user of the 20 per cent. in question for purposes other than the lighting of a factory or workshop having a power supply, nor had they threatened, or intended, to do so, nor apparently has anybody thought that such was the case, and I allowed an amendment of the pleadings raising the 1916 circular in order that the case might be determined, and it has accordingly been argued, on the true facts. In the case before me, all power users are placed on the same basis if all take one supply at the same rate or price per unit, and they are all allowed to use 20 per cent. of such supply for lighting their factories or workshops, which must be lighted by some means or other if they are to take power supply at all. A similar practice has been sanctioned by Parliament in the case of many power companies, as explained in the evidence: that is to say, Parliament has sanctioned power companies competing with lighting companies in various districts on the terms that one-fifth of the supply taken by the power user may be used for light, this being based on the footing that factory and workshop lighting, as a rule, does not amount to, or exceed, one-fifth of the total amount of the energy taken. For the reasons that I have endeavoured to give, I am of opinion that no breach of the provisions of Sections 19 and 20 of the Act of 1882 by the defendants has been established, and that they have not threatened or intended to supply energy otherwise than in accordance therewith. The action must be therefore dismissed, with costs against the plaintiffs.

HIS LORDSHIP, on the application of MR. PERCY WHEELER for the plaintiffs, granted an extension of the usual time for entering an appeal.

M'ERLEAN v. JOHNSTON.

IN this case, heard at the Belfast Assizes, a soldier sued Stanley Johnston, electrical and general engineer, Belfast, for having exposed his son, J. G. M'Erlean, to unnecessary risk at Inver Bleach Works, Larne, where defendant had an electrical wiring contract, in September, 1916. It was stated that as a result the youth, aged 17, who was an apprentice to electrical engineering, met his death by being caught in machinery.

The DEFENDANT denied that the deceased had at the time referred to been employed by him as an apprentice; that he knew any part of the work he had contracted to do was to be done in proximity to dangerous machinery or that it was dangerous by reason of such proximity; that he ordered the deceased to execute the work, or that he knew, or ought to have known, that the deceased was inexperienced and ignorant of the danger. It was further contended by him that there was contributory negligence, and that, admitting the work was dangerous, the deceased knew the risk and voluntarily undertook it.

HIS LORDSHIP decided in favour of the plaintiff, and awarded £150 damages.

A stay of execution was granted.

First Aid in Factories.—The Home Secretary announces that he proposes to make an Order, which will take effect from October 1st next, requiring that all factories employing 25 or more persons, which belong to one or other of the following classes—blast furnaces, copper mills, iron mills, foundries, and metal works—shall provide and maintain "First Aid" boxes or cupboards. In the case of factories employing 500 or more persons, an ambulance room and ambulance carriage will have to be provided.

WAR ITEMS.

The Rebuilding of Belgium.—We have received from Technical Journals, Ltd., 27-29, Tothill Street, Westminster, a 36-page pamphlet, entitled "The Chance for British Firms in the Rebuilding of Belgium." It has been written by a "Belgian Contractor," and deals thoughtfully and informingly with many of the considerations that need to be borne in mind in connection with the immense reconstruction operations that will one day—may it be soon—have to be carried through in Belgium. Unquestionably, one of the first essentials will be money, and the wholesale devastation and robbery that have afflicted the country will render reliance upon outside sources imperative. The author shows that Belgium looks to this country to furnish the necessary capital. Germany occupied a predominant place in the building industry there before the war, and by close study of requirements, by low prices, and by instalment payment systems, secured a large trade. We shall have to meet German competition on its own basis, and unless we are prepared to thus compete, Germany will again secure a footing, and notwithstanding present Belgian intentions to have no dealings with the enemy which has caused so much misery and ruin, Belgians "will be driven against their will into the hands of German manufacturers supplying materials and plant at the lowest prices, and on the most advantageous terms." British firms are advised to study the specifications governing public works in Belgium for information respecting the materials used in construction. It is pointed out in the author's summary that our merchants and manufacturers who wish to supplant the Germans must not rely upon the quality and appearance of their products, but must, as the Germans have done before them, make their goods exactly in conformity with the Belgian official requirements. Building plant has been destroyed or stolen by the Germans, and the works and factories for producing materials that were formerly made by the Belgians themselves are no longer in existence. Belgian law is stated to provide every protection for British firms supplying goods on credit to Belgian contractors. The matter is surveyed in the following brief chapters:—Finance; Machinery and Equipment; Material Supplies; Construction; Commercial Organisation. In conclusion, the writer believes that British ingenuity and enterprise will be equal to the occasion, but our firms are urged to prepare themselves for the work, and to beware of the insidious commercial and industrial methods of the Germans. For three terrible years Belgium has been in the grip, or under the heel, of the Hun. We trust that the time of deliverance will not be long deferred, but whether that be so or no, it is the Allies' determination that ultimately there shall be restoration. What the future will bring, beyond that great fact, must necessarily be under a cloud for the present, but "Belgian Contractor's" contribution is undoubtedly a timely one, which all who wish to take part in that restoration should thoughtfully study.

An Appeal on Behalf of our Sailors.—An appeal has been issued by H.R.H. the Duke of Connaught on behalf of King George's Fund for Sailors. The safety of our shores and the maintenance of our food supplies, indeed, the existence of the Empire, depend upon the endurance and self-sacrifice of "those who go down to the sea in ships," and the nation has an opportunity of showing its appreciation of their services in a practical manner by supporting this new Fund, which was recently inaugurated at a meeting at the Mansion House. His Majesty has consented to become Patron of the Fund, and the Duke of Connaught is president. Contributions may be sent to King George's Fund for Sailors, Trinity House, London, E.C.3.

Entertaining the Wounded.—On July 18th, a number of wounded soldiers were entertained by the employees of the Siemens Wotan Lamp Works, Dalston, N.E. This is another of the series of events arranged for by the Dalston lamp-makers, at their own expense. On this occasion the committee decided on a brake trip to High Beach, and two representatives of the employees were deputed to accompany the party (in two brakes from the Metropolitan Hospital), so that everything possible could be done for their enjoyment. Snokes were provided, and a substantial meal was served at Rigg's Retreat, High Beach. The following committee were responsible for the arrangements:—Miss Crisp, Miss Payne, Miss Fox, Miss Ashton, Miss Ross, Miss Cole. Mr. Price acted as secretary.

Exports to China.—The "London Gazette" for July 31st contains a further list of bodies and persons in China to whom exports may be consigned.

Exemption Applications.—At Calcutta Exemption Tribunal, in May, the application of Mr. Wingfield, agent for the Calcutta Electric Supply Corporation, on behalf of 51 assistants of the company, was under consideration. Mr. Wingfield withdrew his application on behalf of 12 of the men, but applied for absolute exemption for the rest. He wished to know whether the men would be considered to be under the military authorities and whether they would be liable to be called up at any time. If such was the case, it would interfere with his work, and would perhaps cause a

cessation of the activities of his company. It was pointed out that should a contingency arise it was always open to him to represent the matter. "A member of the Tribunal remarked that the military authorities were not so unreasonable as to take away a large number of his assistants, and so handicap his business. The President assured him that the men while on parade would be under the orders of the military authorities, and at other times under his orders. They were, however, liable to perform guard duty. In the end, 10 were selected for general service, and the applications on their behalf were withdrawn. Thirteen were exempted from all service up to the end of the year. Seventeen were exempted from general service up to December 31st, but are to perform general service training, special arrangements to be made for their drills. Several more were made liable for local service, and the applications of two were struck off.

At Southwark, Coun. T. E. Hewitt, electrical engineer, applied for the exemption of three sheet metal workers and a fitter. He stated that he had again applied for certificates under the protected trades schedule for these men, but had not got them. He had visited the Minister of Munitions, and seen the manager in charge of the badge department, who informed him that they were unable to deal at once with the large number of applications for badges that had been sent in. In one case a firm was asking for 100 cards. His application would be dealt with in due course. A further month's exemption was granted.

At the same Tribunal, Messrs. F. W. Hotton & Co., electrical engineers, applied for the exemption of F. W. Hotton, son of the principal, 26 years old, married, passed for garrison duty at home (C1). They were entirely engaged on work for the Government and controlled firms. His son served his apprenticeship with the firm, and was now in charge of over 20 machines, his wages being £4 a week. The Military Representative thought they had better apply to the Minister of Munitions for a card for him. Mr. Hotton replied that they had already put in an application, but got no reply definitely, only a letter that the matter would have consideration. A month's extension was granted to obtain the card.

Conditional exemption was given at Ramsbottom to an engineer (28), Class A, in sole charge of electrical plant. He served in France, and was discharged in 1915.

At Bury, an electrical fitter, in charge of dynamos, motors, &c., at a paper mill (20, single), Class A, was ordered to report on October 1st.

At Burnley, an electrical fitter, aged 20, Class A, was found to be on work of national importance, and was exempted to September 30th.

Temporary exemption to October 31st was given at Clayton-le-Moors to an electrician, 31, general service, who said he was the only electrician in the township.

An electrical firm appealed, at Burlye, for an electrical fitter. Skilled men, it was urged, were very scarce. The men, who was 29, and B1, was given to the end of September.

At the Burnley Tribunal, last week, the Military Representative asked for the review of the exemptions given to 46 motormen in the employ of the Corporation tramways. The Town Clerk said the cases were in respect of men who recently put themselves out of employment by striking, but they were now back at work. Captain Parker said the application for review had nothing to do with the strike. Twelve men were in category A, nine in B1, and four in C1, and he asked that these 25 should be directed to join the Army, after time had been allowed for them to settle their affairs and for the Corporation to find substitutes. Mr. H. Mozley (manager of the tramways) asked that the cases be adjourned until the full list of tram employes was brought up. The Tribunal decided that the time was not opportune to review the cases, and they dismissed the Military appeals. They would be prepared in the near future, however, to consider the whole list, if necessary.

The cases of 12 employees at the Eastbourne Corporation Electricity Works again came before the Tribunal last week. The Tribunal decided that the exemption certificates of nine of the men should be confirmed, and that the cases of three stokers in high medical categories should be adjourned for three months to see if they could be substituted.

Messrs. Marbro, Ltd., applied to the Fulham Tribunal for the exemption of Mr. W. A. Robertson (39, married, passed B1), their works manager. It was stated that the company was formed in 1914 for the purpose of making electrical switches, &c. A large quantity of these goods was formerly imported from Germany. The directors, it was said, had businesses of their own, and took no part in the management. The firm was engaged on Government contracts. Mr. Robertson, who is a special constable and a member of the V.T.C., was awarded four months' exemption.

A review was made at Watford of the case of J. W. Russell (32, Class A), electrical fitter and engineer. It was urged that this was a one-man business, and, after particulars had been given of work done and in hand, the Tribunal withdrew the conditional exemption as from October 18th.

At Bexhill-on-Sea, Mr. H. T. Squirrell appealed for J. F. Gibbs, electrician, and six months' exemption was allowed.

At Weymouth, continued exemption was sought by Messrs. Brooking & Co., electrical engineers, for H. J. Barrow (34, Class A), wireman, and the firm defended a

military review of exemption held by A. Smith (32), wireman. The Advisory Committee expressed the opinion that the work of an electrical wireman could be done by a joiner or carpenter, and Mr. C. H. Wood (Military Representative) mentioned that the military were in urgent need of electricians. Mr. Escott (for Messrs. Brooking & Co.): Why don't they take on carpenters and joiners? Barrow was exempted whilst in the same occupation, and in the case of Smith, his exemption was varied to September 30th (final).

Rochdale Tribunal has refused exemption to J. Hilton (39, Class A), tramway motor examiner, and he is to report for service on August 31st.

Before the Somerset Appeal Court, Mr. A. J. Howard, borough electrical engineer at Taunton, applied for conditional exemption for W. P. Short (28, B1), ledger clerk and relief switchboard attendant. Mr. Howard presented a card from the Ministry of Munitions, which the Chairman said protected Short from being called up, except with the sanction of the Munitions Area Tribunal. Mr. Howard said that the calling-up notice served on Short did not bear the authority named. The Chairman said that the proper course was to dismiss the appeal, and leave the matter to the Munitions Area Tribunal. Mr. Howard had better notify the Recruiting Officer that he held a protection card, and that the man's notice did not bear the proper stamp.

The Military had a review at Watford of conditional exemption held by Mr. M. G. Connari (37, Class A), electrical engineer. The case was heard *in camera*, and the exemption was cancelled, respondent to join up on September 1st.

At Broadstairs, the cases of four of the staff of the Isle of Thanet Electric Traction & Lighting Co. were gone into, those concerned being a permanent-way engineer and three motormen. Mr. Forde, manager, said that the men were indispensable to the working of the undertaking, and were all in certified occupations. He offered to release higher category men if and when the military authorities could provide him with efficient substitutes. The Military Representative asked if it would be possible to release some men by substituting a 20-minute service for the present one of 15 minutes. Mr. Forde replied that if any reduction of that kind became necessary, the directors would probably close the system altogether. Each of the men was granted conditional exemption.

At Ilfracombe, with the assent of the Military, exemption until October 1st was granted to A. H. Friend (33, Class C3), electrical engineer.

Before the Beds. Appeal Court, the Military appealed against conditional exemption held by E. W. Keech (40, B2), engaged with Messrs. Siemens laying cables from a power house to an aerodrome. The firm claimed the man as being thoroughly good at his work, and the Court granted conditional exemption whilst he remains in Messrs. Siemens' employ or in similar work of national importance.

The Essex Appeal Court heard a Military appeal against exemption held by five motormen engaged on the Leyton U.D.C. tramways. Captain Howard said that none of the men were now in certified occupations. Mr. Schofield (tramway manager) said that he had been trying to get substitutes, but after being in training for a month the men tried suddenly found they could not do the work. If he had another two months he thought that he could find men to replace these. Two months were granted in each case.

The Military appealed at Oxford against three months' temporary exemption granted to A. M. Eldridge (29, general service), electrician. The appeal was allowed, and a month's grace conceded.

At Quarry Bank, Messrs. J. Stevens & Co., of Thorns, appealed for an electrician (27), and three months were conceded.

At East Ham, an appeal was filed by R. Cornwall (22, C2), electrician, who said that, owing to an accident, he had lost the fingers of his left hand, which was practically useless. A member protested against the appellant being called up, and Lieutenant Dundas replied that, as an electrician, he would be useful in the Army. Coun. Mitchell: They would put him on picking up paper, or something worse, whereas he is doing good work in civil life. Conditional exemption was granted.

At Winslow, an electrical engineer, dissatisfied with his classification (C2), asked for leave to go to the Central Medical Board, saying that he could not walk a mile. Captain Green said that applicant need not worry about his inability to march; if he were a skilled electrician the Army would be only too glad of his services in that capacity. The application was refused.

On the recommendation of the Advisory Committee, the Rochdale Tribunal has granted exemption until October 31st to H. Smethurst (36, Class A), overhead wireman, appealed for by the Corporation Tramways Committee.

At Llangollen, in the case of Mr. G. F. Evans, engineer to the Electric Light Co., it was complained that he had not complied with the condition that he should join the V.T.C. The secretary to the company, Mr. I. Thomas, said that the drills were arranged in the evening, when the engines were running. Mr. Evans was the only expert in the locality, no one else could do his work, and he contended that he was better engaged where he was than in the V.T.C. The Tribunal continued exemption on Mr. Evans remaining in his present occupation.

TAR OIL FUEL AND DIESEL ENGINES.

IN the discussion on Mr. GEOFFREY PORTER's paper before the DIESEL ENGINE USERS' ASSOCIATION (*ELUC. REV.*, July 13th), Mr. G. W. F. HORNBY, in a communication, said that, in view of the very small percentage of insoluble matter which existed in the tar oil, it seemed difficult to account for the excessive deposit which took place in the pulveriser. He believed that a resultant-gas analysis would be most helpful, as his brief experience of this class of fuel had led him to think that they must regulate the air supply and relatively adjust the clearance to suit the required compression. At present the air supply was constant, or approximately so; the fuel supply depended upon the load and the action of the governor, and incidentally on the state of the pulveriser and needle valve. When the air supply was right for the amount of fuel to be burned at a certain load, then, it seemed to him, the lighter the load the more the air would be in excess of requirements; hence, an impoverished state of combustion (this characteristic was very noticeable in oil-fired furnaces), and was it not, due to this condition of air supply that the pilot ignition was made use of? The question of storage in cold seasons was an important one; he believed that a simple agitator of the paddle type would be sufficient for storage tanks made from old boilers. Keeping the tanks warm had a decided advantage in maintaining a uniform temperature of the oil in stock, but if the heating was done with the waste gases from the engines, the outside of the tanks would need to be specially treated, as the acids formed in the gases were very active when combined with moisture and in contact with plain metallic surfaces.

Mr. F. W. STRICKLAND, in a communication, said he found that his two engines drove their alternators in parallel as steadily as when burning crude, if the amount of ignition oil was about doubled (the larger amount being 1 gal. per hour for a three-cylinder 150-B.H.P. engine) by advancing the control lever a little, but they were very unsteady with the normal quantity of ignition oil, although when running on the same load separately they appeared to fire perfectly. He had found starting on tar oil most unreliable, and liable to cause very heavy explosions, and now always shut down on crude, so as to prime for the next start.

Mr. J. M. FERGUSON, in a communication, said that the suitability of the fuel seemed to depend chiefly on the insoluble contents. With regard to flash point, his experience was that this might be in the neighbourhood of 90 deg. C. (194 deg. F.) without causing the slightest difficulty. It was found during the course of tests at his works that tar oil could be used as ignition oil with satisfactory results down to 1/4 load. His experience was that the quantity of ignition oil need not exceed 5 per cent. of the weight of ordinary fuel oil used at full load. Possibly under regular running conditions it might be advisable to increase this slightly, say, to 7 per cent. Had Mr. Porter tried running the engine for, say, five minutes on paraffin before stopping, with a view to getting rid of the deposits in the pulverisers and passages? The fuel consumptions given seemed very low, as a consumption of .66 lb. per kw.-hour at three-quarter load on a set of this size would be less than .44 lb. per B.H.P.-hour, which would be a good figure with residual petroleum.

Mr. H. S. RUSSELL gave the result of the further experience which his firm, as manufacturers, had had during the past 18 months. It was regrettable that the price of tar oil had increased lately, and he was afraid that was due, not so much to the demand for the tar oil as to the fact that many different people had approached the tar distillers independently with a view to obtaining the oil, and so had given the distillers exaggerated ideas as to its value. It did not follow that because a particular design of pulveriser gave satisfactory results with a particular class of tar oil, it would be equally satisfactory with other tar oils. Their object with the pilot ignition system was to make it applicable to any standard engine with a standard pulveriser without having to make special alterations to suit varying classes of fuel oils. With regard to specifications of tar oil, he did not agree that it was important to keep the percentage of matter insoluble in xylol as low as German specifications required; a good deal depended upon the constitution of the insoluble matter. The insolubles were merely foreign matter—generally free carbon, dirt, brickdust, scale off boiler sides, &c. These must not be confounded with ash, which was, of course, the unburnt residue after the combustible foreign matter had been burnt. His firm had run engines satisfactorily on tar oil which contained as much as 8 per cent. of free carbon, but would not recommend so high a percentage. He considered Mr. Day's figure of 2 per cent. of matter insoluble in xylol quite a reasonable one, and as much as 5 per cent. might not be objectionable provided it was combustible. He thought Mr. Porter attached too much importance to the question of sulphur. While a high coking residue usually meant carbonising of the piston tops and exhaust valves, this was the only trouble, and it was not necessary to reject oils on this account. Mr. Day's figure of 3 per cent. was probably too low, but it should ensure an exceptionally good oil. Anything in the neighbourhood of 10 per cent. was too high, but the oil would not be unusable. He did not think that the flash point need be much considered, as it was no real indication of the composition of the oil. He confirmed Mr. Porter's

statement that the overall thermal efficiency when working with tar oil was slightly higher than with petroleum fuel oil; this was due to the lower viscosity of tar oil, which meant better pulverisation and quicker burning at the top of the card. In their experiments on the matter they obtained the highest overall thermal efficiency with alcohol. With regard to the choking of the pulverisers, their experience showed that it was only with the tar oils rich in naphthalene that the choking occurred. There were two crystalline bodies in tar oil, naphthalene and anthracene; the latter was in smaller quantities, and mainly present in the high boiling fractions. The effect of both was quite similar, and the two together were responsible for the solidification in tar oils. The disadvantages of using tar oil without pilot ignition were that one had nothing like so wide a choice of oils, and therefore could not depend so much on getting suitable supplies; also to get reasonably good working, it was absolutely essential to have increased compression. With the pilot ignition, one could work with 480 lb. compression, but without it he thought that not less than 600 lb. would be required. It was also usual when running on tar oil without pilot ignition to use hotter circulating water, and this, of course, increased the liability to deposits in the water jackets.

Mr. G. NEVILL HUNTLY said that the water content was frequently distributed very irregularly in the fuel oil, and the sampling difficulty must be met by taking a large sample for this determination. The gross calorific value should always be asked for, and the necessary calculations for the net figure made by the engineer. The gross value was a definite experimental figure, but there were several "net" values in use, based on different definitions. The percentage insoluble in xylol was simply a measure of the suspended matter in the tar oil, and a high percentage of suspended matter was regarded as likely to cause trouble in the pulverisers, as it might form nuclei for the deposition of carbonised material. There seemed no reason from the chemical point of view why naphthalene should cause trouble in the pulverisers. It melted at about 80 deg. C., and would be in solution in the oil at temperatures below this.

Mr. E. A. EVANS agreed that it would be unwise to formulate a rigid specification for tar oil at present. Our knowledge of tar oil as a fuel was far too meagre to make more than very elastic suggestions to guide would-be purchasers of tar oil. Specific gravity should be determined with the aid of a specific-gravity bottle in preference to a hydrometer. Prior to the determination of free carbon the oil should be filtered through fine lawn to remove pieces of wood, &c. The simplest method of testing for free carbon was to examine the oil under a microscope. If the carbon were in a colloidal state it would not give any trouble, but if it were flocculated, or coarse, trouble must be expected. Coke residue was purely an arbitrary figure obtained by a method which had not even been standardised, hence different experimenters were liable to report different results. Consequently, it was advisable to specify the *modus operandi* when submitting a sample of tar oil to a chemist. He agreed that the gross calorific value should be stated. Suppliers would always give the higher value. The differences between the hydrogen content of various tar oils were not great; therefore, it mattered little whether the "gross" or the "net" value was adopted. It was most desirable to keep the ash as low as possible, because any unburnt substances might choke valves, act as abrasives on moving parts, and exert a deleterious action upon the lubricating oil. As tar oil did not usually contain more than 1 or 2 per cent. of sulphur they need not be anxious about this factor. The action of sulphur upon the lubricant was always overlooked, but it should not be. The efficiency of tar oil as a fuel was largely dependent upon the mode of feed, &c. Much trouble was encountered by choking pulverisers. This did not appear to be due to impurities in the fuel, but to chemical action.

Mr. P. H. SMITH remarked that as a result of service trials of over 40 different tar oils which were subsequently analysed, he was inclined to characterise the constituents of tar oil insoluble in xylol, and ash, as undesirable. They should be as low as 0.1 per cent., as a quantity greatly in excess of this appeared to be associated with piston seizures in the larger engines. An oil rich in coking residue generally contained a high proportion of naphthalene. One or both of these elements made for safety, that is to say, allowed of the engine being run at smaller loads than would otherwise be possible without danger. An oil containing coking residue amounting to about 5 per cent. appeared to give best results in service. The difficulties experienced through naphthalene crystals might be satisfactorily overcome by adopting one of several proposals, one of which was an addition of crude oil. In the coldest weather of the past winter a mixture of 25 per cent. crude oil with 75 per cent. tar oil had not, apparently, been attended with the phenomenon of crystallisation, so apparently the proportion of crude could be further reduced. With blended oils the engine operated with greater reliability than on straight tar oil, provided that the tar oil content was judiciously selected. The minimum safe load with engines to which no special adjustments had been made ranged about 0.8 of full rated load. An English invention, not yet fully developed, apparently was "safe" throughout the full range of load of the engine. Two special adjustments appeared to have been adopted to burn tar oil in Diesel engines, whatever

system was adopted. The timing of the opening of the fuel valve had been advanced from 2 deg. to 3 deg., and a slightly smaller flame plate had been fitted. This combination gave a rather peaky card, which had already come to be generally recognised as the most satisfactory for engines working on tar oil. A year or so ago it was generally thought that high compression and high cooling water temperature greatly assisted in burning tar oil without special apparatus. Engines which were working with fair satisfaction under these conditions gave better results with a normal compression of 33 metric atmospheres and an outlet temperature of the cooling water about 100 deg. F. as against 160 deg. F. One such engine was now generating 94 to 95 per cent. of its output on tar oil, and the fuel consumption was barely 6 per cent. greater than on crude. Sleeve pulverisers had been in operation some considerable time, and he had not yet had it reported to him that any had choked.

Mr. C. T. WESTLAKE said that at Guernsey they were troubled with the pulveriser cones and ring choking, and had used sleeve pulverisers to overcome this. These also helped in running on low loads. Their engines ran without pilot ignition, and used a compression of 480 lb.; the cooling water was kept between 100 deg. and 120 deg., as they found no advantage in running at a higher temperature. The chief disadvantage of working without pilot ignition was in not being able to run at low loads. Where engines had to run at low loads it would be quite satisfactory to run with one cylinder cut out. The remaining cylinders would be working more efficiently. He did not believe in stirring the oil to overcome crystallisation. The oil contained impurities which were best left to settle out at the bottom of the tank.

Mr. GEORGE B. VICKERS said that Messrs. Hick, Hargreaves and Co. had put down a large three-cylinder engine purely for experimental use. Experiments were being carried out, and he had every reason to hope that tar oil would be successfully used right down to light load without the assistance of pilot ignition. Until reliable data had been obtained those users who were compelled to change over to tar oil, and who had to run frequently below, say, half-load, were well advised in using pilot ignition. They should aim at simplifying the Diesel engine, and if adjustment for tar oil could be made by a re-designed pulveriser and flame plate which would equally suit tar oil or petroleum oil, he thought that this was the right line of action, rather than an uncontrolled pilot pump, which certainly did not simplify the engine.

Mr. W. A. TURNBULL said that mixing tar oil and crude oil, in his experience, had been most unsatisfactory. He had now been running on tar oil since August, 1916, with perfect satisfaction, without pilot ignition. At first the pulverisers blocked up, requiring a high blast, but now every five hours they ran for 15 minutes on crude oil or paraffin, and the engine ran 300 hours without cleaning the pulverisers; even then it was really not necessary to clean them. From September, 1916, to May, 1917, the Diesel engine plant at Aylesbury generated 369,345 units, with a consumption of 75,248 lb. of crude oil (residual petroleum oil) and 194,000 lb. of tar oil. This corresponded to an average of .73 lb. of fuel oil per unit, as against an average of .69 lb. of fuel oil per unit when crude oil alone was used. On particular tests he obtained a result of .65 lb. of crude oil per unit, and .735 lb. of tar oil per unit. In both these cases the test was carried out at full load.

Mr. NAPIER PRENTICE, in a communication, said that without pilot ignition the consumption of residual petroleum at Felixstowe was only 10 per cent. of the fuel used, and, therefore, compared equally well with pilot jet ignition. Their tar oil had been practically free from naphthalene, and yet they found it advisable to clean the pulverisers after 50 hours' running. With a comparatively poor load factor and small output, they had saved £300 to the end of May by the use of tar oil, and this with no capital outlay.

Mr. PERCY STILL, in a communication, said that the results of tests on samples of tar oil obtained from the same source varied very considerably, and to check some of these results it was decided to send precisely similar samples simultaneously to two laboratories to be tested. Both of these laboratories had had considerable experience in carrying out tests on fuel oils. Particular care was exercised in taking the two samples at the same time and in the same manner from the same bulk of tar oil. These were placed in similar cans, which were then sealed and sent to be tested at the two laboratories. The comparison of the results obtained might be of interest:—

	Laboratory A.	Laboratory B.
Flash point	(Closed) 165° F.	(Open) 197° F.
Sulphur	0.95 %	2.12 %
Water	1.57 %	2.9 %
Coke	13.8 %	8.39 %
Solid matter insoluble in xylol	0.12 %	0.48 %
Ash	0.19 %	0.02 %
Acidity	Nil	Trace
Percentage by weight distilling below 300° C.	57.5 %	73.10 %
Specific gravity at 60° F. ...	1.057	1.053
Viscosity, Redwood No. 1, at 60° F.	76 sec.	70 sec.
Calorific value, B.T.U. per lb.	17,030	16,532

Mr. GEOFFREY PORTER (President) replied in detail to the points raised in the discussion. Incidentally, he drew attention to the enormous discrepancies between the chemical analyses quoted by Mr. Still.

BUSINESS NOTES.

Useful Compositions.—A cement that sets like stone, and can withstand a temperature of 1,100° C., has obvious uses in engineering. These qualities are claimed for "Permanite," an adhesive cement made by the NATIONAL CHEMICAL WORKS, LTD., Stanley Road, South Acton, London, W., which sticks to anything, and resists the action of oil, acid, petrol, &c. It is useful for making oil-tight joints, fixing articles in metal sockets, attaching canvas, &c., to metal, and a variety of other purposes.

A somewhat similar composition made by the same company is "Pulleystone," a "pink paste put on pulleys," which sets hard, and is claimed to double the adhesion of the belts. It is not a belt dressing; it is applied once only, and forms a new and permanent surface, which grips the belt, without wearing it as much as the usual iron surface does. The belt can be run slacker, diminishing the friction loss, and at shorter centres, thus saving space.

Openings in Italian Markets.—List No. 33 issued by the British Chamber of Commerce for Italy (Inc.), Genoa, includes the following inquiries from Italian firms, many of whom formerly did business with German and Austrian houses:—

No. 1,322.—Florence firm would buy for own account (or represent on commission):—Electrical material and lamps, ironmongery, hardware, copper sheets and bars, &c.; F.G.F.

No. 1,401.—Italian firm at Bari wish to represent manufacturers of motors, machinery, and tools, for agricultural, electrical, and building purposes; B.C. & T.

No. 1,401.—Genoa engineers would represent firms manufacturing or exporting: Electrical material, chemicals, also steel, tools, and general machinery and engineering articles; G.P.C.

No. 1,406.—Engineer, manager of a mining company, would represent British manufacturers of industrial machinery in general, especially for shipbuilding; I.A.G.

No. 1,412.—Rome firm would represent on commission or buy for own account:—Electrical articles, lamps, insulators, lampholders, switches, &c.; R.G.B.

No. 1,414.—Party at Venice would represent on commission manufacturers and exporters of:—Machinery, tools, aircraft motors, engineering articles, &c.; V.A.M.

No. 1,415.—Genoa representatives would handle on commission:—Gas and electric stoves and fittings, &c.; G.A.G.

No. 1,419.—Commission agent at Genoa is open to handle:—Metals, belting, engineering supplies; G.L.F.

Dissolutions and Liquidations.—VAUGHAN ENGINEERING WORKS, LTD., 22, Cross Street, Islington, London.—Winding-up order made July 24th.

LEITNER ELECTRICAL CO., LTD., Woking.—August 23rd is the last day for the receipt of proofs for dividend by Mr. G. E. Corfield, the liquidator.

UNIVERSAL CABLE CODE (PARENT) CO., LTD., London.—Liquidator (Mr. H. de V. Brougham) released July 25th.

THEROL FOREIGN PATENTS SYNDICATE, LTD.—A meeting is to be held at Bank Chambers, High Holborn, on September 5th, to hear an account of the winding-up from the liquidator, Mr. H. M. Bayly.

ROBINSON SHIELDS CO., dealers in electrical goods and appliances, Kingsway Hall, Kingsway, W.C.—Messrs. W. Y. Robinson and A. J. Shields have dissolved partnership. Mr. Shields will continue the business under the old style, and will attend to debts, &c.

Bankruptcy Proceedings.—RALPH ROBINSON GREENWELL (otherwise Gordon Granville), a director of the Harvey Electro-Chemical Co., Ltd.—An application was made to Mr. Registrar Mellor at the London Bankruptcy Court on Friday, July 27th, for an order of discharge. The Official Receiver reported that the bankrupt failed in September, 1914, with ranking liabilities £5,020, and assets valued at £203, but which had produced only £31 11s. 4d. In 1912, with money borrowed and still owing, the bankrupt subscribed for £500 shares in the Harvey Electro-Chemical Co., Ltd.; in February, 1913, he became a director of that company, but in February, 1914, a Receiver was appointed. He attributed his insolvency to the depreciation in the value of his shares, to the stoppage of his business owing to the outbreak of the European war, and to a judgment obtained against him by Mrs. Gordon, the petitioning creditor, for £750 paid to him to be expended in the purchase of fully-paid shares in the Harvey Electro-Chemical Co., Ltd. As offences against the Act the Official Receiver reported (1) insufficiency of assets to equal 10s. in the £ on the amount of the unsecured liabilities; (2) omission to keep proper books of accounts; (3) contributing to the bankruptcy by rash and hazardous speculations; and (4) misconduct in having failed to apply to the purpose for which he received it, £750 handed him by the petitioning creditor for the purchase at par of fully-paid preference shares in the Harvey Electro-Chemical Co., Ltd.; also misconduct in failing to attend for the public examination, and to obey an order of the Court in relation to his statement of affairs. The learned Registrar said the serious part of the case was the misconduct of the bankrupt. He received £750 from Mrs. Gordon for the express purpose of purchasing fully-paid preference shares in an electric company; he appeared to have spent £400 in the purchase of fully-paid ordinary shares, and with the balance he purchased preference shares that were only partly paid; he had never handed over to the lady any fully-paid shares, and the result seemed to be either that he had put this money in his pocket, or else he had spent £400 of it according to her instructions, and having acted upon it he had never handed her the shares. Later, being hopelessly insolvent, he had offered her shares which were

not fully paid. He defended the action brought by the lady for recovery of the money, but judgment was given against him, and these bankruptcy proceedings ensued. He was also guilty of misconduct, in that he had absented himself from the Court from February, 1915, until a warrant was issued against him in May, 1917. All the offences reported by the Official Receiver had been established, and the discharge must be suspended for three years. Order entered accordingly.

Catalogues and Lists.—MESSRS. PASS & SEYMOUR, INC. (U.S.A.).—Circular tabulating particulars of Dim-a-lite adaptor lampholders, together with a copy of a report of examination made for the Benjamin Electric, Ltd., by the National Physical Laboratory.

MR. GEORGE ELLISON, Wellhead Lane, Perry Barr, Birmingham.

—List No. 131, dealing with cable fittings, &c., for attachment to ironclad switchgear of the industrial type, with prices, dimensions, and weights. A novel feature of "Ellison" cable adaptors and fittings is a patented cone clamp for the armouring, which can be easily cut on site to suit any ordinary cable. No special drilling on site is required, and the cone clamp affords efficient means of bonding the armouring or other cable covering to the switchgear case for earthing purposes.

MESSRS. ROSE BROS., 25-27, Milton Street, London, E.C.—Priced leaflet describing the R.B. "Admant" electric pipe lighter.

Book Notices.—*Hints on Rectifying Faults in Motor Control Gear.*—Mr. George Ellison, of Birmingham, has sent us a copy of the pamphlet above named, which has been published with the view of assisting electricians in charge of electrical plant, as well as purchasers of protective switchgear. It is one of those excellent manufacturers' specialist publications which, as we have often pointed out, are packed full of practical wisdom and knowledge based upon prolonged experience, dealing with a subject far more fully than any text-book can, and designed expressly to furnish the maximum amount of information to the reader who uses the apparatus of which it treats. Starting at the very beginning—the wording of the order for switchgear—the author shows how numerous are the opportunities for error or omission in describing the requirements of the purchaser; he then passes on to the consideration of the working conditions of starters and controllers, the different methods available for starting motors, causes of failure, the care of switchgear, pressure rises, oil tanks, inching, braking, &c. A few pages of illustrations of the publisher's own well-known and justly esteemed controlling gear are appended. The booklet will be of great value to many besides those for whom it is written.

Preliminary Mathematics. By Prof. F. E. Austin. London: E. & F. N. Spon, Ltd. Price 8120.—This book is intended to form a connecting link between the study of arithmetic and the study of algebra, and should be used as an auxiliary, in conjunction with other text-books; its chief object is to show how to solve problems, and how to apply theory to practice. Hence it consists very largely of worked examples, and problems to be solved by the reader. The author has a very lucid style, and leads the student on by gentle steps from the most elementary ideas up to the use of logarithms, the solution of equations of the first degree, quadratics, progressions, &c. Various actual examination papers are appended, with complete solutions to the problems.

"Production." Monthly report of the British Empire Producers' Organisation. London: Kingsway House.

"Correction Tables for Thermodynamic Efficiency." Calculated by C. H. Naylor. London: E. Arnold. Price 5s. net.

"Heat Drop Tables: Absolute Pressures." Calculated by H. Moss. London: E. Arnold. Price 5s. net.

"Practical Costing." By A. H. Gledhill. London: The Gledhill-Brook Time Recorders, Ltd. Price 3s. post free.

"Proceedings of the American Institute of Electrical Engineers." Vol. XXXVI. No. 7. July, 1917. New York: The Institute. Price \$1.

"The Predetermination of True Costs and Relatively True Selling Prices." By F. A. Parkhurst. London: Chapman & Hall. Price 5s. 6d. net.

"Directions for Designing, Making, and Operating High-pressure Transformers." Second edition. By Prof. F. E. Austin. London: E. & F. N. Spon, Ltd. Price 3s. net.

Holidays.—The works of MESSRS. RHODES MOTORS, LTD., are to be closed from to-night (Friday) until Monday, August 13th, for the annual holidays.

The works and offices of the HOFFMANN MANUFACTURING CO., LTD., Chelmsford, will be closed from noon to-morrow (Saturday), until the morning of Monday, August 13th, but urgent correspondence and orders received between August 7th and 11th will be dealt with.

For Sale.—THE LONDON ELECTRIC FIRM, Brighton Road, Croydon, are offering for disposal a Croydon factory (about 5,000 ft.) with shafting, motors, &c.

Cricket.—At Dagenham, on Saturday last, an interesting game was played between the Sterling and Marconi Lady Cricketers, the home XI winning by 60 and 86 to 39 and 34. The fielding of the visiting team was particularly smart. Mr. Guy Burney, the president of the club connected with the Sterling Works, in a happily expressed speech, gave the visitors a hearty welcome. Mrs. Guy Burney kindly entertained both elevens and friends to tea.

LIGHTING AND POWER NOTES.

Argentina.—The electric light company at Las Varillas (Province of Cordoba) has affixed posters throughout the town notifying that the service will be suspended as from July 1st owing to the accounts for the past four months not having been met.

Another company—the *Compania de Electricidad de la Provincia de Buenos Aires*—is experiencing difficulty in collecting the amounts due to it from several municipal authorities in the Province of Buenos Aires. The total of municipal debts to the company is \$781,342.

The *Compania Italo-Argentina de Electricidad* has entered into an agreement for the supply of electricity to the *Compania de Tramways Eléctricos del Sud*.—*Review of the River Plate*.

Australia.—The Sydney City Council has accepted the offer of the Railway Commissioners to supply electricity up to a maximum of 4,000 kW. for a period of two years, the Council paying the Commissioners £6,000 per annum for the maximum load of 4,000 kW. and 0.3d. per kW.-hour for all power supplied: under this arrangement the payment will be dated from the day on which the converting plant and electrical equipment were completed.—*Tenders*.

Barrow-in-Furness.—The electrical engineer has been nominated a member of the Barrow Coal Supply Committee to interview the Coal Controller, with a view to obtaining coal from Lancashire instead of Northumberland and Durham, as proposed in the new scheme.

The Electricity Committee has agreed to contribute £2 2s. per annum to the work of the Research Committee on the heating of underground cables.

Bath.—PRICE INCREASE.—The Electricity Committee has decided to increase the present charges by ½d. per unit for lighting and 5 per cent. for heating.

Batley.—YEAR'S WORKING.—The annual statement of accounts of the Corporation electricity department, just issued, shows a loss of £186 on the working of the year ended March 31st. These accounts show the first full year's working of the three-phase E.H.T. alternating-current installation, including a turbo-generator of 1,200 kW., two rotary converters, switchboard, and water-tube boiler, which, with extensions of mains and sub-stations, involved an additional capital outlay of between £15,000 and £16,000, and gave rise to expectations of so lowering the costs of production that better profits would be made. These expectations have failed to materialise owing to the increased cost of coal and reduced consumption of current, owing to the war, and the result is a loss of £186, as compared with a profit of £173 in the previous year. Mr. S. Derwen Jones, the borough electrical engineer, in his report, shows that great economy has really been affected by the working of the new plant, and he shows a reduction in working costs (apart from interest and sinking fund) from 1'08d. to 0'975d. per unit. The war, he states, prevented the completion of the cable extensions, and thus some firms who intended to take an alternating supply have been unable to do so; some of the night load also has fallen off owing to the shortage of workpeople in the industries. The fact that the bulk of the present supply is continuous current, necessitating conversion from the alternating current supply, involved a loss during the year of about 11 per cent.—a loss which must be proportionately smaller to the total load as the alternating current load increases. Owing to restricted lighting and the Summer Time Act, the lighting supply fell off 7½ per cent. The traction load increased slightly by 3,594 units, whilst the power load increased by 282,113 units, or 37½ per cent., maintaining the steady increase of the past five years. Mr. Jones advocates that, as the lighting load has tended to become more and more a purely winter load, any contemplated increase in the price of current should be on the lighting only, and that the 7½ per cent. should be raised to 12½ per cent. The consumption of coal has been reduced, and the coal per unit generated has been brought down from 57 to 4'01 lb. The cost of coal on the year, including carting, tipping, &c., had been reduced from 0'54d. to 0'455d. per unit sold.

Birmingham.—PRICE INCREASE.—The Electric Supply Committee recommends that the new scale of charges, which increases the existing charges by approximately 15 per cent., should take effect as from the Michaelmas reading of the meters.

Bournemouth.—PRICE INCREASE.—The Bournemouth and Poole Electricity Supply Co., Ltd., has advanced the price of current, from the date of the Michaelmas quarterly meter readings, by a further 5 per cent., making an increase during the war of 20 per cent.

Bradford.—PRICE REVISION.—The Electricity Committee is recommending the Corporation to increase the charges for current as follows:—Power consumers having maximum demands of under 5 kW., and power consumers on the restricted hour rate, to pay an additional 20 per cent. The accounts of all other consumers which are not subject to adjustment in accordance with the price of coal (with the exception of the tramways department and consumers charged on the flat rate) to be increased by 10 per cent. For heating and cooking, current to be supplied at a flat rate of ½d. per unit, plus 10 per cent. to consumers already taking supplies for other purposes at the premises concerned.

Bristol.—FRINGE ORDER.—Negotiations have been concluded for supplying the Hanham Colliery at a point beyond the supply area, and the B. of T. is to be asked to grant an Order under the E.L. Act, 1909, to enable this arrangement to be completed.

Croydon.—PRICE INCREASE.—In view of a loss of £3,100 (which will be reduced to about £1,100 by retrospective repayments) on the last year's working of the electricity undertaking, and an estimated loss of £4,210 during the present year, it has been decided to increase the charges for electricity by 15 per cent., in addition to the 10 per cent. approved in May, 1916. This will still leave an estimated deficiency of £1,200 at the end of the present year.

Deal and Walmer.—The D. & W. Gas and Electricity Act has been extended for a year.

Derby.—PROPOSED LOAN.—The T.C. has approved a scheme for the supply of electrical energy to additional works proposed to be erected for chemical manufacturing. It has also decided to make application to the L.G.B. for sanction to the borrowing of £90,000, the estimated cost of the new electrical plant necessary.

Edinburgh.—PROPOSED PRICE INCREASE.—The Electric Lighting Committee recommends that an increase should be made in the charge for private lighting from 3½d. to 3d. per unit, and that the charge for power should be increased from the present rate of 1½d. plus 5 per cent. to 1½d. plus 10 per cent. This charge does not affect special agreements. The charges, if adopted, will take effect as from May 15th last. The estimated expenditure of the department for the year 1917-18 is £102,820, and the revenue is £156,290 on the old rates, but if the proposed increases are adopted, an additional sum of £3,000 is calculated upon.

A deputation was received by the Corporation Electric Lighting Committee from the East of Scotland Cinematograph Exhibitors' Association, who complained of the charge made for inspection of their electrical installations. These inspections are ordered by the magistrates, and the electricity department holds that, as it is an ordinary trading concern, it does not fall within its duties to provide inspectors for this public purpose except on reasonable charges. The Committee is to have a meeting with the magistrates regarding the matter.

Heston and Isleworth.—YEAR'S WORKING.—The report of the electrical engineer on the working of the U.D.C. electricity undertaking for the year ending March last—the 12th year of the concern—shows that the total income was £12,015, an increase of £768 over the previous year. The total working expenses were £7,100, an increase of only £68, leaving a gross profit of £4,914. After providing for interest and loan charges, amounting to £4,922, there was a net deficit of £7. There was an increase in units supplied for power of 29,490, and of those for private lighting of 15,180. On the other hand, the units for public lighting have decreased by 116,219, which gave a net decrease in units sold of 71,549. Dealing with the output, he shows that 1,608,588 units were generated, an increase of 41,115, and the number sold was 1,216,822, of which 890,980 were for power. The average price per unit showed a gain of 35d. per unit. The works costs had risen from 1'23d. per unit sold to 1'33d.

High Wycombe.—STREET LIGHTING CHARGES.—The T.C. has decided to lodge an appeal in connection with the recent action for £1,290 successfully brought against the Corporation by the Electricity Co. in regard to street lighting. The Judge considered that he was bound by the decision in the case—*Leiston Gas Co. v. the Leiston R.D.C.*

Ilford.—The Electricity Committee of the Council has instructed its electrical engineer to communicate with the Coal Controller with regard to the utilisation of steam from the destructor. After negotiations the Coal Controller agreed to request the Ministry of Munitions to grant the necessary priority certificate to carry out a temporary steam scheme to make use of the steam now being wasted. It is proposed to transfer a 200-kw. set from Ley Street, and run cable from the destructor to Meads Lane, at a total cost of about £600. At a joint meeting of the Electricity and Lighting and Tramways Committees, the charge for electric current to the tramways for the year ended March 31st, 1917, was fixed at 1½d. net per unit. The Director of Electric Power Supply at the Ministry of Munitions has notified that he is prepared to approve a scheme of extension to certain works. The L.G.B., upon being referred to, requested that when tenders for converters and cable had been obtained, the Board be furnished with a detailed estimate of the cost.

Kingston-upon-Hull.—The extension order has been further extended by a year.

Leek.—SUGGESTED LINKING-UP.—The U.D.C. has received a communication from Stoke-on-Trent Corporation suggesting that the respective electricity committees should meet, with a view to discussing the possibility of supplying electrical energy or the preparation by the respective electrical engineers of a scheme for linking-up the two systems. The Council decided to agree to the suggestion.

London.—L.C.C.—The Finance Committee recommends the sanction of the Council to the borrowing of £1,441 by the Battersea B.C. for the extension of electricity mains; £3,746 by the Bermondsey B.C. for a new electricity main; £1,000 by the Bethnal Green B.C. for house connections; and £3,500 by the Hackney B.C. for mains, transformers, &c.

L.C.C. THEATRE INSPECTIONS.—The Theatre and Music Halls Committee reports that recent inspections of the electrical and mechanical installations at places of public entertainment show a marked falling off in the standard of maintenance and repair, due partly to the difficulty of getting repairs executed and partly to the employment of unskilled men. Owing to the depletion of the Fire Brigade staff, the Committee in 1915 approved of a reduction in the frequency of inspection; but the Committee is now of opinion that in the interests of public safety more frequent inspections are necessary.

L.C.C. AND ELECTRIC SUPPLY DEVELOPMENTS.—The L.C.C., in a letter to Borough Councils owning electricity undertakings, refers to the conference, two years ago, between its Special Committee on London Electricity and representatives of London Councils and London companies, upon the question of electricity supply in London, and states that recent events have given rise to a situation which renders it desirable that a further conference should be held at an early date.

ISLINGTON.—The Electric Lighting Committee recommends that application be made to the L.C.C. for sanction to the borrowing of £53,000 for various extensions to the electricity undertaking. The Government authorities concerned are prepared to support the application.

SOUTHWARK.—The electrical engineer reports that the working of the "Summer Time" Act has made a serious reduction in the output, the lighting demand being practically non-existent after the power load goes off in the evening. The falling off in the consumption of electricity, together with the increase in wages and the continued rise in the cost of materials, makes a further increase in the lighting rate unavoidable. The Committee decided that the following rates shall come into operation from September 30th, 1917:—Lighting, 6d. per unit for the first 1,200 units per quarter; 5d. for the second 1,200 units; 4d. for the third 1,200 units; 3d. for all over 3,600 units. Two-rate (combined lighting and power), 8d. per unit during "restricted" hours; 2d. during "unrestricted" hours.

Meltham.—PROPOSED E.L.—The U.D.C. has under consideration the proposal of the Huddersfield Corporation to apply for a Provisional Order to supply electricity to the Meltham area. The Corporation is to be asked to receive a small deputation from the Council to discuss the matter further.

Plymouth.—The Corporation has decided to apply to the B. of T. for sanction under Regulation B 1 to disconnect classes of non-essential consumers in cases of urgent necessity, in order to enable the supply to be continued to essential users.

Stockton-on-Tees.—YEAR'S WORKING.—The total revenue of the electricity department for the year ended March 31st, 1917, was £10,351; expenses amounted to £6,084; and, after meeting financial charges, there was a net loss of £1,138. A total of 1,717,923 units was sold, while 566,260 units were generated and 1,271,827 units were purchased on bulk supply terms (35d. per unit).

Sutton.—In reference to our note of last week in regard to the enforcing of the minimum charge of 13s. 4d. per quarter, on the present occasion the six summer months are to be regarded as one quarter for this purpose.

Todmorden.—WAGES.—The Corporation employees' application for increased wages is to be referred to arbitration, the men having refused the Council's offer.

U.S.A.—The Senate and House of Representatives have agreed to the conference report on the Bill permitting the present maximum diversion of 20,000 cu. ft. of water on the American side of Niagara Falls. The measure carries an appropriation of \$25,000 for an investigation by the War Department. But for the legislation just enacted, 50,000 H.P. would have been cut off on the American side of the Falls.—*Electrical World*.

West Bromwich.—The T.C., last week, decided to spend £2,300 in extensions to plant at the electricity works, which, it was stated, would enable the department to practically double the output. Last year there was a net loss of £4,696, largely due to the fact that the department was under contract to supply several large consumers at pre-war rates. An agreement has now been arrived at, however, whereby these consumers will help the department to meet the deficit.

York.—PROV. ORDER.—The B. of T. has extended the period for one year for carrying out the York Electric Lighting (Extension) Order, 1914.

YEAR'S WORKING.—The annual accounts of the Corporation electricity department for the past year show a total revenue of £41,737, and expenditure amounting to £24,062, leaving a gross profit of £17,676. After providing for interest, sinking fund, &c., the net profit amounts to £1,941.

Blackpool.—The receipts on the Corporation tramways during the past month show an increase of £1,328 on last year. From April 1st to July 19th the receipts were £29,707, an increase of £2,773 on 1916. The Corporation has now taken over the line between South Shore station and the borough boundary at Squire's Gate, formerly leased to the Blackpool, St. Anne's, and Lytham Tramway Co., but the latter retains running powers.

Chester.—The gross profit on the tramways undertaking for the past year amounted to £5,820, as compared with £5,241 for the previous year.

Continental.—SWISS RAILWAY ELECTRIFICATION.—The electrification of the Swiss Federal railways, which has been advocated for 15 years, is now occupying the serious consideration of the Government, which has created a special department attached to the Direction of the Swiss Federal railways to consider offers of material and equipment for the work. The question of electrification has become acute during the progress of the war, with the serious shortage of coal; the coal imports for the first three quarters of 1916 represented only about half the quantity imported in the immediate preceding years, while the cost was considerably increased. The Federal Railways form the main portion of the Swiss Railway system, and their electrification is simplified by the great store of undeveloped water-power. The time necessary for carrying electrical improvements into effect will depend upon varying conditions, such as the duration of the war, the condition of the money market, and the development of the needs of Swiss industries and transportation companies. The average demand will amount to about 220,000 H.P., and the maximum load to 550,000 H.P.

The total Swiss railway system, Federal and other, amounts to 3,216 miles, of which 1,700 miles are Federal and 1,516 miles are owned by corporations. Of the private lines, 622 miles are already electrified, but only about 50 miles narrow and other gauge of the Federal railways are operated by electricity. Looking to further electrification, the Federal railways have already acquired numerous water properties in the valleys of the Reuss, Leventina, Rhone, and in the Trient, Canton Valais, and elsewhere. In all, 10 hydro-electric plants are projected, with 500,000 H.P. capacity. Two of these, the Amsteg and Ritom works, supply the Gothard Railway from Lucerne to Chiasso.

The first important Federal standard gauge line to be electrified is the Erstfeld-Bellinzona branch of the Gothard Railway on the Lucerne-Chiasso-Milan line. This line was acquired by the Swiss Federal Railways in 1909, and is 68 miles in length, with 28 per cent. of tunnels and a grade of 2.5 to 2.7 per cent. for 25 miles; it was selected for experiment because of its enormous traffic with Italy, which caused a heavy consumption of coal with resulting smoke in the tunnels. The electrification is expected to be finished in three to five years; the line is being constructed on the same system as that of the private company, Berne-Loetschberg-Simplon. In 1911 the Erstfeld-Bellinzona line had a traffic requiring 19,000 H.P. a day; experts foresee a certain increase to 21,000 H.P., and a probable increase to 26,000 H.P.; therefore, in order to meet all emergencies, a limit of 60,000 H.P. is being planned for.

The Commission has decided to install five turbines of 8,000 H.P. instead of three turbines of 13,000 H.P. each. The works at Amsteg develop 26,000 H.P. and at Ritom 32,000 H.P. from the Ritom Lake; for this construction 1,600 yards of pipe line is necessary. Another series of plants developing 70,000 H.P. is contemplated for Eastern and Central Switzerland. The cost of electrification of the Erstfeld-Bellinzona line is estimated at £1,600,000, and the cost of electrifying the entire Federal Railway system is estimated, roughly, at £40,000,000.—*U.S. Commerce Reports*.

Halifax.—WAGES.—The Corporation has agreed to submit to arbitration a demand by the employees for an advance of 12s. per week above pre-war wages. The Corporation granted 8s. per week, which the men do not consider sufficient.

Keighley.—WAGES AWARD.—The award of the arbitrator in the tramway workers' application for higher pay, is that there be no alteration in the minimum rates, but that males of 21 and upwards should have war bonus increased from 5s. to 6s. per week, and those under 21 shall have bonus of 3s. per week. Female employees of 18 years and upwards are to have 3s. 6d. bonus, and those under that age 2s. These rates will operate as from the first pay day after June 30th.

Leeds.—WOMEN INSPECTORS.—In regard to the proposed appointment of women inspectors, the Tramways Committee, after hearing the views of a deputation of workers, unanimously passed the following resolution for submission to the Tramway Workers' Union:—"That the Committee, having carefully considered the matter, resolve that the Union be informed that there is no intention that the females to be appointed shall have any control over the motormen; that the male inspectors shall continue to act as heretofore; and that the Committee, being quite convinced of the necessity of some increase of inspection and supervision, both in the interests of the public and of the female employees, do not consider there is any reason to vary their resolution of June 18th." This means that the Committee will proceed, subject to the City Council's approval, with the appointment of six female inspectors, who will be selected from amongst the women who were the first conductresses. Their duties will be confined to the inspection of tickets and supervision of the conductors, who are almost all females.

TRAMWAY AND RAILWAY NOTES.

Barking.—The lease of the section of the tramways between the Broadway and the Boundary Bridge to the East Ham Council has been renewed by the U.D.C. for three years, at an annual rental of £450.

Leicester.—FARE REVISION.—To meet an anticipated increased expenditure of £22,000 on the tramways during the present year as compared with 1916, the fares are to be revised and all free passes are to be withdrawn, except to blind and crippled persons and wounded soldiers. A site for a building for converting plant has been purchased on the north side of East Park Road, for £200. The estimated cost of the building is £1,580.

London.—L.C.C.—The Highways Department has settled 685 claims against the Council in respect of accidents arising in connection with the working of the tramways, at a cost of about £6,795. In 20 other cases actions were brought against the Council; in 12 of these a verdict against the Council was given, and sums amounting to £603 and costs had to be paid; six actions resulted in the Council's favour, and two were withdrawn. The Committee has approved the settlement for £461 of claims made by the Council in respect of damage to tramways property, and has also received £3,272 from H.M. Government in respect of the repair of damage to tramways property.

The L.C.C. Highways Committee recommends that its chairman and vice-chairman, or in the absence of either, Mr. W. J. Squires, attend the business meeting of the Municipal Tramways Association at Blackpool on September 20th and 21st, which will replace the usual annual conference.

Wolverhampton.—YEAR'S WORKING.—The gross profit on the tramways for the year ending March 31st, 1917, was £26,180; deducting interest and repayment of loans, the net profit was £12,541, from which £6,580 is to be appropriated in aid of the rates. Owing to the impossibility of obtaining labour and material, a good deal of maintenance and repair work is in arrear. There is now £10,660 in hand to meet the cost of this suspended work. During the year 1,162,269 car-miles were worked and 14,913,789 passengers carried, as against 13,296,146 passengers in 1915-16. The sum of £56,645 stands to the credit of the reserve and renewals fund.

York.—YEAR'S WORKING.—The annual report of the Corporation tramways for the year ended March 31st last shows total receipts amounting to £40,197; expenditure, £30,938; and a gross profit of £9,268. After providing interest on capital and contribution to sinking fund, &c., there was a deficit on the year's working of £964, as compared with a surplus of £1,792 for 1915-16. The car-mileage was 826,283 and the electric bus-mileage 76,993, while the car receipts were 10'9d. and the bus receipts 7'98d. per mile run.

TELEGRAPH AND TELEPHONE NOTES.

Argentina.—The Municipal Commissioners of Buenos Aires have received an application for a concession for an automatic telephone service in the city, from a Mr. Alex. Schwimmer, representing three strong financial houses, whose names and nationality are being kept secret. Mr. Schwimmer states that a capital of \$25,000,000 m/n. will be available from this source whenever it is required.

A similar, but independent, application has been presented to the Municipal Commission by a company styled "La Positiva."—*Review of the River Plate.*

Brazil.—The Government proposes to erect a very powerful wireless station near the mouth of the Amazon. It will be in direct communication with the Sayville station, New York.

Round the World in 16½ Minutes.—The *New York Times* recently dispatched a telegram to itself round the world; the circuit, 28,613 miles in length, was traversed in 16½ minutes, the shortest time on record for an ordinary message.

Spain.—A draft scheme has been presented by the Director-General of Communications to the Government of a project to reform the national telephone system. Premising that Spain possesses only one telephone for every 571 of her town populations, while France has one for every 143, England one for every 63, Germany one for every 13, and Denmark one for every 23; and that Spain has one rural office for every 15,000 inhabitants, while Germany has one for every 1,500, Denmark one for every 1,350, France one for every 2,321, and England one for every 3,140 inhabitants, the draft scheme proposes to establish telephone offices in the greater number of town and rural communities hitherto unprovided with these services, which now only exist in 108 of the principal cities and towns. To carry out this project, it is proposed to impose on the provincial Deputations the obligation to contribute up to 20 per cent. of the cost of their respective networks, and call into being a National Telephone Institution with power to raise a fund of 60,000,000 pesetas, the estimated amount which the 40 provincial networks would cost, including the purchase of existing private rural lines. The fund created would be liquidated by the receipts from the telephone service. The scheme has, it is said, been well received in Spain.—*Industria e Invenções.*

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—SYDNEY.—August 22nd. N.S.W. Government Railways and Tramways. Thirty-six induction motors (Specification No. 488). September 19th.—One 225-H.P. synchronous motor (Specification No. 489). Particulars from Electrical Engineer's Office, 61, Hunter Street, Sydney.

MELBOURNE.—October 10th. Department of the Navy. Pumping plant and equipment for the Commonwealth Naval Dockyard, Cockatoo Island, Sydney. Specifications from the Director of Navy Contracts, Melbourne.

Blackburn.—August 4th. Steam coal for 12 months for the Electricity Department. Mr. P. P. Wheelwright, Engineer and Manager.

Keighley.—August 3rd. 12,000 tons best slack and small slack coal for Electricity Department. Six-monthly and twelve-monthly period. Mr. H. Webber, Boro' Electrical Engineer.

London.—BERMONDSEY.—Sept. 7th. B.C. 500-KW. rotary converter. See "Official Notices" to-day.

H.M. OFFICE OF WORKS.—August 7th. Insulated lamps and lampholders. See "Official Notices" to-day.

Warrington.—August 14th. 7,500 tons of slack coal for the Electricity and Tramways Committee during six months from September 10th, 1917, and alternatively for part or whole of 15,000 tons of slack during 12 months. Mr. F. V. L. Mathias, Borough Electrical and Tramways Engineer, Howley, Warrington.

CLOSED.

Barrow.—T.C. Electricity Committee:—

Steam and feed pipes.—Aiton & Co., £115.
Ironwork for boiler foundations.—Stirling Boiler Co., £242.
Motor for chain-grate stoker (exclusive of starting gear).—Electromotors, Ltd., £59 18s.
Sub-station H.T. switchgear.—British Thomson-Houston Co., £342.
Boiler and economiser foundations.—J. Simmons, £319.
Brickwork setting.—Bradley & Lonsdale, £415.
Sub-station foundations.—J. Simmons, £57.
L.T. switchgear.—British Thomson-Houston Co., Ltd., £367.
Renewal of contract for Featherstone washed peas for 12 months at same price as last contract.—O. M. Huarison.

Bath.—T.C. Stoker and fan for boiler at the electricity works: Underfeed Stoker Co., Ltd., £491.

Derby.—T.C. Accepted tenders:—

Two miles of overhead wires for the tramways.—B.I. & Helshy Cables, Ltd., £290.
Coal for the electricity works.—Mr. D. McCarthy.

Gloucester.—The Electricity and Light Railway Committee has accepted the tender of the D.P. Battery Co. for a new battery at the electricity works, with glass cells, at a cost of £933, subject to a satisfactory price being obtained for the old lead cells.

Leicester.—T.C. Accepted tenders:—

Siemens Bros., Ltd.—1,000-kw. rotary converter, £3,100; switchgear, £410.
Glover & Co., Ltd.—Cables, £3,425.

Leyton.—U.D.C. Tudor Accumulator Co.: Maintenance of accumulators at the electricity works.

London.—L.C.C.—The Highways Committee has purchased 42,335 tons of coal and 25 tons of coke for use at the Greenwich generating station, at a cost of about £73,000, during the quarter ended June 30th, 1917.

Supply of tramway fittings, equipment, &c., 1917-18. Accepted tenders:—

Class T 14, items 3 and 4. Baking and air-drying insulating varnish.—Pinchin, Johnson & Co., Ltd.
Class T 15, items 1 and 2. Finishing insulating varnish.—Jensen and Nicholson, Ltd.
Transfer of two rotary converters from Greenwich generating station to Woolwich, £265.—Dick, Kerr & Co., Ltd.
100 driving-wheel axle forgings for tramears, £387 10s.—W. Beardmore and Co., Ltd.
Vulcanised-bitumen cable, £755.—Callender's Cable & Construction Co., Ltd.

STEPNEY.—Electricity Committee. Accepted tenders:—

1,200 tons of Coleorton small nuts.—J. H. Beattie & Co., 27s. 6d. per ton.
2,000 tons of New Hucknall Deep 1½-in. slack.—A. Blackman & Co., 23s. 2d. per ton.

Manchester.—Electricity Committee. Accepted tenders:—
High and low-pressure steam and feed pipework.—Stewart & Lloyds, Ltd.

Stores for 12 months:—

Boiler tubes.—British Mannesmann Tube Co.
Carbon brushes.—Le Carbone, Ltd.; Morgan Crucible Co., Ltd.
Dynamo brushes.—Johnson, Clapham & Morris, Ltd.
Electric wires and cables.—Andrew & Co.; B.I. & Helshy Cables, Ltd.; St. Helens Cable & Rubber Co., Ltd.; C. Macintosh & Co., Ltd.
Special turbine oil.—C. C. Wakefield & Co. (six months).
Air-cooled transformers.—British Electric Transformer Co., Ltd.
Stoker links.—Babcock & Wilcox, Ltd. (three months).

Salford.—T.C. Accepted tenders:—

Mann's Patent Steam Cart & Wagon Co., Ltd.—Five-ton steam lifting wagon for the Electricity Department, £860.
Doulton & Co., Ltd.—Stoneware conduits, schedule of prices approximately £164.

Walthamstow.—U.D.C. Accepted tenders :—

Foster Construction Co., Ltd.—Extension to boiler house at the generating station, £775.
 Fleuning, Birkby & Goodall.—Line material for tramways overhead equipment.
 Frederick Smith & Co.—Trolley wire for same.
 London & Lancashire Fire & General Assurance Association, Ltd.—Insurance of the first Brush Ljungstrom set at an annual premium of £60, less 15 per cent., to cover breakdowns to the extent of £1,250.
 W. T. Henley's Telegraph Works Co., Ltd.—Cables.
 British Thomson-Houston Co., Ltd.—Switchgear.
 British Electrical Transformer Co.—Transformer.

Waterford.—Corporation. Recommended tender : Messrs. Keating & Gaule, installation of an electrical system in the fire station.

Wolverhampton.—T.C. Accepted tenders :—

Drake's, Ltd.—Duplicate drag link conveyor at the electricity works, £350.
 Staveley Coal & Iron Co., Ltd.—Cast-iron pipes, £750.
 Brush Electrical Engineering Co.—Two 300-kw. transformers, £238 each.
 Lea Recorder Co.—Two recorders for measuring steam consumption, £85 10s. each.

NOTES.**National Insurance Acts.—The Umpire has decided**

that contributions are payable in respect of :—
 2,358 X. Gatemen employed in connection with insured trades, and engaged wholly or mainly by way of manual labour—*e.g.*, in such work as opening and shutting gates, taking in and handing out checks, operating a weighing machine, keeping the yard tidy, carrying messages.

This decision modifies decision B, 50 (*Board of Trade Journal* of June 6th, 1912), and subsequent decisions relating to gatemen in so far as they may conflict.

In pursuance of the Unemployment Insurance (Umpire) Regulations, 1912, notice of an application has been given for decision as to whether contributions are payable or not for the following :—

499 X. Workmen described as valvemen, hydraulic main men, tar main men, tar pit men, employed in connection with coke ovens.

Any representation may be made to the Registrar, Office of the Umpire, 47, Victoria Street, London, S.W., 1, on or before August 9th. A decision will be given on or after August 13th.

Russian Electricity Prices : Application for Increase.—

The Russian League of Electric Stations for Public Use has applied to the Ministry of Trade and Industry with a request respecting an increase in the price of electricity. The League explains that the present valuation of electricity will lead to the stoppage of electric concerns, which would, of course, reflect disastrously on the supply of power to industries working for the national defence, and introduce considerable disorganisation into the life of many towns. The only issue from such a position appears to be the granting of a legal order increasing the tariffs for electrical energy. At the same time, the League proposes a strict limitation of the profits of electrical concerns on the following basis :—The net profit of private electrical concerns for public use to be limited to 8 per cent. Half of the profits over 8 to 10 per cent. to be made over to district institutions, and all profits over 10 per cent. to go to the Treasury. The increases in the tariff proposed by the League are as follows :—Tariffs of 5 copecks and under inclusive, to 200 per cent.; over 5 c. and up to 10 c., 150 per cent.; from 10 c. to 15 c., 125 per cent.; from 15 c. to 20 c., 100 per cent.; from 20 c. to 30 c., 75 per cent.; and over 30 c., 50 per cent. At the same time, however, the tariffs shall in no case exceed 60 copecks per kw.-hour (1 copeck = $\frac{1}{4}$ d.). In view of the importance of the request, as it affects the interests of the whole population, a special conference has been called of the Electrical Current Committee to consider the question.

The L.C.C. and Munitions.—Reports recently presented

to the Education Committee of the Council give a short statement of the work accomplished during the past two years. Very soon after the formation of the Ministry of Munitions, efforts were made to utilise the educational resources of the London Technical Institutes to the fullest extent on munitions. As the demand for training students did not tax the whole energies of the Council's organisation, it was decided to detail skilled staff from other branches of the service into certain institutions which could take up the manufacture of gauges, this line being urgently called for at the time by the Ministry of Munitions, and it has been possible to develop this work to a remarkable degree by the utilisation of these skilled workers, with comparatively little interference with the normal activities in technical education. With the special object of avoiding interference with ordinary educational work, the training centres for munitions students were placed at Brixton and Shore-ditch, where engineering instruction is not ordinarily given, and these centres were equipped with machines drawn from handicraft centres, and with more modern tools supplied by the Ministry of Munitions.

During the past eight months efforts have been concentrated on obtaining the most suitable and up-to-date machinery, and, as a result, the equipment of the centres has been brought up to a really high level. An effort has been made to secure such equipment as will not only meet the immediate urgent demand for the output of munitions, but will be of real value afterwards in technical training. It is now very clear that much more attention

must be devoted after the war to instruction in workshop processes and production, and skilled staff suitably qualified will be necessary for this purpose. Fortunately, the line of work which has been successfully developed gauge-making, &c., has placed not only an adequate, but a more than adequate, staff within reach in the Council's service to enable each centre marked out for engineering training to be made a focus of educational activity far beyond anything previously possible.

The value of the machines and equipment provided is approximately £7,000. It is claimed that, jointly, the manufacturing centres are comparable in machine tool equipment with any technical college in the kingdom, so that, given adequate staffing, very great progress in machine shop training will be possible.

The total staff now engaged in these shops on the manufacture of munitions is 205. The output of gauges during the first year's work was 18,091; during the second year's work, up to June 30th, 1917, the output was 30,169; a total of 48,560 in two years. In addition, a quantity of work of less importance has been undertaken. The staff, as a whole, have been working from 64 to 71 hours per week for the past year, and the work done reflects the highest credit on those who have participated.

During the two years ended June 30th, 1917, 8,089 students have been under training as munition workers in the various centres, of whom 6,088 have been certificated on satisfactorily completing their training; 5,751 of these are known to have obtained employment on work of national importance. The total staff engaged on training numbers 95.

Legal.—In the City of London Court, on July 31st, before His Honour Judge Rentoul, K.C., an action was brought by Mrs. Annie Jeffery, of Henley, to recover £1 10s. against Messrs. William Lund & Sons, jewellers, 56, Cornhill, E.C., for damage caused to a musquash seal coat through the defendants' electric heater not being sufficiently guarded. Plaintiff said that she went to the defendants' shop to buy a tortoise-shell bag frame, and was asked to look at one in the window. While she was doing that, her coat was burned by the electric heater, which was on the floor underneath the window. The burned piece of fur had been replaced at an expense of 30s. She bought the coat for £35, and while there had been a great difficulty in matching the fur, a casual observer would not detect the repair. Defendants said that the plaintiff's statement was quite accurate. She must have been short-sighted, and tip-toed to look into the window. Before he could say, "Don't go too near the radiator," she burnt her coat. Of course, they were sorry, but they could not accept the onus for the damage done. The radiator was wired in a proper manner. Judge Rentoul, K.C., was afraid it was not, or the plaintiff's coat would not have been burned. As the defendants invited people to go into their shop to buy goods, they must keep it in a safe condition, so that there would not be anything in the nature of what lawyers called a trap. There must not be anything that would burn a lady customer's coat. If the plaintiff was short-sighted—and she said she was not—it made no difference. It might be that the electricians were in fault in not better guarding the heater. Plaintiff's demand was very modest. If electric heaters were put into business premises, the owners did so at their own peril. The customers must be kept safe. Judgment for the plaintiff.

Electricity on Board Ship.—In a report on marine hygiene, the Assistant Medical Officer of Health for Liverpool insists upon the general introduction of lighting and ventilating by means of electricity, points that can now be dealt with by the standardisation of construction. Incidentally, he mentions that on very large liners one method which has had good results, and allows of several changes of air per hour in the cabins, consists in using four large fans, 5 ft. in diameter, driven by electric motors. These drive the fresh air from the upper deck into shafts suitably distributed. The air is sufficiently heated on entering, by means of steam coils, to allow the temperature of 60° F. to be maintained in the terminal distributing shafts. He proceeds to suggest that the exhaust fans for extracting the vitiated air from the cabins should be of smaller capacity than the blowing fans, to enable a slight internal pressure to be always maintained. It is, he says, very desirable that the lighting of living quarters should be more carefully arranged, and electric lighting has made a great improvement in the larger vessels.

The Supply of Platinum.—In 1916 the crude platinum mined in Colombia, estimated at 25,000 oz., was refined in the United States, and reports received from U.S. refiners show that 28,088 oz. of metals of the platinum group was recovered by them from all sources, foreign and domestic, of which 24,518 oz. was platinum (1 oz. troy = 31.1 gm.).

It is known that the Colombian deposits will be more extensively developed during 1917 than ever before, and it is estimated that at least 30,000 oz. of crude platinum, containing 85 per cent. metal, will be derived from that source. It is hoped that in 1917 deposits in the United States will yield more platinum than heretofore, that platinum derived from all sources other than foreign crude will exceed 7,000 oz., and that the production of crude platinum will be at least 10 per cent. greater than in 1916.

The Russian situation is very difficult, but it is known that there are considerable stocks of crude platinum held in Russia which are available to the Allied Governments. It is believed that the production from Russia in 1917 will be considerably increased, perhaps equalling the 1915 output (124,000 troy oz.).

The available supply of platinum in the United States appears to be adequate to meet immediate needs.—*Metallurgical and Chemical Engineering.*

Electrolytic Zinc.—A pamphlet published by the United States Geological Survey, relating to the output of zinc in the United States during 1916, contains a paragraph on the production of electrolytic zinc. The total capacity at the end of 1916 was not as great as the original estimate of the Survey, and instead of 60,000 tons, the actual rate of output was 40,000 tons per year. This fact was due to the delay in completing several plants. It is stated that when the plants now under construction are at work, the yearly capacity will be 85,000 tons. The actual output of electrolytic zinc during 1916 was 12,916 short tons, of which 1,800 tons was produced by refining prime western spelter, 887 tons was refined from scrap and dross, and 10,229 tons was produced direct from ores by leaching and electro-deposition. The total production of zinc in the United States during 1916 was 667,156 short tons. A table gives particulars of 11 electrolytic zinc plants in the United States. In writing of electrolytic zinc in North America, it is desirable to mention also that one of the most important plants is at Trail, British Columbia.—*Mining Magazine*.

The Engineers' Ballot on Dilution.—It will hardly be possible for the Ministry of Munitions to proceed with their scheme for enforcing dilution on private work in face of the engineers' ballot, which gave 45,000 votes against and only 8,000 for it on a voting membership of about 200,000. It may be expected that the Government will drop this feature of the Munitions Amendment Bill, and concentrate on carrying out dilution on private work, wherever possible, by agreement. The remaining provisions of the Bill, many of which anticipated specific recommendations by the Industrial Unrest Commissioners, will probably be passed into law without further delay.—*Times*.

U.D. Councils' Association and Electricity Supply.—At the quarterly meeting of the Executive of the Urban District Councils' Association, consideration was given to the evidence to be submitted to the Electric Power Supply Committee, and the following resolution was passed:—

That a Sub-Committee be appointed to consider the evidence to be furnished on behalf of the Association, it being the view of the Executive Council (1) that the future electricity supply of the country must be looked at from a national and not from a parochial point of view, the first consideration being a supply of cheap electricity; (2) that it is essential that any scheme for the construction of large stations should secure a satisfactory supply of energy in bulk on fair terms to any local authority authorised to supply and desiring the same; (3) that the profit of any bulk supply undertaking ought to ensure for the benefit of the community; and (4) that if any existing undertakings are taken over they should be acquired on equitable terms.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W.

Orders for the week, by Lieut.-Colonel C. B. Clay, V.D., commanding:—*Saturday, August 4th, to Sunday, August 12th.*—Camp at Esher. During this period the Headquarters at Balderton Street will be closed, and will be removed to the Headquarters at the Camp, Claremont Park, Esher.

Musketry.—The range at Belvedere Road will be open on Tuesday, Wednesday and Thursday, August 7th, 8th and 9th, respectively, from 5.30 to 7.0.

Armlets.—The new issue armlets can now be obtained at Headquarters, and every enrolled man must obtain one without delay, and all old (red) armlets must be returned to the Orderly Room.

(By order) MACLEOD YEARSLEY, Company Commander and Adjutant.

B. of T. Committee on Electricity Supply.—The General Purposes Committee of the L.C.C. has recommended that Standing Order No. 177 be suspended so far as may be necessary to enable the confidential report of July 14th, 1914, by the Comptroller of the Council, the chief engineer, and Mr. C. H. Merz, on the question of London electricity supply, to be submitted in evidence before the Electric Power Supply Committee of the Board of Trade.

Zirconia as a Refractory Material.—The *Transactions* of the Ceramic Society, says *Nature*, contain an interesting article by Mr. J. A. Audley on this subject. The melting point of raw zirconia is in the neighbourhood of 2,000° C., that of the purified material being considerably higher. It can be both melted and volatilised in the electric furnace. It is a "neutral" substance of the same type as alumina, and is said to have a high resistance to the fluxing action of both acid and basic slags. Its heat conductivity is remarkably low, and its coefficient of expansion on heating is nearly as low as that of quartz glass, both of which are very valuable properties. It resists the action of fused cyanides and alkalis.

As a lining for electric arc furnaces the natural product is good enough, its high melting point, low thermal conductivity, and small coefficient of expansion making it particularly suitable for this purpose. Now that it is obtainable at comparatively reasonable prices, it can be used for the manufacture of refractory bricks.

Educational.—CITY AND GUILDS OF LONDON INSTITUTE.—The Department of Technology has issued the programme for 1917-18, containing the regulations for the conduct of classes and examinations of candidates in technological subjects, &c. It is announced that in the event of the continuance of war, it will not be possible to hold the examinations in Grade I and Final in Electrical Installation Work in 1918, and modifications may become necessary in other respects.

Appointment Vacant.—Assistant constructional engineer for the Birmingham Electric Supply Department. See our advertising pages to-day.

Bequest for Research.—The late Sir Charles Holcroft, Bart., ironmaster and colliery proprietor, bequeathed to Birmingham University £5,000 to establish a "Charles Holcroft Research Fund," the income to be applied to promote and encourage research work in Chemistry, Physics, Engineering, Mining, Metallurgy, &c.

Fatality.—The *Times* states that while chasing a crab on Southend Pier, on Tuesday, a boy, aged 11, stepped on the live rail of the electric tramway, and was killed.

Electrical Import Restrictions.—The Import Restrictions Department of the Board of Trade have under consideration, in consultation with the London Chamber of Commerce, Oxford Court, Cannon Street, London, E.C. 4, the granting of a concession allowing the restricted importation of the following goods:—(a) Electric dry cells; (b) arc lamp carbons; (c) searchlight carbons; (d) battery carbons. Firms who were importing these goods last year should communicate with the London Chamber of Commerce, asking for particulars as to the steps which should be taken to obtain licences.

The Ministry of Munitions and Gas.—In view of the paramount importance of meeting the increasing need for by-products obtained from the carbonisation of coal at gasworks, the Minister of Munitions wishes to impress upon those possessing gas-burning appliances the desirability of using gas in preference to any other means of obtaining light, heat, or power. At present an increased supply of gas can be provided without difficulty, inasmuch as during the summer months gas undertakings generally are in a position to manufacture in excess of the ordinary requirements of consumers.—*Daily Telegraph*.

It will be observed that this instruction is addressed specifically to "those possessing gas-burning appliances."

Electricity from Irish Peat.—It is announced that Mr. Keating, M.P., secretary of the Industries Committee of the Irish Parliamentary Party, has received an assurance from the Prime Minister that the representation as to adding to the Irish Committee on Peat a member with electrical experience will receive attention. The name suggested is that of Dr. J. F. Crowley, the Irish representative on the Board of Trade Committee which is investigating the sources of electrical power in the United Kingdom. It is claimed for him that he is possibly the only Irishman who has had extended practical experience of research on a large scale in relation to electrical engineering. An experiment in the production of electricity from peat is now being made, and it is held by expert authorities that in that direction mainly lies the best and most serviceable use of the vast reserve of peat stored in the Irish bogs.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—Hull Corporation tramways manager reports that Mr. J. CLAPPISON, a member of the staff, has effected an improvement in the soldering irons used by the department. On the manager's recommendation, the Corporation has granted him an award of two guineas.

At the meeting of the Heston and Isleworth U.D.C., the Electricity Committee reported that the exemption of Mr. P. RYEROFT, the electrical engineer, had been withdrawn by the Military. It was granted him as a whole-time official, but for two months he had been engaged partly in the Controller of Mines Department, and on that ground the certificate had been withdrawn. He could, however, the Munition Area Dilution Officer stated, obtain a protection card, Army Form W 3,476b, and the Committee recommended that this be done. A number of members objected to the recommendation. If the engineer was not necessary as a whole-time official he ought to be in the Army, being in Class A. Mr. Hales said that Mr. Ryeroft early in the war declared his willingness to enlist. Let him do so now. Mr. Lobjoit said they had nothing to do with Mr. Ryeroft's wishes. They had only to consider him as the responsible head of a valuable undertaking, where nearly all the rest of the staff had joined up. If a breakdown occurred there was no one who could set things right. Although with the Controller of Mines daily, the engineer could be got at at any moment, and the arrangement was that he was to be spared if absolutely required. The Committee's recommendation was agreed to.

Brighton Tramways Committee has increased the salary of Mr. MARSH, engineer and manager, from £400 to £500 a year, subject to the condition that the amount of the increase shall, during the time that he is acting as an Assistant Director of Shipyard Labour, be reduced by an amount equivalent to the pecuniary benefit derived by him from the allowance for expenses to be made to him by the Government.

The Bolton Electricity Committee has received the resignation of Mr. ROBERT BAKER, superintendent of the fittings department, and passed a resolution expressing high appreciation of his services, and regretting that, owing to ill-health,

he deemed it necessary to retire. Mr. Baker is to continue in a consultative capacity at a salary of £62 10s.

Mr. F. FRENCH, deputy borough electrical engineer of Bridlington, has been appointed O.C. of Vol. R.E. (Signal) Section at Bridlington.

The Derby Electricity Committee has appointed Mr. G. H. LAKE chief assistant engineer, at £250 per annum.

The Highways Committee of the L.C.C. reports that, in connection with the reorganisation of the Council's tramways department, applications were invited for the positions of rolling stock engineer and permanent way engineer at salaries of £1,000, rising to £1,200, and £800, rising to £1,000 respectively, no limit of age being prescribed. In response to the invitations, 32 applications were received for the position of rolling stock engineer, and 39 for the other appointment. After examining the applications, &c., the Committee does not feel justified in recommending the appointment of any candidate to the positions as advertised, and under the circumstances recommends:—

That Mr. W. E. IRELAND, rolling stock superintendent in the tramways department, act temporarily as rolling stock engineer, and that while so acting he be granted, in addition to his salary (£525 a year), a special allowance of £225 a year; that Mr. H. S. MAY, assistant rolling stock superintendent in the tramways department, discharge temporarily the duties of rolling stock superintendent in the rolling stock branch as reorganised, and that while discharging these duties he be granted, in addition to his salary (£325 a year), a special allowance of £75 a year; that Mr. G. W. KNECHT, superintendent of the central car depot, occupy temporarily the position similarly designated in the rolling stock branch as reorganised, and that while occupying this position he be granted, in addition to his salary (£300 a year), a special allowance of £100 a year; that Mr. J. B. WELLING, permanent way engineer in the tramways department, occupy temporarily the position of head of the permanent way branch as reorganised, and that while occupying this position he be granted, in addition to his salary (£600 a year), a special allowance of £150 a year; that Mr. J. R. WIGNAL, technical assistant in the tramways department, act temporarily as a technical assistant to the permanent way engineer, and that while so acting Mr. Wignal be granted, in addition to his salary (£340 a year), a special allowance of £100 a year; and that, until further order, Mr. W. P. FARGUHLARSON, general assistant, do act in the position of chief clerk in the tramways department.

General.—Mr. A. P. TROTTER, Electrical Adviser to the Board of Trade, after 21 years' Government service, is returning to professional practice as a consulting engineer. He is entering into partnership, as from October 1st next, with Messrs. Hancock & Dykes, under the style of Hancock, Dykes & Trotter. The offices of the firm will be at 11, Victoria Street, London, S.W.1. For the next six weeks Mr. Trotter's address will be "Coates Farm, Fittleworth, Sussex." Mr. Trotter, who is a member of the three leading engineering institutions, and president of the Illuminating Engineering Society, as well as vice-chairman of the National Illumination Committee of Great Britain, and chairman of the Joint Committee on Illuminating Engineering of the Department of Scientific and Industrial Research, was electrical engineer to the Government of Cape Colony from 1896 to 1899, when he became Electrical Adviser to the Board of Trade. His lifelong devotion to the study of illumination problems has placed him in the front rank of authorities on that subject; he was the originator of the dioptric type of glass shade, which at the time, unfortunately, could not be commercially manufactured, but now, in modified forms, is a very popular and highly efficient device, and, besides inventing various photometers and other scientific apparatus, he has made valuable contributions to the literature of light. As custodian of the Board of Trade electrical standards, Mr. Trotter was justly proud of their well-known precision, and the work done in the meter-testing department under his supervision was of the highest order. He was also responsible for the Electricity Supply Regulations of the Board of Trade, and in that capacity bore the brunt of the criticism which Government regulations invariably provoke. He did his utmost to smooth the way of applicants for leave to erect overhead mains, and himself developed the theory and effected valuable improvements in design. Few men in the electrical world possess a more genial personality or are more deservedly popular in the profession than Mr. Trotter, and his many friends will heartily join with us in wishing him every success in his new sphere of labour.

The marriage took place at Blackburn, last week, of Mr. JAS. HEYS, electrical engineer, of Invergordon, where he is engaged with the Admiralty, and Miss Lizzie Bedford, of Blackburn.

Roll of Honour.—Captain C. CECIL ELLISON, West Yorkshire Regiment, eldest son of Mr. C. H. Ellison, telegraph superintendent of the N.E. Railway, was admitted to a base hospital in France on July 24th, suffering from gas-shell poisoning and severe wounds, but he is progressing favourably.

Private J. C. GOLD, formerly in the gutta-percha department of the India-Rubber Co., Silvertown, and Driver G. SPRINGALL, formerly in the general office of the same company, have both been wounded in France.

An evening paper states that Wireless Operator J. H. HOLDENSHAW, R.F.C., has been awarded the D.C.M. for erecting wireless apparatus when it had been shot down by the enemy.

Private E. W. R. CLARKE, Middlesex Regiment, killed in action, was employed by the Ediswan Co., Enfield, N.

Private W. H. PRITCHARD, North Staffs. Regiment, who was engaged at Messrs. Siemens Dynamo Works, at Stafford, is reported killed in action, after being missing.

Corporal R. DAVIES, King's Shropshire L.I., who was an articulated pupil at the Shrewsbury Borough electricity works, has died of wounds received in action at the battle of Loos in September, 1915.

Staff Sergeant-Fitter E. F. HAMMERSLEY, R.C.A., who has fallen in action, was on the staff of the Potteries Electric Traction Co., Stoke-on-Trent.

Gunner P. L. CORE, Howitzer Battery, who has died of wounds received in action, was with Messrs. Williams & Robinson.

Captain W. DOWNEY, Staff D.A.A. of Ordnance, reported missing and believed to have been drowned, was, before the war, connected with the electrical engineering department of the Dublin Corporation.

Gunner G. MOORCROFT, R.F.A., who has had to have both feet amputated, and who is 21 years of age, was employed at the Southport Corporation electricity works.

The death is officially reported of Private J. WRIGHT, of the Loyal North Lancashire Regiment, who was employed in the offices of Messrs. Dick, Kerr, at Preston.

Temporary Lieutenant (acting Captain) R. G. BEER, R.E., who was before the war with the Chelmsford Electric Lighting Corporation, has been mentioned in General G. F. Milne's dispatch for distinguished service with the Salonika Force.

Corporal G. F. EDEN, Royal Marine L.I., who has been killed in action, was an electrician at the Hotel Metropole, Leeds.

Private J. HOWARTH, Durham L.I., who is reported killed, was employed as an electrician at Warrington.

Lieutenant AUSTIN VIVIAN D'ANDRIA, R.E., who has been awarded the Military Cross for gallantry, was an electrical engineer. He was in Constantinople at the outbreak of the war, assisting in the erection of a new works by an English firm.

Corporal E. JACKSON, of the West Riding Regiment, who has been granted the D.C.M., was an electrician at the works of Messrs. R. F. Winder, Leeds. He was awarded the Military Medal four months ago.

Second-Lieutenant A. E. W. BUTLER, Royal Berkshire Regiment, reported killed after being missing for a year, served his apprenticeship with Messrs. Fraser & Chalmers, or Erith, and later was on the staff of Callender's Cable and Construction Co., Ltd.

First-Class Stoker G. DEWELL, who was lost in H.M.S. *Vanguard*, was an employé of Messrs. Johnson & Phillips, Ltd., of Charlton, S.E.

Will.—According to the *Times*, the late Mr. MATTHEW GRAY, of Lessness Park, Abbey Wood, Kent, and of the India-Rubber, &c., Co., of Silvertown, who died intestate, left £37,033.

NEW COMPANIES REGISTERED.

Voltalite, Ltd. (148,069).—Private company. Registered July 24th. Capital, £3,000 in £1 shares. Manufacturers of and dealers in self-generating electric cycle lamps, and other electric, cycle, or engineering appliances, manufacturers, importers, exporters, and shippers of and wholesale and retail dealers in games, toys, cycles, and fancy goods, &c. The subscribers (each with one share) are: H. O. Farrell, 99, Meadow Street, Moss Side, Manchester, electrical engineer; A. Lowe, 388, Manchester Road, Droylsden, cashier. The first directors are: H. O. Farrell and A. Lowe. Registered office: 91, Beverley Street, Moss Side, Manchester.

Enterprise Manufacturing Co., Ltd. (148,059).—Private company. Registered July 24th. Capital, £5,000 in £1 shares (2,500 pref.). Electrical merchants, suppliers on sale or hire of electric lamps and fittings, &c. Agreement with C. H. Roberts and H. Ashdown. The subscribers (each with one share) are: C. H. Roberts, 23, Acacia Road, Norbury, S.W., electrical engineer; H. Ashdown, 16, Landseer Road, Bow, E.3, electrical engineer. The first directors are: C. H. Roberts and H. Ashdown. Registered office: Gun Street Electrical Works, Bishopsgate, E.1.

Wedmore Engineering Co., Ltd. (148,050).—Private company. Registered July 23rd, by Johnson, Weatherall & Sturt, 7, King's Bench Walk, Temple, E.C. Capital, £100 in £1 shares. To acquire (by permission of the Board of Trade) the business of a company of the same name (the books and documents of which are liable to inspection under the Trading with the Enemy Act), and to carry on the business of mechanical and electrical engineers, founders, smiths, &c. No share may, without the consent of the Board of Trade, be held by or on behalf of any (present) enemy, nor may the directors, without such consent, allot or register the transfer of any shares which would cause more than 40 per cent. of the total issued capital, or more than 25 per cent. of the voting power, to be held by or on behalf of foreigners, foreign corporations, or foreign-controlled corporations. The subscribers (each with one share) are: S. G. Beaton, Branscombe, Woodcote Green, Wallington, engineer; G. H. Beaton, 41, James Square, Holland Park, N.W.11, engineer. The first directors are S. G. Beaton and G. H. Beaton. At least three-fourths of the directors, including the chairman, must be British subjects, resident in the United Kingdom. No (present) enemy may be a director or alternate director.

Cosmos Lamp Works, Ltd. (148,045).—Private company. Registered July 23rd, by Jenkins, Baker & Co., 17, Grosvenor House, Old Broad Street, E.C.2. Capital, £50,000 in £1 shares. To acquire (by permission of the Board of Trade) the undertaking of the Brimsdown Lamp Works, Ltd. (the books and documents of which are liable to inspection under the Trading with the Enemy Act), and to carry on the business of manufacturers of and dealers in electrical lamps, fittings, and appliances, &c. The articles of association contain provisions relating to British control, similar to those in the case of the Wedmore Engineering Co., Ltd. (q.v.). The subscribers (each with one share) are: A. Winterbottom, Donwood, Alder Avenue, New Malden, Surrey, accountant; F. E. Clarke, Bourne, Fwell Road, Surbiton, Surrey, accountant. The first directors are: N. B. Dickson, F. A. Lang, W. W. Blunt, G. Layton, and J. H. Tearle. Registered office: Westinghouse Building, Norfolk Street, W.C.2.

CITY NOTES.

**Pernambuco
Tramways
and Power
Co., Ltd.**

Mr. F. HOLT, presiding at the annual meeting recently, said that the company had a net increase of 10 per cent. in earnings, notwithstanding that the gas works were under reconstruction, that the tramways were being converted to electrical working, and that prices of coal and all materials were very high. During the year the exchange had been very much against them, but their result was not altogether unsatisfactory on the whole. The exchange was now better, and earnings continued to show steady improvement. If nothing unforeseen happened this year, they would be able to establish the renewal fund and, possibly, go a step further, but they must proceed cautiously in these difficult times. They had only touched the fringe of the electric light and power supply possibilities. During next year they hoped for good results from the development of that department of the business.

**Indo-European
Telegraph
Co., Ltd.**

The company's through telegraph service continued interrupted during 1916. Telegraphic receipts were limited to traffic traversing the eastern sections of the company's system. The new arrangement between the company, the Indo-European Telegraph Department, and the Eastern Telegraph Co., under which there would be secured to the company a sufficient sum, after payment of all expenses, to provide a dividend of 7 per cent. on the share capital, came into operation on August 1st, 1916. It would lie with the directors to recommend any additional dividend by drawing on the equalisation of dividends fund, but this was not called for in respect of 1916. The revenue from message account and other sources was £162,274, against £204,190 for 1915; a decrease of £41,916. The expenses on commercial and general account were £55,519, and on maintenance account £19,810, making a total of £75,329, a decrease of £6,889. After deduction of income-tax, and adding the amount brought forward, £80,073 is available, and out of this £40,000 is put to investment fluctuations, the interim dividend requires £10,625, the final dividend of 22s. 6d. per share (making 7 per cent. for the year) absorbs £19,125, and £10,323 is to be carried forward. With the final dividend mentioned, a distribution of 30s. per share was paid out of interest received, making a total for the year 1916 of £3 5s. per share, free of income-tax.

**London United
Tramways,
Ltd.**

On July 25th, at an adjourned meeting of the first mortgage debenture stockholders, Mr. M. W. MATTINSON, chairman of the Committee of Debenture-Holders, made a full statement concerning the Committee's work. In addition to investigating the present position, they had tried to look farther ahead and to estimate the position of the company in the period after the war. Many things had been investigated, and they required the assistance of a person skilled in tramway construction and running to give his professional opinion to aid them. Such advice should be obtained without any avoidable delay. The Committee had been considering whether a solution of the future of the company, and their interest as debenture-holders therein, might not be found in some permanent arrangement with the Underground Co. or its associated companies. That was the only possible solution, but it was one first to be explored and considered. They had hoped to secure election to the board of two gentlemen nominated by the debenture-holders, but the board declined the request, although renewing their assurance to give every information that the Committee required. The Committee recommended that the bond-holders should authorise them to incur all necessary expense in obtaining professional and other advice. They would do their best to obtain expert assistance and such report as might be necessary upon the position and prospects of the system. The Committee was not a committee of investigation, and they did not propose to make any inquisition as to where the responsibility of the past lay. They were a committee of reconstruction, and their mission would be limited, as far as possible, to the rehabilitation of the company. A resolution was passed by the meeting authorising the employment of competent expert assistance. LORD REVELSTOKE, who presided, said that an opportunity might be taken to convey to the board an expression of the debenture-holders' opinion, inviting them to elect two gentlemen as representatives of the debenture-stockholders to join the board.

**Yorkshire
Electric
Power Co.,**

Satisfactory progress is reported for the half-year ended June. The revenue has increased and, notwithstanding the higher cost of coal and labour, the net profit is larger. The net profit, after payment of bank and other interest, for three June half-years has been: 1917, £17,617; 1916, £13,550; 1915, £9,873. The half-yearly dividend on the 6 per cent. cum. pref. shares is to be paid on August 1st, but in view of the financial conditions arising out of the war payment of a dividend on the ordinary shares is deferred until the accounts are made up for the year. The new 6,000-kw. turbo-alternator will shortly be running on load. In consequence of increased demands for current, it

has been found necessary to place on order a further unit of the same size, for which space was provided in the new engine house at Thornhill. Of the recent issue of £71,640 of 6 per cent. cum. pref. shares, £42,845 has been taken up, leaving £28,795 still available. Numerous applications have been received during the past half-year.

**British
Thomson-
Houston
Co., Ltd.**

Mr. H. C. LEVIS presided at the annual meeting, on Monday. He said that the total number of employés who had enlisted was 1,309, and, quoting the figures given in the report as to those who had fallen or had won distinction, he said that the company had a fine record in this matter. They did not recommend the payment of dividends, as it was deemed wise to use the surplus profits for further depreciation of the goodwill and plant accounts. The goodwill was brought down by a further £40,000, leaving it at £60,000. They had expended £88,535 on plant. The total writing off from plant for the year was £116,000. Holdings in shares and debentures of other companies were valued very conservatively. Their profit for the year involved heavy payments to the Government, but they were glad that circumstances were such that their contribution could be so large. Last year they made a reserve of £25,000 to take care of possible depreciation in raw material, but this year they wrote it back, and used it for other depreciations, because it was not required, and as it was proposed under the Finance Bill that they would have two years within which to liquidate their stock of raw material, there was little danger of making a loss in that connection. The loan from the General Electric Co. of New York had increased by £57,000.

**Marconi's
Wireless
Telegraph
Co., Ltd.**

The net profits for 1916, including the balance brought forward, after providing for expenses of management, depreciation, and all other expenses, were £625,980. After paying 12 per cent. on the preference shares and 15 per cent. on the ordinary shares for the year, £412,576 remains, of which £32,470 is to be transferred to general reserve account, and £380,106 is to be carried forward. The general reserve account will now stand at £1,000,000. Larger dividends are not recommended as, in view of the demands for apparatus and material likely to be made upon the company on the cessation of hostilities and the uncertain financial outlook, the directors deem it prudent to strengthen its financial position. Shares in associated companies and patents are taken into account at their cost price, as usual, and they stand at £1,403,923, an increase of £20,266. The par value of the shares now stands at £2,487,451, exclusive of shares which have no capital denomination. Owing to unfavourable rates of exchange large sums of money have been invested temporarily or placed on deposit abroad. The loss represented by the rates of exchange calculated on December 31st, 1916, has been written off against profit and loss account. In the event of ultimate realisation without loss, the amount so written off will appear as profit in another year. The company is still without any remuneration or compensation from the Government for the use since the beginning of the war of the company's high-power stations and for other relative services. Moreover, the company has not yet been afforded an opportunity of considering any proposal as to the basis upon which either remuneration or compensation is to be calculated. For the third year in succession, therefore, it has been impossible to include any sum in respect of these matters in the accounts. A number of orders have, however, been received by the company from Government Departments in respect of which payments have been duly made. The four heads under which considerable sums are payable by the Government were set out in the directors' report last year, as follows:—

1. Remuneration and compensation by the Post Office in respect of the use of the company's high-power stations since the beginning of the war, the staffing and management of those stations, and other services in connection therewith.

(Under the above claim the company has been repaid part of its out-of-pocket expenses, but the expenditure incurred is considerably in excess of the payments received.)

2. For the use of the company's patents by the Admiralty since the expiration, on March 31st, 1914, of the Admiralty agreement of 1903.

(Shareholders were informed last year that the company had received the assurance that the matter would be dealt with as quickly as possible. This assurance has been repeated.)

3. In respect of the use of the company's patents by the War Office, without agreements, during the whole time wireless telegraphy has been used by the War Office.

(The War Office has informed the company that this matter cannot be dealt with until after the war.)

4. For compensation by the Post Office in respect of their withdrawal from the contracts for the Imperial chain of stations.

(There have been repeated negotiations with a view to a settlement of this matter, which are still proceeding.)

The Marconi International Marine Communication Co., Ltd., has continued to show a substantial development in its business and increased profits. Dividends for the past year amounting to 15 per cent. have been declared. The company has taken steps to increase its authorised capital to £600,000.

The Russian company, the Société Russe des Télégraphes et Téléphones sans Fil, has continued to do a large business, and a dividend at the rate of 17 per cent. for 1916 has been declared.

The French company, La Compagnie Française Maritime et Coloniale de Télégraphie sans Fil, has declared a dividend for 1916 at the rate of 12½ per cent. on the ordinary shares and 140.62 francs on the founders' shares.

The Amalgamated Wireless (Australasia), Ltd., has paid a dividend of 5 per cent. in respect of the year ending June 30th, 1916.

The net income of the Marconi Wireless Telegraph Co. of America for 1916 was \$259,888, as compared with \$177,316 for the previous year, and the total surplus now carried forward amounts to \$801,776. The very large orders now being executed on behalf of the Government of the U.S.A. have necessitated the construction of considerable additional factory accommodation. The American Trans-Atlantic stations which were expected to constitute the principal source of revenue have remained idle in consequence of this company's stations continuing to be employed by the Government. A very satisfactory telegraph service was being conducted from the Pacific Coast across the Pacific Ocean to the Hawaiian Islands and Japan up to the time the United States entered the war, when the Government took possession of the stations. Negotiations were immediately opened, and are progressing rapidly towards settling the basis of the payments to be made to the company, and final agreement is expected to be reached promptly.

Since the last report submitted to the shareholders, the action brought by Messrs. O. Locker-Lampson and Peter E. Wright has been discontinued. In view of the unconditional withdrawal by the plaintiffs of all charges, the company and its directors agreed not to look to them for the payment of their costs, which will be borne by the company. Mr. H. W. Allen and Mr. W. W. Bradfield, who have been associated with the company since its inception, have been elected to the board. Mr. M. A. Bramston, a director of associated companies, has joined the board. Annual meeting: August 9th.

***Austrian Companies.** The Hungarian Siemens-Schuckert Werke report gross profits of £177,000 for 1916, and net profits of £24,000.

The directors of the *Vcr. Telefon und Telegraphen Fabriken A.G. Czeija, of Vienna*, recommend a dividend of 12 per cent. for 1916, as contrasted with 9 per cent. in the previous year.

The report of the *Gesellschaft fur Elektrische Industrie, of Vienna*, states that the works were fully occupied in 1916, particularly in the production of machines and transformers, owing to the growing demand for direct and indirect war orders. An extraordinary increase in the cost of raw materials, wages, and general expenses took place, especially in the second half of the year, and it was becoming visibly accentuated. It was only possible in a few cases to raise the sale prices of manufactures to a corresponding extent. The net profits are returned at £28,000, as against £16,000 in 1915, and a dividend of 10 per cent. is proposed, as in the preceding year.

The *A.E.G.-Union Elektrizitats Gesellschaft, of Vienna*, states that the shops were crowded with work in 1916, and many orders remained unfilled. Apart from contracts for the Army authorities, the collieries and ironworks, and the munition factories, numerous orders were received for the chemical industry in connection with the cyanamide works in course of erection. The gross profits are reported to amount to £200,000, as compared with £183,000 in 1915, and the net profits to £75,000 and £46,000 respectively. It has been decided to distribute 8 per cent. on the increased share capital of £833,000, as against 6 per cent. on £666,000 in 1915.

The *Oesterr. Siemens-Schuckert Werke A.G., of Vienna*, report that the great technical requirements for the war had converted the company's departments on the whole into electrotechnical war shops, and had almost entirely excluded works for peace purposes. Most departments were engaged on urgent orders throughout 1916, but operations were hampered by the scarcity of trained and expert workmen, and the length of the shifts had consequently to be extended, and to be supplemented by night shifts in so far as it was technically possible. As a consequence, the customary careful overhaul of the machinery and plant had to be restricted, and a considerably greater depreciation took place. The gross profits amount to £780,000, as compared with £611,000 in 1915. After meeting general expenses and other charges, and placing £104,000 to depreciation, as against £68,000, the accounts show net profits amounting to £126,000, as contrasted with £118,000 in 1915. It is proposed to distribute 7 per cent. on share capital of £1,333,000, the same rate as in the previous year.

London & Suburban Traction Co., Ltd.—It is not proposed to pay an interim dividend on the preference shares for the half-year to June 30th.

Hong-Kong Tramway Co., Ltd.—Dividend, 9 per cent., less tax (interim).

National Gas Engine Co., Ltd.—Interim dividend at the rate of 5 per cent. per annum, less income-tax, on the preference shares, and 7½ per cent. per annum, less income-tax, on the ordinary shares for the June half-year.

North London Railway Co.—Interim dividend, 2 per cent. for the half-year.

Bristol Tramways & Carriage Co., Ltd.—Interim dividend at the rate of 5 per cent. per annum for the June half-year on the ordinary shares.

Metropolitan Railway Co.—Interim dividend at the rate of 1 per cent. per annum on the ordinary stock. Interim dividend on the Surplus Lands Stock at the rate of 2½ per cent. per annum.

Charing Cross, West End & City Electricity Supply Co., Ltd.—Interim dividend on the ordinary shares of the West End undertakings for the June half-year at the rate of 4 per cent. per annum.

Westminster Electric Supply Corporation, Ltd.—Interim dividend at the rate of 8 per cent. per annum, less income-tax, for the half-year ending June 30th.

Russia.—The Wolframite Co.'s statutes have been approved. It will operate in Transbaikalia. Capital, 200,000 roubles.

The Russian Regional Electrical Stations Co., capital 4,000,000 roubles, closed its (1916) working year with a profit of 523,263 roubles. It will pay 4 per cent., as in the previous year.

The statutes of the Russian Accumulator Co. have been approved, capital 2,700,000 roubles. This company was formed to take over the Russian "Tudor" Accumulator Factories, Petrograd.

France.—The Mediterranean Electrical Co. (*L'Energie Electrique du Littoral Méditerranéen*) is increasing its capital, owing to the development of war requirements, from 38 to 60 million francs (from £1,520,000 to £2,400,000). Formed 17 years ago to develop and supply electrical energy in the Mediterranean region of France, its operations have been greatly expanded under the stimulus of war. Its earnings, which in 1914 amounted to 7,583,000f., rose to 11,032,000f. in 1916, and this year are expected to reach 13,000,000f. The dividend last year was 6 per cent.—*Times*.

A new company has lately been formed in Paris with a capital of £6,000, and the title *La Société du Secteur Electrique de la Rue d'Angouleme*. *La Société Hydro-Electrique de la Maurienne*, of Paris, has also recently increased its capital to £400,000.

STOCKS AND SHARES.

TUESDAY EVENING.

STOCK EXCHANGE business has not given any sign of revival from the quietude into which it dropped when the Russian crisis became acute. Cheerfulness is shown by Brazilian issues in consequence of a brisk rally in the Rio rate of exchange. Industrials still command the greater part of what business there is in the markets. The Marconi Co. has raised its dividend from 10 per cent. to 15, but the shares are unchanged.

It is inevitable that memories should dwell just now upon the changes wrought by exactly three years of warfare on the colossal scale. The Stock Exchange is naturally looking up its 1914 records and prices. Some of the latter we quoted here last week. Electric Railway stocks have shared in the general depression which Home Railways have been unable to escape during the period, depression broken by few and brief spurts of strength. Most Mexican bonds and stocks have fallen very heavily, those of the electrical power companies with the rest. It would not be fair, of course, to lay all the blame for this weakness at the door of the war, although without a doubt the war has been a prominent factor.

Electricity supply shares are lower on balance. The companies have had peculiar penalties to pay as their share of the war, the Daylight Saving Bills and the lighting restrictions being two of them. We ring some of the changes that have occurred during the three years in this table:—

Share.	July 27, 1914.	Now.	Rise or fall.	Share.	July 27, 1914.	Now.	Rise or fall.
Brompton ..	94	6½	-28	Kensington ..	7½	5½	-2½
Brush 1st deb. ..	54½	61	+6½	London ..	1½	1	-½
Ditto P. Lien ..	82½	77	-5½	Metropolitan ..	3½	2½	-1
Charing Cross ..	5½	3½	-2	Notting Hill			
Ditto pref. ..	4½	3½	-1	pref. ..	9½	8	-1½
Chelsea ..	4½	2½	-2	St. James's ..	9½	6½	-3
City ..	16	12½	-3½	South London ..	3½	2½	-1
County ..	12	11½	-½	South Met. ..	1½	1½	0
Edmundson's 1st				Westminster ..	8½	5½	-3
Deb. ..	83½	69½	-14	Ditto pref. ..	5½	3½	-2

South Metropolitan ordinary shares have more than doubled in price, but the two preference issues are down, and the 4½ per cent. debenture stock has dropped from 98½ to 81, a fall of 17½ points.

The Marconi report shows the company to be in a strong financial position, and, as already mentioned, the dividend is to be raised from 10 per cent. to 15 per cent. Some disappointment is felt, however, at the absence of any Government payment even yet for the services rendered by the company since the outbreak of war, though it is taken for granted that information on this head will be forthcoming at the eagerly-awaited meeting. Meanwhile, the shares remain at 3½, and the speculative investor is said to be quietly picking them up.

Mr. McKenna's recent threat of a further advance in the income-tax has diverted fresh attention to securities upon which the dividends are at present distributed net. Underground Income bonds have accordingly recovered a point of their last week's drop of 4. India-Rubber shares put on 10s.,

the yield still coming to the equivalent of over 10 per cent., less tax. Eastern Telegraphs are up 2, and Eastern Extensions 2s. 6d. Other cable issues are mostly strong. Oriental Telephones have gone back $\frac{1}{2}$ after their too rapid rise. Chile Telephones are better to the extent of the ex dividend marking last week.

Brazilian Tractions have responded to a spurt in the Rio rate of exchange. At 50, the price shows a fall of 16 as compared with July 27th, 1914; this is a small shrinkage, having regard to the fact that in those latter days the company was paying 6 per cent. on the shares. British Columbia stocks are flat, the $\frac{1}{2}$ per cent. debenture being $2\frac{1}{2}$ lower on the week, and $4\frac{1}{2}$ down since three years ago. The preferred ordinary at $30\frac{1}{2}$ has fallen no less than $75\frac{1}{2}$, and the deferred 79 $\frac{1}{2}$, since the outbreak of war. Mexico Tramways Firsts are 48 points to the bad; all other Mexicans have suffered severely.

London and Suburban Traction preference are weak at 6s. 6d., the board having decided to pass, or postpone, payment of the interim dividend due now. The dividend is cumulative. An interesting report is just published by the Indo-European Telegraph, the company whose direct line crosses Germany. Net profit has fallen away by £27,000, to £59,100, and the dividend would be reduced to 7 per cent., as against 13 per cent., were not the latter rate maintained by the addition of 6 per cent. from interest received. The dividend has now been 13 per cent. for 13 years.

Manufacturing shares are steady. Babcock at 3 $\frac{1}{16}$ are $\frac{1}{16}$ up; the price was $2\frac{3}{4}$ three years ago. British Insulated have risen $2\frac{3}{4}$ in the war period; British Westinghouse preference 10s., Callenders $2\frac{1}{2}$, Henleys £1, and India-Rubbers £4. Curiously enough, Telegraph Constructions at $38\frac{1}{2}$ show no net change at all.

American Copper Output.—It is estimated that the copper refineries of the United States turned out about 185,000,000 lb. of copper during the month of May. This was through maintenance of about the same basis as in April, when the yield was 180,000,000 lb., allowing for a 3 per cent. increase on account of the extra day. There has been no close approach to the December record of 200,000,000 lb., which was the result of combined efforts of the country's refining plants in the closing month of last year. New refinery capacity has been gradually completed, and much of the expansion programme among the various plants has yet to be carried out. Despite the fact that capacity will be somewhat in excess of 200,000,000 lb. monthly, it will be largely a "paper" capacity with equipment held in reserve against delays that may occur at other portions of plants. During the past two years there has not been a bit of idle equipment, and the result has been that, under forced pressure and operation for such a long period, there will have to take place considerable replacement work. In the opinion of some of the refinery officials the country's refined copper yield will range in the future between 180,000,000 and 190,000,000 lb. monthly, and, upon occasion, possibly 200,000,000 lb. With the lower estimates fulfilled, the refineries will be caring for every pound of raw product that will have been shipped from the mines.

Interruptions to mine operations in the winter months, reflected by smaller receipts at refineries 60 to 90 days later, will be offset in the summer months by extreme heat at the refineries, making impossible full operation.

Another factor in keeping down the yield from refineries continues to be found in the inefficiency of labour. The highest wage scale ever paid, instead of making better workmen, has the opposite effect among the refinery employes, and it now takes 30 hours to perform work ordinarily handled in 24.—*Electrical Review and Western Electrician.*

A New Insulating Material.—A new patent insulating material, which it is claimed, is hard, almost incombustible, and non-absorbent, can be moulded and wrought, and is suitable for replacing porcelain, marble, slate, and vulcanised substances, has been described in *Industria e Inveniones*. It is composed of pulverised asbestos, 52 per cent.; sifted mica, 11 per cent.; "mineral caoutchouc," 20 per cent.; rubber solution, 10 per cent.; sulphur, 3 per cent.; and resin, 1 per cent. These proportions are approximate, and may be varied.

THE POSITION OF THE ENGINEER IN NATIONAL AFFAIRS.

At a special meeting of the AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS, the President, Mr. H. W. BUCK, delivered an address on this subject. The following abstract is based upon the *Electrical World* report:—

The change and improvement in the engineer's position in the world in recent years have been so rapid as to surprise even those who were the optimists in the under-dog days of the engineering profession. The engineering profession is coming into its own. A flood of scientific and technical accomplishment has swept over the face of the earth, revolutionising life, commerce, and international destinies.

In all this development period of the engineering profession during the last century the engineer has worked his way along alone and in silence, so to speak, seeking his reward rather in the joy of accomplishment and in the realisation of his dreams than in worldly recognition and accumulation. The very inherent greatness of the pioneers who have laid the foundations upon which we now build prevented them in a way from acquiring a more worldly position in affairs. This tradition, however, is not a virtue beyond a certain point, and the engineer by nature is too willing to give way to others. The time has come when he should take a more worldly position in the world which he himself has created.

In our general relations to intellectual development we may consider that we are just emerging from a classical period where tradition, custom, prejudice, ignorance, and dogmatic religion were the controlling forces. Movements which took place in world affairs were largely political, following the paths best suited to the advantage of the ruling classes. There was little real progress, because there was no development of scientific knowledge and its application in engineering. Scientific truth held no standing. The worship of tradition caused a powerful reaction against any scientific discovery which might necessitate a readjustment of established habits of thought and life.

A constant change in point of view, which is so largely brought about through developments in scientific knowledge, seems to be necessary for progress in civilisation. Our civilisation to-day differs from that of a century ago in proportion to the scientific and engineering evolution which has taken place during the period through its reactions on life in all of its phases. Such discoveries in science as the law of gravitation, the evolution of species, the laws of electromagnetic induction, &c., have probably had a more profound effect upon the development of the human race than any other acts in history.

The engineering profession has passed through the preliminary stages of its growth, and has reached a position where the engineer should work and act, not only with proper attention to his work itself, but with full consciousness of the important relation of his work to human affairs in general. Among the early pioneers in engineering were many notable instances of men of great breadth of view. Of recent years, however, under the stress of commercial development and economic conditions, increasing specialisation has taken place and the engineer has become obliged to compass his mind with an ever-narrowing horizon. This specialisation produces extraordinary proficiency in particular fields, but has the objectionable effect of narrowing the character and outlook of the man, and of reducing his value as a citizen. We must take care lest commercial considerations and the modern mania for efficiency in the narrow sense force our engineers to lose sight of the world around them in their concentrated attention to the part rather than to the whole. This excessive specialisation is a danger which threatens the future standing of the engineer.

It is interesting to recall in this connection the results of a recent canvass made by a joint committee on education on the qualities which, in the opinion of about 5,000 leading men, engineers and others, best fit a man for a successful career as an engineer. As a result of this vote, only 13 points out of 100 were assigned to purely technical knowledge as an essential, the other 87 points being allotted to broader qualifications, such as judgment, character, human understanding, &c. This is merely a quantitative statement of the many general demands now being made of the engineer, and it illustrates how his work has broadened out. It is an interesting and encouraging symptom.

A most significant movement of recent times in the engineering world has been the development of co-operative action among engineers of all classes, and this tendency will, I believe, serve to offset the evils of specialisation. It is the growing recognition of the fact that all branches of engineering are interdependent. We electrical engineers, I believe, are well aware how much we need the assistance of other branches of engineering for the successful fulfilment of our purpose.

This co-operative movement has quite recently been given tangible expression in the formation of the Engineering Council, an act, I believe, of far-reaching consequence. Under this organisation, as a beginning, the Civil, Mechanical, Mining, and Electrical Societies, together with the United Engineering Society, are tied together for co-operative action through a joint body of 24 representatives. This body will

meet at frequent intervals, and will deliberate on matters of general interest to engineers. It is an encouraging beginning toward universal co-operation among engineers in all branches of work.

In this Engineering Council we have for the first time an engineering body, representing about 30,000 engineers, of sufficient scope and standing to create an engineering public opinion. Its influence is likely to be far-reaching in building up the prestige of engineers in both technical and civic affairs. A further development which has reached full recognition only in recent times is the mutual appreciation which has grown up between the engineer on the one hand and the worker in pure science on the other.

The engineer looks to the scientist to provide him with raw materials of knowledge with which to work out his applications, and the scientist must look to the engineer to make his discoveries so fruitful that the full effectiveness of his work on the frontier of research can be sustained. Both are working together in order to unfold nature in the most effective way for the benefit of man.

All of the important movements taking place at the present time which centre around the engineer and his work mean, I believe, that the engineer is soon going to leave his position of isolation in independent fields of work and realise that he owes an obligation to the community broader than his daily engineering work, and will contribute to the general welfare his talents and experience. It matters not whether the problems before him are political, sociological, industrial, or technical; I believe that the engineering type of mind, if the proper breadth of view has been acquired, is best fitted to undertake them.

It is not necessary, perhaps, in important administrative positions to have civil, electrical, or mechanical engineers as such, but we do need men in those positions who have had training of the type which engineering gives, with the mental balance, the power of analysis which such a training develops, the resourcefulness and the faculty of recognising and properly apportioning the various elements in a problem. There is a quality of mental honesty which engineering experience highly develops which is sorely needed in public life. The scientific and engineering professions should rise up and furnish such men from their ranks for the welfare of the country.

I believe that we can confidently look forward to a new era for the proper fulfilment of the destinies of the engineer. Out of this world chaos we now see men of engineering and scientific training rising to positions of commanding prominence on all sides. It is simply the working of the inevitable law of the survival of the fittest.

In this great movement not only must the individual engineer play his part, but the great engineering societies must realise the power of influence which they are developing in an ever-increasing degree in the community at large, and the obligations which devolve upon them.

And so I hope that the American Institute of Electrical Engineers, as it passes along from one administration to another, will acquire an increasing realisation of its duty, not only in furthering the growth of science and engineering, but in furthering the influence of the engineer in the affairs of the country and of the world.

A NEW INDUSTRIAL LEAGUE.

(Concluded from page 81.)

MR. GEORGE H. ROBERTS, M.P., said that the greatest of all the problems that would have to be dealt with after the war would be the problem of the relationship of employer and employed. The war would have had a tremendous effect on the whole of our system of society. We should have dissipated tremendous wealth; should have lost even more in flesh and blood than in material things; and we should have to face great problems of recuperation, reconstruction, and trade expansion if our country was to retain its hold on the markets of the world. The great question before us was: "How is our country to maintain its commercial position of eminence?" In his view, if the old disputations remained, if employers and employed were ranged in conflicting camps, the ravages of war would not be repaired, reconstruction would be impossible, and as sure as night followed morn, so would the decline and fall of the British Empire set in unless they were able to solve the great question then under discussion. He had always been an agitator, but he felt that if his views ought to be modified in any way, he claimed that human quality of courage to express such modification. He had come to the conclusion that many of the things he hoped for in the days of his youthful enthusiasm were not going to be achieved merely by the hoping. Those great human problems were not going to be solved by the application of any heavenly alchemy. Human problems had to be worked out by human beings, and therefore mistakes would always be made; but they must risk those mistakes in order that they might gradually grope their way to a better and more perfect state of things. Those who had been associated with their movement had recently been immensely heartened. He

had something to do with the setting up by the Government of a sub-committee of the Reconstruction Committee to deal with the problem that mainly concerned them—the relationship of employer and employed. They rejoiced to know that men of varying views, men who, before the war, could never have agreed on any one subject, had agreed to sit round a table to discuss this problem, and had submitted recommendations. Holding diverse views, they had unanimously submitted recommendations in accord with the fundamentals of the movement. They recognised that after the war there would be a great need for industrial harmony. They perceived that unless the employer and the employed worked together in friendly co-operation the history of the British Empire must be cut very short. Men with extreme labour views had joined with employers of orthodox opinion, and, if acted upon, their recommendations would do a great deal towards rehabilitating our country, and helping to promote a friendly feeling and clear understanding between the various industrial classes of the community. They desired to further the recommendations of the Whitley Committee. He had no illusions. The interests of employers and employed would never be identical any more than the principle of nationality or the interests of buyer and seller would be identical, but up to a certain point there was a community of interest. They proposed to develop the movement which was represented in the Industrial League. They believed that by its development they would be conferring a substantial advantage on the country, and they were going to develop as from that night. He would like to see a Director of Industrial Harmony appointed. He wanted to impress on employers and those who had influence with them the need of recognising that mere expressions of sympathy were not going to tend to the pacification of the working classes. They had to produce substantial results. The working classes were impressed with the belief that they got plentiful promises but no substantial results. If they wanted to establish industrial harmony in this country they had to show that, by that policy, substantial results would accrue not to one but to every class in the community. He was certain that if they pursued that policy then, just as before the war there was industrial chaos, so in the days when peace was restored they would be able to say that industrial cosmos had emerged.

Sir ARCHIBALD DENNY remarked that he entirely sympathised with the idea of getting the employers and employed together. In the old days the works were smaller, and they knew their own men much better. The principle of his own firm was that those who came to rule in the works must have served their time through the works. When he began his time they had payment by results in the iron trades; his elder brother introduced payment by results. That system had continued ever since, and he thought theirs were the only works in the kingdom where piecework in the joiners' shop of a shipbuilding yard was practised before the war. In 1877 they wanted to introduce the system into the carpenters' shop, but the men would not have it, and they struck. They were afraid that their rates would be cut as soon as their output was discovered. That was quite a natural fear. After the strike had lasted some time the men said that if they would give them an assurance that rates would not be cut they would accept the system. They did that, with the result that the system was continued ever since, and had been perfectly satisfactory. He had great faults to find with employees. It was very difficult for the employers to deal with the trade union leaders, because they were never quite sure whether they could deliver the goods. That difficulty arose from the fact that, either from force of circumstances or from their own management, there had been created a power inside the unions which seemed to dominate the situation. Their leaders had always to take a vote before anything could be decided, and that was not very useful. The leaders were quite strong enough to carry their points in discussion with the employers, and were a good deal cleverer, therefore they ought to be able to deliver the goods. Credit was a great thing, and if they shook it, then there would be neither money nor anything else. They had to produce the goods as cheaply as they could. If there was a rise in wages and no rise in production, then they would not be a bit better off. They had to produce things more cheaply than they had ever done before, and then they would be in that state of comfort which they all desired. No one approved of low wages. Why did we pay them? Because we had competition, and competition with the foreigner was as hard as it could be, but there was also competition amongst ourselves in this country. He was not speaking as a syndicalist. It was cheap things they wanted to produce, and then they would all be as comfortable and happy as the day was long.

The Rt. Hon. F. HUTCH JACKSON, the next speaker, said that, personally, he entirely supported the recommendations of the Whitley Committee, but the execution depended upon the goodwill and the co-operation of the employer and employed. So far as he could see at the present moment, that co-operation was by no means such a certainty as he should wish it to be. He had been associated with another movement which had objects similar to those of the movement represented there that night. For what they were worth they were perfectly willing to co-operate with any other movement which had the same object in view, and to co-operate in the most whole-hearted manner for the achievement of the end which was so much desired. He very strongly deprecated any idea of

competition between this movement, their movement, and any other movement for promoting more amicable relations between employers and employed. It would be a national disaster if they had organisations which, while having the same object in view, were working on different lines, and he therefore hoped (and he felt perfectly certain of it as far as his movement was concerned) that the spirit of co-operation would be present. They wanted co-operation, not competition.

Mr. G. WARDLE (Acting Chairman of the Labour Party) said that if he were to focus in a sentence what was the result of the present meeting, he would say that they felt that something must be done to prevent an industrial war after the present war. He was not going to blind them to the fact that there was a considerable amount of underlying suspicion which hit the labour people as hard as it hit the employer. He was anxious for the sake of the future of the country, and for the sake of the workmen, as well as the employers, that something should be done to stop what was going on now. It could not be stopped by force, but it could be stopped by convincing the worker that the next step, whatever might be the ultimate step, was to secure co-operation between the employers and employed in order to bring about a better state of affairs. Everyone worked for mixed motives, but if their motive was unselfish within reason it could be done. That meeting might be historical, but the thing would not have to stop there, and they would not have to deal with Labour leaders only; they would have to go down to the men. They would have to get the men together. It was not always the fault of the men that there was no co-operation. They did not get the chance. Let them understand what was at stake. He could see what was happening—they could not. He could do his bit, but only at great risk and under great suspicion. If they wanted to destroy the seditious spirit that was abroad amongst a certain section in the country the only way they could do it was by absolute frank openness between themselves and their employees.

Mr. BLAIN proposed a vote of thanks to the Chairman. Mr. W. A. Appleton (secretary of the General Federation of Trade Unions) seconded, and Mr. Lee Murray briefly responded.

ELECTRIC VEHICLES IN SHEFFIELD.

IN the discussion on Mr. PRIESTLEY's paper (ELEC. REV., July 20th, p. 55), before the INSTITUTE OF CLEANSING SUPERINTENDENTS, for a report of which we are indebted to *The Surveyor*, the author remarked that they might assume that a horse cost 13s. 6d., and that a motor vehicle would replace two horses without any additional rent. If they had horses and two drivers replaced by one vehicle and one driver, it was a paying concern. His experience had shown that so far as Sheffield was concerned the best point for electrics for refuse collection was a total journey from dépôt to dépôt of about three miles. If the journey was less than that distance they thought that horses could do the work slightly cheaper than electrics.

The PRESIDENT (Mr. TERRY) said that Nottingham corresponded almost exactly with Sheffield in its local conditions, and the figures obtained from the working were almost identical, but he differed somewhat from Mr. Priestley with regard to the three-mile limit. The first two vehicles which Nottingham obtained were three-ton vehicles, and they had some journeys covering five miles. He presented some figures to his Committee in March last, and worked out the whole of the working cost, and the total amount of refuse collected, and compared the average cost per ton with the average cost per ton of horses worked throughout the city. Taking the two farthest distances and the two nearest distances, he thought that the cost showed a fair average for the city, and, compared with the average cost for horses' work, these figures for three vehicles from October, 1915, to February last showed an average cost per ton of 4s. 4.7d., and for four vehicles an average cost of 4s. 1.4d., while the average cost per ton of the horse vehicles was 5s. 1.3d. per ton. That was showing a considerable saving in favour of electrics.

Ald. W. ROBERTS (Liverpool) said that, as the members knew, he always believed in horses. But he had had the opportunity of reading Mr. Priestley's paper on electric vehicles, and evidently, from the figures, these vehicles had worked remarkably well. In Liverpool they had a large number of horses, between 300 and 400, and a number of petrol-driven vehicles, for their engineer believed that they could run a petrol-driven vehicle much cheaper than an electric. For certain distances he believed that horses were more economical, but there seemed no doubt that for long distances the petrol vehicle, or the electric, could beat the horse. Everything depended in connection with these petrol-driven or electric-driven vehicles on getting them loaded quickly and lightened quickly. They must always keep them working to make them pay.

Mr. W. GREIG (Glasgow) said Mr. Priestley told them that in Sheffield each man and horse cost 13s. 6d. a day. He thought that was extremely low. In Glasgow it cost 16s. 6d., but, on the other hand, in Glasgow they got more work out of their horses. In the next table, about electric vehicles,

Mr. Priestley said that he was guaranteed a 10-years' life for the vehicle, and he went on to say, "One half the cost of the vehicle is represented by the battery, and this is guaranteed to give 100 per cent. of its original efficiency after eight years' continuous service, and any defects due to misuse are made good by the makers during such period." In Glasgow they purchased an Edison battery vehicle, and they were only given a guarantee of four years on 40,000 miles, with 90 per cent. for the next year, and 80 per cent. on the remaining year, so that he thought the estimate here should have a five years' life instead of ten. But, notwithstanding this, the cost of electric vehicles in Glasgow for collection and haulage was 3s. 10d. per ton, and for horses 4s. 2d. per ton.

Ald. C. C. ELLIOTT (Newcastle) said that he had had 25 years' experience of haulage with steam and petrol wagons. There was nothing to challenge the electric vehicle for intermittent work and varied loads, and the house-to-house deliveries to a distance of three miles. Take an electric car to carry two miles, however, and they would find that a petrol car worked out cheaper than the electric. They were also doing short work, and loading about a mile and a half, and the cost of the horse cart compared with the petrol, or the electric, or the steam vehicle, was higher. But he did not think that they could lay down a general law. For long distances over six miles they could not beat the steam wagon for loads of five tons and upwards. The horse would always have its place in the very short distances.

Mr. R. DIGGLE (Accrington) said that in Accrington they had had one of these vehicles for about two months, and the distance they had to carry their stuff was within a radius of two miles. He could assure the conference that the electric vehicle had come to stay, and that if they could get another they would have one next week. The vehicle was bringing in about 20 loads a day. It had had the advantage of being in competition with the horse, and the horse had been doing more work because of the competition. They had reduced the cost per ton by 1s. Besides that, they had a system of bonuses; the men had been earning more money, and were quite satisfied. In the short distances the electric vehicle would compete very favourably with the horse.

Mr. T. STAKE (Stoke-on-Trent) had seen a three-tonner and a two-tonner on the previous afternoon, and was very pleased with the ease with which the thing was manipulated; but he thought that the body was built far too heavy to carry two tons of house refuse. These bodies would be quite capable of carrying anything from five to seven tons of any kind of material.

Mr. H. HOPKINSON (Portsmouth) said he had not the slightest doubt about the accuracy of Mr. Priestley's figures. He foresaw a big extension of this business, and although he was a horsey man, and had many horsey men on the committee, they had changed their policy. They had got almost *carte blanche* now. His committee was perfectly satisfied that they had beaten the horse off the face of the earth as regarded the collection of refuse.

Mr. PRIESTLEY, in reply, said with regard to the cost of bringing in a motor when it broke down with a load, he had had a good deal of experience, and he considered that it formed an infinitesimal proportion of the cost. To know that he had got four years more guarantee on his battery than Mr. Greig had been able to get for his delighted him. One or two references had been made to the question of the three-mile limit. Referring to the conditions which obtained in Sheffield in the collection of bin refuse, their experience was that they loaded and got away rapidly—where the refuse was already out in the street—and the figures for loading showed that the electric could beat the horse at any distance. No time was lost in charging. The vehicles were charged in the depot at night between the day and the night service, and when they came in for meal times, either during the night or during the day, if necessary. He did not agree that the weight of the body was in excess of what was required. The tire wear depended on the conditions of the district. Their tire wear was very much in excess of the tire wear in Nottingham. Mr. Terry had had his vehicles at work since October, 1915, and had only recently renewed. In Sheffield they had renewed more than once, but they had an arrangement with the tire manufacturers to work them on bare maintenance cost, and the prices that were given per mile were what they were paying for the maintenance of their tires.

artistic design of wall plug and socket suitable for use in private houses. With the introduction of portable electrical apparatus into factories this problem has assumed difficult proportions, and with the publication of the Home Office Regulations governing the use of electricity in factories, the problem has been still further complicated.

To comply fully with the requirements of the Home Office Regulations, and also with the requirements of factory engineers, it has been necessary to design a wall socket and plug which, while being of thoroughly sound mechanical construction, provides that:—

(a) The wall socket must be combined with a multipolar switch, by means of which the tubular contacts in the socket may be rendered "dead."

(b) The plug must be so interlocked with the switch and socket that it is impossible to insert the plug while the switch is "on" and the tubular contacts "live," and it must also be impossible to withdraw the plug unless the tubular contacts are "dead."

(c) The multipolar switch must break contact on each pole.

(d) The apparatus must be efficiently earthed, and it must be impossible to break the earth unless all the contacts are rendered "dead."

(e) The plug having been withdrawn, it must be impossible for anyone to turn the switch on and thus make the tubular contacts in the socket "live."

(f) The apparatus must be so constructed that when necessary it can be rendered absolutely water-tight, and it should also be so constructed that when necessary it can be rendered flame-proof for use in mines.

MESSRS. DONOVAN & CO., 17, Cornwall Street, Birmingham, have recently designed and patented a unique type of wall socket and plug, which, while possessing great mechanical strength, fulfils all the above requirements.

The socket and switch are enclosed in a cast-iron case, which can be rendered water-tight and flame-proof. The switch is of the multipolar type acting on each plug contact, and is so arranged that when the plug is withdrawn the contacts are "dead," and cannot become "live" unless the plug is inserted.

The mere act of inserting the plug does not operate the switch, as has been the case in all previous designs. In the design under

FIG. 1.—DONOVAN WALL SOCKET AND PLUG.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

Donovan's Patent Combined Switch, Wall Socket, and Plug.

The problem of connecting portable apparatus to a permanent source of supply has occupied the thoughts of electrical manufacturers for a number of years, but their principal efforts have been directed towards the production of a convenient, small, and

notice the plug is provided with a key, which operates the switch by turning to the right or left, and the plug is so arranged that it cannot possibly be withdrawn unless the switch is in the "off" position, and, further, if the switch and socket were removed from the case, and the switch were put on before being returned to the case, it would be impossible to insert the plug.

The switch is of the quick-break rotary type, with absolutely free handle arranged so that the switch cannot be held in semi or partial contact. Both the socket and plug are each made of a solid block of ebonite, thoroughly shrouded in a massive metal case. It is claimed that the whole of the apparatus is, in addition to being a perfect electrical device, a thoroughly sound mechanical article, which immediately appeals to the trained engineer.

This type of apparatus is specially suited for use in factories, shipyards, ironworks, motor garages, coal mines, and on steamships, and no doubt it will also be largely used in theatres in connection with stage lighting and heating.

A Handy Motor Ladder.

We are indebted to Mr. L. L. Horrell, assistant electrical engineer to the municipality of Pretoria, for the photograph here reproduced, showing a "motor ladder" outfit which the electricity department is using. Pretoria is one mile wide and seven miles long, and has 4,600 consumers, all of whom, with the exception of a few in the centre of the town, are fed off overhead bare-copper mains run on 36-ft. steel poles. S. V. MOSELEY.

This motor ladder is used for getting to the consumers quickly for disconnecting, connecting, and attending to "All lights out." Since the outfit was put in commission, seven months ago, it has

FIG. 2.—MOTOR-CYCLE LADDER.

averaged 1,000 miles per month, and has saved the department in wages alone over £70, besides giving a better service.

As will be seen, the chassis is attached to a 6-H.P. Royal Enfield motor-cycle. The weight of the load on the chassis is 260 lb. The bicycle takes the hills without the least difficulty, and runs well. The department has had no expenses besides ordinary running costs: the whole outfit cost £120, and will therefore pay for itself in the first year.

A Telephone Battery Economiser.

With telephones of the newest and most economical type, with respect to battery consumption, the loss from 20 listening telephones is not less than 84 watts, and as this energy comes from dry batteries, the loss is equivalent to burning about thirty 25-watt Mazda lamps on 10-cent current, not counting the cost of installing the batteries in the telephones.

It is not uncommon to find telephones fitted with older transmitters where the cost of the current waste, because of one receiver off the hook, exceeds that of burning three 25-watt lamps at 10 cents per kilowatt-hour.

THE KELLOGG SWITCHBOARD & SUPPLY CO., of Chicago, is advising telephone companies that it has a remedy in a battery saver that is new and certain in service, is purely mechanical, can be installed by anyone on any Kellogg telephone, and is the final solution of battery waste. Furthermore, the cost of installing the battery savers is nominal. The battery saver consists of one piece and one attaching screw.—*Telephone Engineer.*

The R.B. "Adamant" Electric Pipe-Lighter.

This device, which has been put on the market by MESSRS. ROSE BROS., of 25-27, Milton Street, E.C., is the outcome of efforts to produce an electric pipe-lighter that will stand up to the every-day usage of the smoke room to which these lighters are subjected. The name "Adamant" has been given to it owing to the burner (patented) with which the lighter is fitted. This burner looks like a disk of stone, which is set in the end of a metal tube. The burner becomes red-hot in about four seconds after switching on the current, the consumption being 1.2 amperes. The burner will not burn out whilst one watches it—on the contrary, it will run for hours: hence continual replacements are not necessary. It will work on either direct or alternating current, the standard voltages ranging from 100 to 250 volts. It is small and compact, having an outside diameter of only half an inch, enabling it to reach down readily to the bottom of a pipe. The lighting of a cigar or cigarette offers no difficulty. The lighter also has the further advantage of not presenting a great volume of heat near the face of the user.

The "Adamant" pipe-lighters are made in two classes, the wall set and table set, and are connected by flexible cord to a plug for a wall socket or an adapter for a lamp.

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C. 4.

Telegraphic Address: "AGEEKAY, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 6d.; Canada, £1 3s. 10d. (\$5.80). To all other countries, £1 10s.

THE ENGINEER AND THE NATION.

FOLLOWING closely upon the call of the President of the American I.E.E. to the engineer to take his rightful place in national affairs, upon which we commented last week, we find in *Industrial Management* a spirited appeal by Mr. C. E. Knoeppel to every industrial engineer to do his part in the national crisis. The author recognises the immense importance of the rôle that the United States is called upon to fill in the winning of the war; he quotes Mr. H. E. Coffin, of the Council of National Defence, as saying:

"Who is there better fitted by technical training and by life experience for leading the way to this new era of Universal National Service than American engineers? Will vision come to them? Will they translate vision into action—and will they *do it now?*" and after referring to the nation's debt of gratitude to those engineers who have so far given freely of their time, he says:—"The time has now arrived, however, for the Industrial Engineers of the country to step forward, and, in this crisis, as well as during the *post-bellum* period, take their appointed place in the direction of large affairs both governmental and industrial."

Last week we drew attention to the formation of the Engineering Council, which is intended to enable all American engineers to co-operate with the greatest efficiency; Mr. Knoeppel points out that on May 26th the Society of Industrial Engineers was organised, as the outcome of a national conference held to consider the question of industrial preparedness, and he claims that the steps then taken will not only make history, but will put the United States in a better position to wage a decisive and victorious war. The new Society was organised to serve a two-fold purpose: (1) To provide a vehicle whereby the best minds can be enlisted to aid the Government in its present hour of need; (2) generally to promote efficiency and industrial management.

The programme of work which the author subsequently outlines is practically identical with that which has been imposed upon this country, and he remarks, in accord with the Executive Committee of the U.S. National Chamber of Commerce, that these things will have to be done quickly. If any one of various possible eventualities should compel the European Allies to abandon the struggle, the United States would have to bear the brunt of the fighting on her own shores, single-handed, and she "would have to win, or the world would be a worse place to live in than Hell itself." Speedy action is therefore imperatively necessary. But, says the author, "the opportunity before the industrial engineer is not narrowed to the industrial field by any means. *He is needed in the conduct of governmental affairs.*"

We need not follow the details of the new organisation; our aim is to focus attention upon the vast movements in progress in the United States, the complete change of attitude towards the rest of the world, the adoption of new ideas and motives of action, as typified in these great movements in engineering circles, and to suggest again that there is a lesson to be learnt by us from them. British engineers have rendered priceless services to their

country and the world in this great crisis; but have they done all that they could have done if they had been better organised? Assuredly not. The difficulties which have been experienced by individual engineers and scientists of the highest standing in securing opportunities to utilise their knowledge for the benefit of the nation are notorious, and even now our engineering resources are not fully developed. Efficiency should be our watchword, co-ordination and concentration of effort our method of attaining it; we need a national engineering organisation which shall not only assist the Government in every possible way during the war, but which also shall promote industrial efficiency after the war. It rests with our leaders to lead.

Reasonable Recruiting. WE have heard many complaints from men in the engineering profession as to the methods in which they have been posted haphazard to any unit, irrespective of their qualifications. We have always believed in the policy of the right man in the right place, and we can only see a loss of efficiency in the Army if men of technical or administrative qualifications are posted without regard to those qualifications. There should be room for technical men in technical posts, and men who have done administrative work are surely men who are fitted to be officers. A friend of ours, an M.I.E.E., &c., &c., spent many months, as he termed it, "muck-shifting," and only his own perseverance brought his technical training to light—or, rather, recognition—and raised him to the rank of Captain in the R.E. That is one case of many where talent has been wasted. There seems to be an impression that the ordinary Officers' Training Corps—such as the Inns of Court and the Artists' Rifles O.T.C.—are no longer open to recruits. This is not so; we have heard of several of our friends who have joined these Corps recently, and they tell us recruiting is going on at the rate of several hundred a month. These are the Corps which those should join who have during the past three years been holding the responsible posts in manufacturing munitions, but who are now able to get released by their various employers. Had they been able to leave two years ago, they might now have been holding commissioned rank, and doing sterling work, instead of being liable to find themselves drafted off to positions where their talents are wasted, though they are eminently fit for commissioned rank.

Reconstruction. In our opinion, the appointment of Dr. Addison as Minister of Reconstruction is one of the most important steps that the Government has taken to prepare for the after-war situation. During the past year or two there has been no end of inquiry and investigation work done by committees and departments, and the material collected must reach considerable proportions in the mass. Some of it, no doubt, has been well sorted out and sifted already, but it is quite the right thing to appoint a whole-time Minister to guide the Cabinet and the nation concerning the measures which may reasonably be required to emerge. Dr. Addison has been so closely in touch with industrial matters during his period at the Ministry of Munitions that his appointment as Minister of Reconstruction may be regarded as a satisfactory one. He knows as well as anybody how great has been the disorganisation of industry during war-time, and he may be credited therefore with a correct appreciation of the great problems that will arise as demobilisation of industrial workers under coming conditions takes place. His address at a conference with leading representatives of the chemical industries of the country last week shows that he appreciates fully the immediate

need of essential raw materials when Peace comes (he indicated a possible shortage even before that event), and the necessity for our increasing the product of all our industrial plants. He is not blind to what the enemy is doing by way of preparation, and he recognises that unless we take time by the forelock we may find ourselves short of essential materials. He asked for the co-operation of the chemical industries, so far as they are concerned in the matter, in taking the necessary steps in time. He proposes to get to work to examine the problems of reconstruction fairly and squarely, utilising the information already gathered together by committees, in order that steps may be taken to mitigate the evils of the reconstructing period by putting some British industries on a much firmer and more scientific foundation. Manufacturing methods must be brought up to the highest pitch of perfection, and better understandings with Labour will make possible the introduction of the improved methods needed to secure that end. We do not think that Dr. Addison will find industry slow to co-operate with him in the great task that he has undertaken.

War Effects on South African Trade. THE report recently issued by the Board of Trade from the pen of H.M. Trade Commissioner in South Africa (Mr. W. G. Wickham), although described as dealing with trade in that territory for the years 1915 and 1916, contains much of interest and value relative to present conditions and future prospects. The portions of chief interest to the electrical and allied trades are summarised in another column. Mr. Wickham rightly points out that it is an open question at least whether annual reports which are merely chronicles of past facts are of value, except in so far as inferences can be drawn and advice extracted for the guidance and increase of future trade. In Mr. Wickham's report, however, it is possible to do a great deal in this direction.

In interpreting the statistics of South African shipments, it must be kept in mind that the high prices offered for commodities, particularly from the United Kingdom, have given an inflated appearance to exports in relation to values of previous years, and they may have provided inducement to export in lines where there was no surplus, and even lines in which there had been little or no production before the war. And as regards imports to South Africa, Mr. Wickham considers that while the high prices ruling have given an appearance of normal or even abnormally large importations, in reality many factors have been at work to cause the market to absorb considerably less in quantity than usual—namely, difficulties in getting freight space, abnormally high freight rates in addition to high prime cost, prohibition of exports from other parts of the Empire, and dear and scarce money, resulting in postponement of public works and private enterprise. On the other hand, of course, the war has created an artificial demand for certain kinds of supplies for public purposes, to the obtaining of which, as necessities for war, there was no official obstacle.

In Mr. Wickham's view, it will be some time before Japan is looked to as a supplier of iron and steel and machinery, but he expects to find that enormous strides have been made during the war as the result of supplying a large proportion of Russia's war needs. This view is, of course, supported direct from Japan itself, although, as yet, it is only in the lighter descriptions of electrical goods that its competition on the world's markets has made itself at all keenly felt. As regards Japanese trade in South Africa, the machinery for development was already established in the form of agencies and branches of merchant houses from Japan. The diversion of Japanese liners from the Suez

Canal route to the Cape provided direct steamer communication.

On the subject of competition and future trade generally, the note that the Trade Commissioner strikes is one that has been frequently sounded in these pages, viz., that even if producers are so busy on work of greater and more immediate national importance that they cannot make goods, or even show samples and catalogues for overseas trade, it is nevertheless imperative that they keep their goodwill alive and have their export organisation ready primed for quick and active operation directly Peace is declared.

The I.M.E.A. and Electricity Supply.

ONE or two items in the proceedings of the recent annual meeting of the Municipal Electrical Association served to focus the attention of interested circles on the attitude of the ruling members of this guild in regard to the great question of electricity supply reorganisation on a national basis. We referred to this matter at the time, when it was urged that the Council of the I.M.E.A. should come out into the open and place its views on the future of electricity supply and the rôle of the municipal authority in connection therewith before its members—a resolution to that effect being adopted.

We do not know that there was any suggestion that the Council had not made up its mind on the subject, but those who are well able to judge have felt that the important interests represented by municipal supply authorities were likely to suffer if some definite pronouncement as to the views and policy of the Association was not very quickly made.

In this connection, the circular letter which has just been issued by Mr. H. Faraday Proctor, the hon. secretary of the Association, and which appears elsewhere in this issue, is no doubt intended to clear the atmosphere. It contains a synopsis of the views of the Council, expressed in general terms, which include the appointment of a Central Board of Control, subject to Parliament alone, composed of whole-time officers, to exercise the present functions of the Board of Trade, Local Government Board, Home Office, and other departments which at present have a finger in the electricity pie; also the supply of electricity from large power stations controlled and operated by District Boards consisting of representatives appointed by the present statutory undertakings, both local authorities and companies, the distribution remaining with the present undertakers. For the rest, the report of the Lancashire and Cheshire Linking-up Committee, which we note "will be published within a few days," may be expected to shed some light on the working details of the scheme as applied to one of the most important industrial areas of the country.

Meanwhile, we share with the Council its regret that full information cannot be imparted at the present time owing to the withholding by the Government of the report of Sir Charles Parsons's (Electrical Trades) Committee and the interim report of the Coal Conservation Sub-Committee; why the former is wrapped in mystery we do not know, but the latter, at any rate, has passed beyond any particular claim to secrecy. We welcome the plain statement of its views by the I.M.E.A. Council, and the prospect of studying the suggested application of the principles outlined by it to the Lancashire and Cheshire area. It is not so much in the general features of reorganisation on broad lines that divergencies of opinion occur as in the details, and the carefully prepared scheme of the Lancashire and Cheshire engineers—both municipal and company—should carry far more weight in responsible circles than a settlement arrived at by a Government Committee which is shrouded in secrecy.

SOME NOTES ON DIVING-BELL COVERS FOR DISCONNECTING BOXES.

By G. W. STUBBINGS.

THE diving-bell cover for disconnecting boxes is a most useful device, combining, as it does, a high degree of safety with the maximum of convenience for disconnecting. The time spent in removing nuts from a cover of the bolted-down type is considerable, and, in times of trouble, the advantage in this respect of a diving-bell lid, which has simply to be lifted off, and, after disconnecting, as simply put back, is incalculable. A properly designed diving-bell cover should, moreover, be quite watertight, and thereby escape the uncertainty that always attaches to bolted-down joints for box covers. Cases have from time to time been met with of the failure of diving-bell covers owing to the seal being insufficiently deep, and it will, therefore, be useful to investigate the criteria to which the dimensions of such covers must conform to be successful in given conditions.

For purposes of calculation, a box of simple shape, such as that shown in the diagram, may be taken. If u be the difference in level of the water in the pit and in the sealing

SECTION OF BOX WITH DIVING-BELL COVER.

space of the cover, h the height to which the water has risen in the bell, h^1 the depth of the sealing space, A the atmospheric pressure expressed as a head of water, and the joint be watertight—

$$h/h^1 = A/(A + H),$$

and, whatever the pressure of the submerging water might be, the water in the bell would never reach the joint. The joint, however, is not watertight, and will not be able permanently to sustain a difference of pressure between the interior of the box and the upper part of the sealing space, and the water will accordingly rise in the bell to a considerably greater height than given by the above expression.

Calling the volume of the air space in the box v , and the volume of the annular sealing space v^1 , the new conditions can be stated—

$$A(v + v^1) = (A + H)\{v + v^1(h^1 - h)/h^1\},$$

which finally reduces to—

$$h = h^1 H (v + v^1)/(A + H) v^1.$$

There is, however, a further factor to be taken into account. The most dangerous and trying conditions to which disconnecting boxes can be subjected, are undoubtedly those of sudden storm after a spell of very hot weather. In these circumstances, a pit may be flooded with very cold water, and the temperature of the box, which may have been considerable, will be suddenly reduced. Such a reduction in temperature will cause an appreciable lowering of the air pressure inside the box, causing the water to rise higher in the bell than otherwise.

Calling the absolute temperatures of the box before and after flooding T_1 and T_2 respectively, the conditions can now be stated—

$$A(v + v^1)/T_1 = (A + H)\{v + v^1(h^1 - h)/h^1\}/T_2.$$

Putting $T_1 - T_2 = t$, this finally reduces to—

$$h = h^1 (v + v^1) (T_1 H + t A)/(A + H) T_1 v^1.$$

The writer selected at random from the catalogue of a good manufacturer of cable accessories, a line diagram of a four-way box, and scaled off the dimensions. The interior of the box is approximately 20 in. \times 14 in. \times 4 in., the

sealing space being $1\frac{1}{4}$ in. wide by 2 in. deep. Assuming h to be 12 in., T_1 20° C., and t 10° C., the above expression gives a value for h of $\frac{7}{8}$ in., a result that can be considered satisfactory.

For given conditions, v and r remaining constant, it is seen that $h = b h^1$, the distance between the level of the water in the bell and the joint is $h^1 - h$, and calling this distance h_2 ,

$$h_2 = h^1 (1 - b).$$

This margin of safety h_2 is therefore proportional to h^1 , r remaining constant. It therefore follows that it is better to have a deep and narrow seal than one shallow and broad, as inaccuracies of levelling the box will be of smaller importance. The matter of correct setting is one of considerable importance, as the sealing effect of the bell does not commence until the lower edge is completely immersed; and with a wide and shallow seal and a large box inaccurate levelling might lead to serious trouble.

Referring to equation—

$$h = h^1 (v + r) (T_1 H + t A) / (A + H) T_1 r,$$

the worst conditions to which the box will be subjected may be assumed, and the equation may be rewritten—

$$h/h^1 = c (v + r)/r,$$

enabling the relation between v and r to be calculated for a given proportional rise of water in the bell. Putting $h/h^1 = m$, this equation becomes—

$$m = c (v + r)/r,$$

and finally—

$$v/r = (m - c)/c,$$

giving the relation between v and r and m for any given conditions. For the purposes of a numerical example, the former values of H , T_1 , and t may be taken, the corresponding value of c will be 0.0633. If it be considered that under these circumstances the water should not rise more than halfway in the bell—

$$v/r = (5 - 0.0633)/0.0633 = 7 \text{ approximately,}$$

and the volume of the air space in the box should not be more than seven times the volume of the annular sealing space.

The above reasoning shows further the importance of setting the box accurately level, as inaccuracies will not only, as before pointed out, diminish h^1 , but will also diminish r , this volume, of course, being calculated as lying above a horizontal plane touching the highest point of the bottom of the bell. The writer has calculated the effect of $\frac{1}{8}$ in. out of level in setting the four-way box already referred to, and finds that this inaccuracy will diminish the safety margin from $1\frac{1}{8}$ in., as before calculated, to $\frac{7}{8}$ in.

JAPAN'S PROGRESS IN THE ELECTRICAL INDUSTRY.

BY MALCOLM CHALMERS.

Prior to the war Japan used to import considerable quantities of electrical machinery, apparatus, and materials, the total value of which in 1913 amounted to about £790,000. The war has, however, given Japan her opportunity, which she has not failed to put to account. She has turned her attention to the manufacture of this class of goods, with the result that her imports in 1916 were no greater than £320,000, a decline of 60 per cent. Even this does not represent the full facts, for in 1916 there was a special import of submarine cables valued at £132,000, as compared with £5,000 only in 1913. Leaving this out of account, we find that the imports of other electrical goods were valued at £188,000 in 1916, as compared with £785,000 in 1913, a decrease of 76 per cent. This year the decline has been maintained, the imports for the four months ended April being valued at only about £72,000 in all. The following statement gives the details for the various classes of goods in 1916 as compared with 1913:—

	1913.	1916.
Materials for suspending electric lines	£4,000	—
Submarine cables	5,000	£132,000
Insulated wire, other than cables	206,000	2,000
Meters:—		
Amperemeters and voltmeters	21,000	7,000
Wattmeters	27,000	13,000
Other kinds	16,000	9,000
Accumulators	25,000	1,000
Telegraph and telephone instruments	8,000	6,000
Dynamos, electromotors, transformers, converters, and armatures	374,000	40,000
Dynamos with motive machinery	65,000	45,000
Filaments for incandescent lamps	8,000	63,000
Incandescent lamps	30,000	2,000

Turning now to the export trade, we find that in 1913 Japan exported electrical goods to the value of less than £80,000, whilst last year her exports in this line were valued at no less than £421,000, or over five times as much. In the first four months of this year, moreover, the increase was more than maintained, the exports for that period being valued at £260,000, or at the rate of over three-quarters of a million sterling per year. The details of the exports so far as available in 1913 and 1916 are as follows:—

	1913.	1916.
Insulated wire...	£26,000	£115,000
Electrical machinery	48,000	147,000
Telephones	5,000	92,000
Incandescent lamps	—	67,000

Perhaps the most noteworthy feature shown by the above figures is that relating to incandescent lamps. In 1913, Japan imported £30,000 worth of these lamps and exported none, whilst in 1916 her imports were practically nil and her exports were valued at £67,000. In the four months January-April, 1917, the exports of electric lamps were greater than during the whole of last year, being valued at £84,000, or at the rate of £250,000 per annum.

It will be interesting to see, when peace is concluded and the manufacturing nations now at war are able to compete once more, whether Japan will be able to hold the position she is fast building up for herself in the manufacture of electric lamps. Everything points to the fact that she will, for some excellent modern factories have been erected, and with an abundance of cheap labour and of cheap power derived from the numerous waterfalls of the country, she should be well able to hold her own in the matter of price. Possibly the principal deciding factor will be the question of filament. As will be seen from the fact that £63,000 worth of filament was imported in 1916, Japan has hitherto been dependent on outside supplies for this material. Efforts are being made, however, by Japanese manufacturers to make the country independent of foreign supplies in this respect, and it would appear that they are succeeding in their efforts, for during the first four months of the present year, when more lamps were exported than during the whole of 1916, the imports of filaments were only valued at £17,000.

COAL CONCRETED FROM DUSTS OR ASHES.

IN a second paper read before the Society of Architects on this subject (see ELECTRICAL REVIEW, June 29th), Mr. R. Goulburn Lovell said that the process of manufacture would be demonstrated, and that the analyses of the component parts and the resultant fuel would be shown.

There were three methods of making the fuel, which might be called A, B, and C. A and B might be termed dry processes. In this case they took as aggregates ashes and coal dust. After sifting the fine dust, which was of little or no value, the coarse aggregate was composed of all between $\frac{1}{4}$ and $\frac{1}{8}$ in. mesh. This was dried, sprinkled with a special sugar-waste solution, and again dried. The fine aggregate was taken from the coal-cellar dust, only that which passed $\frac{1}{8}$ -in. mesh being used. These two bases should be intimately mixed with the matrix or binder.

Up to this point A process and B process were exactly the same. Process A was employed wherever the sun had much value, or where the heating chambers were available. The mixed aggregates and binder had in some cases a small quantity of creosote oil added, it was then placed in moulds and allowed to concrete, the time varying with the amount of heat available. The fuel, when cold, was emptied out of the moulds, broken up, and hardened by exposure to the atmosphere.

With process B, the small quantity of creosote oil, if used, was placed in a boiler or an iron saucepan, the mixture of bases and matrix was added, and placed upon a fire and stirred until a temperature of about 120° F. was obtained, when the whole was emptied into any mould, such as an old pail. In a short time it was cold, and was broken up and allowed to harden.

Process C was a wet process, in which there was no need to dry the aggregates. They were mixed as before, but with a different matrix mixture; the creosote oil, if used, was added and well mixed, the whole was then moistened with the solution until a consistency of mortar or concrete was obtained. It was then emptied into shallow moulds, or between sheathing boards, and dried by exposure, but with protection from the wet.

In all three processes the character of the matrices varied with the character of the aggregates, and the different aggregates had to be treated by different methods. It was usually found that in most cases the smoke of the resultant fuel could be diminished by an increase of the remaining ashes; in the case of furnace fuels the clinkering could by this means be diminished. This method of concreting fuel dispensed with any kind of pressure beyond a slight tamping into the moulds. For low-grade coals, coals, or bar ashes process A was the best method.

Process B was suited for any form of rotary asphalt plant, either fixed or movable. For all materials high in carbon but low in volatile matter, process B was the best method.

Process C was the cottager's process of producing coal in his own back yard. It would be better for a community to send its ashes and dust to a central depot, and there have it done under proper supervision, but there was nothing to prevent an isolated individual or firm from utilising their waste materials by this process. For high-grade coals, high-grade bituminous coals, or a mixture of the latter with ashes, peat, sawdust, &c., process C was the best method.

The analyses of seven different types of fuel made under the three processes, together with the calorific values of their component parts, were given showing for coal dust fuel from 10,000 to 12,570 B.T.H.U., and for ashes and coal dust, &c., from 5,000 to 9,000 B.T.H.U.

The percentage of raw material in the resultant fuel was from 91 to 99.58 per cent.

Samples of the resultant fuel were shown in each case; they would light from the sticks, incandescence, and flare.

There were many collieries where fine coals were produced in abnormal quantities, due to unusual friability; as, for instance, the Kent coal. It was there demonstrated that by their process fuel could be economically made equal in value to the large coal worked in the same seams.

The briquetting method of utilising coal slack required costly machinery and plant, and the slack had to be transported to the briquetting factories. The concreting process, on the contrary, enabled the simple machinery and plant to be taken to the dumps of slack, thus saving handling and transportation. The concreted fuel was manufactured *in situ*. Further, it was submitted that a better fuel was produced.

USES OF MAGNETIC SEPARATOR PULLEYS.*

Magnetic separator pulleys have been put to work in an increasingly large number of industries during the past 10 years. They are useful wherever it is desired continuously to remove the magnetic content from non-magnetic bulk material. For example, they are used with success in removing pickheads, coupling pins, &c., from coal passing to a crusher which would be damaged by the entrance of such material. They are used for similar purposes at phosphate rock mines and quarries. In the production of sulphite fibre paper stock, they are used to remove scrap iron and steel from the wood chips before these are delivered to the sulphite tanks. They

FIG. 1.—PRINCIPLE OF MAGNETIC SEPARATOR PULLEYS.

are also used in the production of cement, gypsum, limestone, clay for terra-cotta manufacture, as well as in the freeing of grain, spices and tobacco from bits of iron or steel before grinding. They also find employment in city refuse-disposal plants, for removing tin cans, horse-shoes, nails, &c., from the worthless material.

Magnetic separators are in use in a large number of sugar plants to remove iron rust or iron oxide from animal charcoal, which is collected by it while passing through the ovens and being baked. This baking process is necessary to eliminate from the

charcoal the impurities which it has absorbed from the sugar. The magnetic material is especially prevalent after the retort has been repaired. Under ordinary conditions, the magnetic pulley is energised only part of the time, two weeks out of a month or so, this being sufficient to keep the iron oxide out of the bone charcoal, so that trouble with iron colouring in the sugar is prevented.

The use of powdered or pulverised fuel has been extended, and this has led to the need of magnetic separators in cement plants, steel plants, power houses, and many other kinds of plants. Coal, as delivered to the milling plant, always contains an astonishing amount of iron in the form of bolts, nuts, rivets, nails, bar iron, railroad spikes, mule shoes, &c. Any of these materials entering the crusher or pulveriser might result in damage to the machine, with consequent delays in operation.

This foreign magnetic material can be entirely eliminated by the use of a magnetic separator located at some point ahead of the crusher. When the material passes over the separator pulley, which contains the magnet, the magnetic material is attracted and held firmly against the belt, and remains in contact with the belt until it leaves the magnetised zone, which is at some point beyond the under side of the magnetic pulley. The iron drops from the belt after it leaves the pulley, and is delivered to suitable boxes by means of a chute, the coal continuing on its course.

The pulley is magnetised by passing direct current through windings in the interior of the pulley.

In a letter to the editor, Mr. A. C. Daman states that in Colorado hundreds of tons of tungsten concentrates and middlings are annually treated over the Wetherill magnetic separator. In some cases, concentrates have been increased from 10 to 65 and 70 per cent. tungstic acid, and where pyrite is associated with ferberite, magnetic separation is indispensable.

During the last three or four months the writer has tested hundreds of tungsten ores magnetically, and success was obtained on practically all of them. It was proved that the magnetic separation was a commercial success, and in several instances the only salvation in saving the values.

ELECTRIC SMELTING OF IRON ORES.

A RECENT issue of the *Jern-Kontorets Annaler* reproduces in a slightly abridged form a Memorandum drawn up by Mr. J. A. Leffler, in which he investigates a proposal put forward in March, 1916, by the Committee appointed by the Administration of the Association of Swedish Technologists to install electric furnaces in the North of Sweden for smelting pig-iron. The Committee recommended the installation of four plants, with six furnaces in all, to produce 65,000 to 70,000 tons of pig-iron per annum, using from 110,000 to 120,000 tons of ore and about 25,000 tons of charcoal.

In his investigation the author makes, among others, the assumption that to smelt one metric ton of pig-iron from the Luleå or Gellivare ores, 1.6 ton of ore and 0.4 ton of charcoal are required, and 0.272 kw.-year of electrical energy. As explained by him in detail, such a low consumption of energy can only be attained by installing four furnaces of a total of 9,000 kw., one as a stand-by and three working continuously, as this would make it possible to utilise 92 per cent. of the purchased power, while with one furnace only the useful percentage would only be 83 per cent., which is the average result attained during the three years' working in 1913-15 at the *Jern-Kontorets* experimental plant at Trollhättan. There must be, however, a misprint in the figure given for the output of this plant for 1915: it should be 7,502 tons, instead of 7,052 tons, to make the author's calculations correct. The capital outlay at Luleå would be about £85,833 for the plant itself, and about £20,833 for dwellings for officials and workmen, while for Gellivare the corresponding figures would be £94,444 and £23,333 respectively. There would be 6 officials and 75 workmen, with their foremen, and the assumed output at each place would be 30,000 metric tons per annum. For the cost of production of one metric ton of electric pig-iron, the author submits the following estimates:—

	At Gellivare.	At Luleå.
1.6 metric ton of ore*	£0 18 3	£1 1 7
Limestone	0 0 8	0 0 5
0.4 metric ton of charcoal	1 0 10	0 18 1
0.272 kw.-year	0 14 5	1 0 1
Electrodes	0 1 10	0 1 8
Repairs and upkeep	0 3 8	0 3 4
Wages	0 6 6	0 5 5
Management and sundries	0 2 3	0 1 11
Royalty	0 1 5	0 1 5
Sinking fund	0 3 7	0 3 3
Rents	0 5 9	0 5 5
Carriage to Luleå	0 1 10	
Total cost	1 4 0	1 2 10

* 50 per cent. of ore and 50 per cent. briquettes.

The freight from Luleå to Gävle, and unloading the iron into railway trucks, would cost another 4 kr., say, 1s. 6d. per ton. It would thus be seen that the northern pigs would cost at Gävle about £4 8s. per ton, and, therefore, could not compete with the pig-iron obtainable there from the blast furnaces at 65 to 70 kr. (about 72s. to 77s. 6d.) per ton for basic, and at 70 to 75 kr. (about 75s. 6d. to 83s.) per ton for acid open-hearth pig-iron.—*Iron and Coal Trades Review*.

THE SPRING LAKE MARINE RAILWAY.

IN the *General Electric Review*, Mr. JACOB A. HARMAN, chief engineer, Elliott & Harman Engineering Co., Peoria, Ill., gives an account of the Spring Lake Marine Railway, which is a system designed to serve the same purpose as a marine lock, but to cost less, and to be maintained at a lower expenditure.

The railway, located in the Illinois River valley about 30 miles below Peoria, was built by the Spring Lake Drainage and Levee District, an authority organized under the Laws of Illinois, for the purpose of reclaiming about 14,000 acres of land that was subject to overflow by the Illinois River. The district, as organized, included a body of water known as "Spring Lake," which was shut off from communication with the Illinois River by the levee or dike constructed by the Drainage District.

It was at first contemplated that a lock should be constructed for the purpose of communication between the river and the lake, but the cost of the construction and maintenance thereof would have been burdensome, and approval was obtained for the construction of the marine railway. The electric power for operating the mechanism is supplied from the power plant of the Canton Gas & Electric Co., at Canton, Illinois. The transmission line, about 20 miles long, is a 13,000-volt line, and also supplies electric current for the Banner and the Spring Lake Drainage Districts pumping plants. The railway and the pumping plants were designed by and constructed under the supervision of the Elliott and Harman Engineering Co., consulting engineers.

In general, the marine railway consists of an incline track leading up each slope of the levee to a turn-table located on the summit of the embankment. A cradle, or boat carriage, is

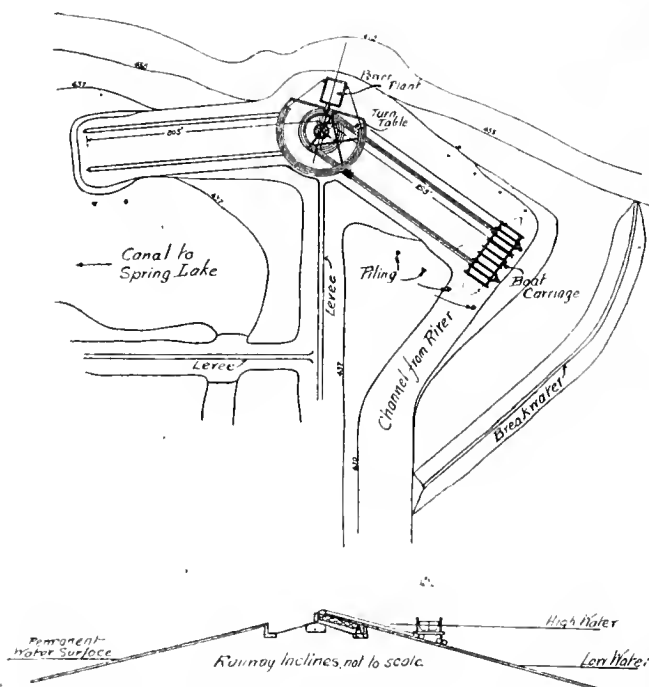

FIG. 1.—PLAN AND ELEVATION, SHOWING LAY-OUT OF MARINE RAILWAY.

mounted on wheels so that it can be lowered on these inclines into the water to receive the boats, raised to the turn-table, rotated thereon, and lowered to the water again on the opposite side of the levee, keeping the boat in its natural position throughout all these operations. An electric hoisting engine for hoisting and lowering the boat carriage, and an electric swinging engine for rotating the turn-table, are housed in a reinforced concrete building alongside the turn-table.

The marine railway mechanism is designed on the basis of handling as a maximum load a flat-bottom barge, or power boat, 24 ft. wide, 120 ft. long, and having a draught of 3 ft. 6 in.; the cradle, however, as designed is sufficiently wide to accommodate shorter boats of a maximum width of 28 ft. Smaller boats, barges, and launches can also be handled. Each incline consists of two standard gauge railroad tracks, laid parallel, and spaced 50 ft. centre to centre, the gradient of the tracks being 10 per cent. These tracks extend from the turn-table down into the water on each side of the levee to a depth sufficient to have 4 ft. of water over the floor beams of the boat carriage at the low-water stage. The rails used for all tracks are 120-lb. standard T-rail sections, and are laid on cross-ties. The circular rails on which the turn-table moves are mounted in a concrete pit, 115 ft. in diameter, upon a heavily reinforced concrete foundation of the slab type.

The cradle, or boat carriage, is a steel structure mounted

on wheels. The trusses are 80 ft. long and 10 ft. high, with a clear opening between them of 30 ft. The fixed floor beams are arranged in pairs, and between each pair is mounted a heavy movable beam which can be adjusted to fit up snugly against the bottom of the barge or boat in its natural position. These movable floor beams are hung on heavy threaded rods, which extend upward through the upper chord of the truss, at which point the rod is suspended from the top of the truss by means of a split nut with four handles resting on a short coil spring. There is also provided a winch adjustment for each of these rods for raising the beams rapidly to position, after which the split nut is closed and the beam is brought up close by the use of the nut. This boat carriage is supported on two specially constructed eight-wheel trucks of a heavy type, the mounting being arranged so that the

FIG. 2.—INDUCTION MOTORS DRIVING A HOIST AND A SWINGING CABLE DRUM.

floor of the boat carriage is always in a horizontal position. Each of these trucks is provided with special draw bars, to which are attached the steel haulage cables used for raising and lowering the boat carriage on the inclines. Each truck is also provided with a system of brakes which may be set by hand, and which are so constructed as to be set automatically by a coil spring whenever the tension of the haulage cables is released.

The power and hoist equipment consists of two electrically-driven hoisting drums, one for raising and lowering the boat carriage on the inclines, and the other for rotating the turn-table. The main hoist drum is driven through a train of spur gears by a 75-h.p. (intermittent rating), 600-R.P.M., 440-volt, 3-phase, 60-cycle, slip-ring type induction motor with a reversible drum type controller mounted on the operating platform. The travelling speed of the main haulage cables is approximately 16 ft. per minute. The brake drum is 10 ft.

FIG. 3.—BOAT CARRIAGE ON TURN-TABLE.

in diameter, with a 14½-in. face. This brake is applied by means of a system of heavy weights and levers, and is released by raising the weights with a drum and wheel hoist mounted on the operating platform. A pawl and ratchet device on this hoist keeps the brake mechanism in the released position after the weights have been lifted by the hoist. This pawl and ratchet device may be tripped, thus applying the brake on the main drum, by four independent agencies: (1) By means of a foot trip, mounted on the operating platform; (2) by means of a ratchet device, which engages the teeth of the large gear when the cable starts to unwind, thus automatically setting the brake; (3) by a centrifugal governor, which automatically sets the brakes should

the speed of the boat carriage exceed the predetermined speed of 16 ft. per minute; and (4) by an electric solenoid device, which automatically sets the brake in case the supply of electric current should be interrupted. Device No. 2, which automatically sets the brake when the cable starts to unwind, is made inoperative when lowering the boat carriage by means of a foot pedal on the operating platform.

The turn-table swinging engine consists of a drum driven by an 18-h.p. induction motor with a reversible drum-type controller mounted on the operating platform. The brake on this engine is operated by a hand lever mounted on the operating platform, and the travelling speed of the cable, which is hitched to the outer trucks of the turn-table, is 20 ft. per minute.

There are three special indicators to aid in the operation of the apparatus.

In conclusion, the following data concerning the marine railway will be of interest:—

Maximum lift of railway, 27 ft. vertical.

Estimated maximum weight of boat carriage and boat, 800,000 lb.

Largest boat that it is calculated to carry, length 120 ft., width 24 ft., draught 3½ ft.

Distance between centres of incline tracks, 50 ft.

Slope of tracks, 1 ft. in 10.

Estimated maximum pull on haulage cables, 100,000 lb.

Speed of boat carriage, 16 ft. per minute.

THE ELECTROLYTIC TREATMENT OF ZINC ORE.*

At a recent meeting of the AMERICAN CHEMICAL SOCIETY a paper was read by Mr. E. E. WATTS on this subject. He said that the war had given a great impetus to the zinc industry, and much attention had been directed to the treatment of complex ores by hydrometallurgical and electrolytic processes.

In 1912 and 1913, at the School of Mining, Kingston, the writer experimented with zinc ore from the Sullivan Mine, of Kimberley, B.C. The ore was a dense complex sulphide.

Tests were conducted to determine if it was possible to obtain metallic zinc by the electrolysis of solutions of zinc bisulphite. The deposition of the sulphur and zinc sponge, and the evolution of hydrogen sulphide made this electrolysis impossible. Attempts to obtain metallic zinc by electrolysis of solutions of zinc sulphate to which zinc sulphite precipitate was periodically added showed that in the presence of sulphurous acid or zinc sulphite successful electrolysis was impossible.

Tests were conducted in which the zinc sulphite precipitate was first roasted to oxide before charging at the anodes in a zinc sulphate electrolyte. Successful results were obtained. The zinc deposited in a good plate, and the electrolyte was maintained by the addition of the roasted sulphite. To free the bath from particles of precipitate that might attach themselves to the deposit, to place the roasted precipitate at the point in the bath where the sulphuric acid was regenerated by the electrolysis, and to decrease, if possible, the decomposition voltage by allowing the roasted precipitate to act in part as anode, the crude zinc oxide obtained by roasting the zinc monosulphite precipitate was placed in bags at the anodes of the electrolytic cell.

From the foregoing experiments the following conclusions were deduced:—

Lead forms a satisfactory anode, and copper, zinc, and aluminium form satisfactory cathodes.

With current densities of from 2.5 amps. per square decimetre to 4.5 amps. per square decimetre, a current efficiency of approximately 100 per cent. can be maintained.

Depending upon the current density, the voltage varies from 3.5 to 6 volts.

The extraction of zinc from zinc oxide varies from 95 to 100 per cent.

The process, as outlined, was patented, and was developed for the treatment of high-grade zinc ore. The process has been referred to as the Watts Process.

The high-grade zinc product for charging to the electrolytic cells may be roasted zinc concentrate, impure or refined zinc oxide, or zinc dust. The advantages of such a treatment are:—

1. The solution is kept small in bulk and the solution and tanks serve at once for leaching the ore and for electrolysis.

2. The acid generated at the anode is immediately used up at the point at which it is generated, and at the point where it is most concentrated, and hence most active. Thorough extraction is thereby obtained.

3. The bath is automatically kept at constant composition and purity, zinc goes into solution with the relative exclusion of impurities.

4. The zinc content of the solution is kept constant, and high-current efficiency is therefore maintained.

5. The conditions are fulfilled for obtaining a good cathode deposit.

6. The residues from electrolysis may be further treated for the recovery of other metals.

The writer became connected with the Weedon Mining Co., and in August, 1915, work was started on an experimental plant at Welland, Ont.

With two anodes per tank, with the compartments surrounding the anodes, and with a current of 950 amperes per tank, corresponding to a current density of 12.5 amperes per square foot, good results were obtained.

Several expedients were tried for keeping the solutions cool when employing higher currents, but the heat resulting in part from the electrolytic resistance and in part from the chemical reaction at the anode, made higher currents impracticable with this form of tank.

Considerable difficulty was also experienced with the compartments, for the canvas used as a diaphragm material developed into a serious weakness, and required constant attention and repairs.

In general, the laboratory experimental results were attained, but the operations did not permit of a sufficient margin for profit. The company did not see its way clear further to perfect the details of the process on a large scale, so the plant was closed in August, 1916.

When producing zinc at the rate of 8,000 lb. per month, the cost of producing zinc was as high as 18 cents per lb. plus the cost of the ore. On the basis of a steady production of 60,000 lb. per month, the writer estimated that the cost of producing zinc electrolytically should be 4 cents per lb. when power was available at \$14 per horse-power year.

In a large plant the above costs would be considerably reduced. About 30,000 lb. of zinc were produced, which averaged 99.95 per cent. zinc.

The work showed that it was possible to operate upon a commercial scale, but that weakness existed in the diaphragm material, and that many of the mechanical details could be improved. The process possessed advantages over other processes with respect to extraction, current efficiency, and necessary purity of the electrolyte, for good results were obtained in solutions in which ordinary electrolysis is impossible. With a satisfactory diaphragm it seemed probable that a higher acid electrolyte could be used with a correspondingly high current density, and that future development would be along this line.

THE THERMOCOUPLE NICHROME-CONSTANTAN.

DURING the course of an investigation by R. W. WOODWARD and T. R. HARRISON, at the BUREAU OF STANDARDS, of the temperature distribution in cooling rails of various sections, it became necessary to use thermocouples under unfavourable and peculiar conditions. These required that the couples should be small and remain constant in their calibration while enclosed to a depth of 4 in. in holes of 6 mm. diameter in steel at 1,000° C. in an oxidising atmosphere without the use of porcelain insulators in the usual manner.

After a trial of several base-metal elements, a couple of No. 18 nichrome and No. 12 constantan was found to answer the purpose very satisfactorily. These wires had a single asbestos wrapping, and were further protected by covering with a thick mixture of kaolin and sodium silicate, winding with asbestos cord, and again smearing with a thinner mixture of kaolin and sodium silicate.

A life test of this combination of thermo elements was made, together with others of nichrome-constantan and iron-constantan.

The couples of nichrome-constantan maintained a very nearly constant calibration—to within 10° C.—during their life, and could be relied upon to 10° C. as long as there was a metallic electrical circuit, whereas the iron-constantan couple had a practically uniformly diminishing E.M.F. In all cases it was the constantan wire that failed, by oxidation and becoming so brittle that it readily broke; the nichrome wire never became brittle, and showed no considerable oxidation.

The couple nichrome-constantan showed a remarkably high E.M.F.; the calibration curve was very nearly linear, and showed no departure from a smooth curve. The same calibration was found to hold good to within 1° up to 1,000° C. for other couples made of wire from the same lot, but it would probably be different for wires from other lots or other wires from this lot.

Couples were constructed of this combination for use in the investigation referred to, and to date had been found to give very good service.

For use in the air, therefore, to 1,000° C., even when only incompletely protected, these data and subsequent experience showed that the thermocouple nichrome-constantan would maintain its

CALIBRATION OF NICHROME-CONSTANTAN.

Temperature, Deg. C.	E.M.F., Millivolts.	Temperature, Deg. C.	E.M.F., Millivolts.
108	1'92	632	37'4
204	9'90	842	52'2
292	14'9	1,033	66'3
434	23'8		

constancy to within 10° C. (18° F.) until nearly completely oxidised. The E.M.F. of this couple was high, 63'8 mv. at 1,000° C., as compared with iron-constantan, 57'5 mv. at 1,000° C.; nickel-constantan, 27'2 mv. at 1,000° C.; nickel-nichrome, 28 mv. at 1,000° C.; and cobalt-constantan, 39'5 mv. at 1,000° C.

* Metallurgical and Chemical Engineering.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Employment of Disabled Soldiers.

It was with regret that I read your paragraph on the employment of disabled soldiers in the REVIEW of July 27th. You "note with surprise" that "a municipal undertaking is advertising for invalided young officers to act as switchboard attendants at 37s. a week." Further, you "cannot help feeling that this offer borders on an insult to men . . . who have received a liberal education, and who have occupied positions of trust and responsibility."

May I say quite frankly that this paragraph is an insult to every switchboard and sub-station attendant in the country? Does not the switchboard attendant hold "a position of trust and responsibility"? And how many of these attendants have not received an education equal to, if not better than, the average young officer? The majority of sub-station and switchboard attendants are as conversant with their work, and quite as intelligent and well educated, both socially and technically, as 75 per cent. of the officers in the Army to-day. From my own experience of over eight years I consider the average station attendant to be far better educated and to hold a far more responsible position than 90 per cent. of the men in other trades drawing the same salary. It must be remembered, too, that education and efficiency are not by any means the only roads to promotion in the Army; recent disclosures prove this.

As a constant reader of your valuable paper, I consider you would be rendering a greater service to the country by urging the importance and responsibility of every grade of power and sub-station worker, from the shift engineer downwards, than by belittling the responsibility of men who are silently serving their country controlling, day and night, the intricate copper networks forming the arteries through which the life blood of the munitions industry flows; or than by applauding the introduction to responsible positions of women, many of whom, previous to the war, never had more responsibility on their shoulders than the keeping of a toy dog.

E. M. F.

I have read with hot indignation your paragraph on page 87, protesting against officers being insulted by the offer of work as sub-station attendants at 37s. per week.

The theme of the article is sound, but what have sub-station attendants done to earn what the Editor of the REVIEW would, in other circumstances, call "a gratuitous slur" which runs through the paragraph? Had the lines been written by an officer one would have been tempted to put it down to snobbishness, but these gallant fellows are at least not guilty here.

In my experience of sub-station work, I have gone on shift with more than one B.Sc. The chief engineer of one of our largest electrical railways was once, I believe, a sub-station attendant. Yet here is the Editor of the REVIEW insinuating that we are all illiterate nonentities! True, many a hundred subscribe to the E.R., but perhaps it is because they like its pretty blue cover.

The fact that women can do the work does not render it less skilful in the operating; was the discovery of radium less important because a woman gave it to the world?

A good shift engineer, Sir, is worth his weight in gold, and companies who employ the inferior operator are asking for trouble. The best automatons will fail at times, and it is at this moment that a good man (even though he be not an officer) will save his firm as many hundreds of pounds as he earns shillings per week. The cheaper and inexperienced man (or woman) rushes about in confusion, with sudden death dogging his footsteps the while. The insult in question lies in the wage, not the work, that this municipality is offering to these gentlemen.

Teddington, August 4th, 1917.

Alfred Bridges.

[We fully appreciate the point of view of our correspondents, and admire the ability with which they plead their cause. We do not admit, however, that, when read without personal bias, our note can be made to bear the construction that they place upon it. For one thing, we said nothing at all about shift engineers why drag them in! The question at issue is simply whether the post of switchboard attendant, at a salary of 25s. a week + a war bonus of 12s., is a fit and proper one to offer to men who have borne His Majesty's commission, and have suffered in defence of their country. Is this the best that we can do for them?

The Council and the Local Sections of the I.E.E., as well as the L.C.C. and other public bodies, have decided that switchboard attendance is a suitable occupation for disabled soldiers and sailors who have had a few weeks' training; it stands to reason, therefore, if these authorities are right, that it does not call for the possession of those qualifications which are looked for, and should be found, in their quondam officers. We may cite also the Memorandum of the Reserved Occupations Committee, which was endorsed by the I.M.E.A., and recommended the employment of women in this capacity (see ELEC. REV., February 23rd, 1917, page 212).

As for the skilled and educated men on whose behalf our correspondents so ably intervene we had not the least intention to reflect upon their merits; our past records show that we have always striven to raise their status and their salaries—the A.E.S.E. was initiated through our columns and with our aid—and we are convinced that many of them are far too good for the jobs (and the pay) that they get. EDS. ELEC. REV.]

Prospective Engineering Policy in France.

Belloc has described her villages as the pinpoints on which the lace work of France is stretched.

The metaphor is delightfully appropriate. France has always striven after a peculiarly effective centralised system. Noticeable originally in her national policy, it has evolved a natural corollary in the grouping of her village communities.

Miserably ruined as they are, these clusters of razed brick and mortar in the area evacuated by the enemy last spring, form a strikingly definite object lesson to us who are fighting amidst the débâcle.

Your mention of M. Laurent's view on the prospective electrical energy of the country after this war, in your issue of July 13th, may make these lines of interest to your readers.

The enemy has taken special pains to totally destroy the original power network that fed the villages from large central stations established in the proximity of provincial towns in the pre-war days.

The country side is littered with the shattered concrete masts that directed electrical energy from point to point.

One thing is evident. France cannot build on the old foundations. She must conceive and carry out a totally new scheme; and this, I fear, will in a large measure impede immediate construction of power plant and supply.

We electrical engineers have naturally come to accept our scientific production as a primary source of vitality in the national life. Such a conclusion is justified, but only when the national life exists—i.e., when community is a fact, and definite symbols, such as houses, stand for the verification of that fact.

The problem that confronts the France of to-morrow is primarily the regeneration of her existence.

Will she adopt her intensely centralised plan of hitherto, or will she follow, say, on English lines, and have, not only the village, but also a formidable scattering of outlying farms and factories?

It is a question that will require very careful consideration and the boldest handling. The allotment of land fairly—on the basis of individual pre-war prosperity or on the numerical strength of remaining citizen families in proportion to the devastated area—is a trial that the strongest of nations may fairly quail from.

The engineer's rôle in the near future will be, not a fevered building for building's sake, but rather one of mature thought, out of which he will be enabled to form some idea, not only definite, but also one capable of a limitless and, above all, a quick expansion.

This is a task that, under the present abnormal conditions, has no precedent to guide its ultimate conclusion.

We have before us a wonderful scope, and it is our duty not only to fight with France, as we are doing to-day, but also, when the time comes, to strain every nerve to help her in her future policy. Taking account of the intimate local knowledge (often bitter) of her countryside that this war has given us, we must endeavour, as her ally, to help in adjusting—to the best of our ability—this policy, within the bounds of latest scientific law and probability.

The opening-up of your columns to matters French is, if I may say so, a big advance in an essential direction.

R. C. Andersen.

B.E.F., July 30th, 1917.

[Our correspondent's letter is very welcome, and we cordially agree with his views; we hope that our alliance with France in war time will persist as partnership when peace returns. May we point out, with reference to the last paragraph of Mr. Andersen's letter, that "the opening-up" of our columns to French affairs is no new departure? For many years past we have from time to time reviewed the progress of electrical developments in France, and we have published many illustrated articles on French electrical undertakings.—EDS. ELEC. REV.]

The Perils of Jest.

Mr. Perren Maycock's letters on your reviewer's remarks have brought tears to the eyes of many. They remind me of a conversation with my friend Mr. Macpherson, when I repeated the old tag that a Scotchman jokes with difficulty. Seeing his anger, I added that the statement was silly enough, for many of my most witty friends were Scotch. Mr. Macpherson glared at me, inflated his chest, and, with emphasis, replied: "Sir, no Scotchman ever lowers himself by such a contemptible act as a joke." As the poet has said:—

"Beware of a jest, for he is not blest,
Who jokes with a friend that is dour;
The man who is wise everlastingly tries
To hold up a face that is sour."

That rule is inviolate in the electrical industry, at any rate, on its official side. One no more should jest in a book review than at an I.E.E. meeting. Shortly before his death, Mr. Robert Hammond gave an address at a Local Section of the I.E.E., in which he related his early experiences. It was all very good, and had it been reported in the I.E.E. Journal, the number would have remained in a handy place long after the other volumes had received their merited promotion to the attic. But, alas! Mr. Hammond had the fatal defect of humour and humanness, and the speech is lost, for ever.

Mr. Maycock deserves reparation for his moral and intellectual damages. Why should not the Editor permit him to review the next edition of his book? At any rate, we would feel sure that the reviewer had read it.

Jack Point.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

A Novel Soldering Iron.

A copper-pointed soldering iron which is heated by the contact resistance with two carbon electrodes, or more specifically by the white heat produced at the electrode tips, is being manufactured by the CLEMENS ELECTRICAL CORPORATION, of Buffalo, N.Y. The copper point is brought in contact with the electrodes by releasing a catch on the spring. The iron may be heated ready for use in

FIG. 1.—ELECTRODE-HEATED SOLDERING IRON.

less than two minutes, it is claimed. The outfit is designed for tinning, running seams, and soldering low-fusing metals such as zinc and lead. Two sizes are made, one requiring 60 watts and the other 150 watts. Any special pointed copper can be attached to this soldering iron. To heat these irons only 5 to 7 volts is used, transformers being provided to give this low voltage.

Gravity Cell with Small Local Action.

In a communication to the Société Internationale des Electriciens, M. Ch. Féry discussed the causes of the irregular wasting of the zinc rods in salammioniac cells, and stated that the more rapid consumption of the upper part of the rod was due not only to the oxygen of the air, but still more to a secondary electrolytic action between the parts of the rod which were immersed in two dissimilar liquids. As the result of experiments, the author concluded

FIG. 2.—SECTION OF GRAVITY CELL.

that the best plan was to use a flat zinc plate lying horizontally at the bottom of the cell, as in fig. 2, supported on insulating rods *l, l*. The carbon electrodes resting on similar rods are L-shaped plates, on edge, joined together with a screwed metallic rod *t*. A cell of this type, having a zinc plate of 100 cm.² (15.5 sq. in.) and 10 carbon plates gave on short circuit a current of 2.5 amperes.

"Roller" Lock-Nut.

Of the designing of new forms of lock-nuts there would seem to be no end; the latest to come under our notice is one that has recently been introduced by the ROLLER LOCK NUT CO. of 61,

FIG. 3.—ROLLER LOCK-NUT, PART SECTION.

Broadway, New York, and which has certainly the feature of novel design. In the top of the nut is a recessed section, in which is attached a piece of thin spring brass bearing on one end a hard

roller. When tightening the nut, this roller is forced by the reverse motion of the bolt back into the recess. On the other hand, any motion of the nut backward off the bolt draws the roller forward against a projection in the wall, tending to hold it tighter. While the nut is thus claimed to be self-tightening under the usual conditions of vibration, it can, when desired, be loosened by a spanner. Just beyond the projection in the track of the roller is a deep pocket; when a spanner is applied sufficient force is exerted to carry the roller over the projection into this pocket, where it is out of the way and does not interfere with the free movement of the nut. Another advantage claimed for the new lock-nut is that as it contains its own locking device, only one nut has to be employed, thus allowing the use of a shorter bolt than when two nuts are necessary. At present the nut, which is stated to have been adopted by a number of leading American engineering concerns, is only being supplied in sizes for U.S. standard screw threads.

THE MUNICIPAL ELECTRICAL ASSOCIATION AND ELECTRICITY SUPPLY REORGANISATION.

A CIRCULAR letter has recently been issued to members of the I.M.E.A., in which the Council state that they feel they should give to the members as much information as possible regarding their actions in connection with the future of the electrical industry as now being dealt with by Committees appointed by the Board of Trade and otherwise.

It is a matter for great regret that full information cannot be imparted at the present time, owing to the withholding by the Government of the report of the Board of Trade Electrical Trades Committee (Sir Charles Parsons's Committee) and the interim report of the Coal Conservation Sub-Committee of the Reconstruction Committee.

The Council are strongly of opinion that pressure should be brought to bear with the object of obtaining the immediate publication of these reports. This would release evidence which has now to be preserved in confidence, and enable more open discussion by those most concerned and best informed.

The I.M.E.A. Council, on November 1st, 1916, agreed several resolutions regarding the appointment of a Central Board of Control or Commission to take over the whole of the duties at present exercised by the Board of Trade, Local Government Board, Home Office, and other Departments, so far as they relate to the administration of the Electric Lighting Acts; such Central Board to have full powers, but not to be authorised to own or operate electricity works.

The new Central Board will be a progressive body with the interests of the industry at heart, and should, therefore, have complete control—subject to Parliament alone—over all such matters as the granting of powers, approval of rates of charge, formulation of rules now drawn up by the Board of Trade, &c.

It was specified that members of the Board should be whole-time officers, who should sell out all securities owned by them in any electrical undertakings, so that the confidence of the country may be furthered by the assurance that those in control are entirely disinterested.

The Council have come to the conclusion that to secure the most economical production of electricity, generation in the future must be by large power stations, though not necessarily in every instance by new super-stations; that the large power stations can best be controlled and operated by District Boards consisting of representatives appointed by the present statutory undertakings (both local authority and company), and that the distribution shall remain with present undertakers, subject to suitable safeguards to protect consumers.

The Council are fully aware that the idea of transferring to a District Board some of the powers now exercised in regard to the generating side of the business may not commend itself to some existing undertakings, but they are convinced that in order to secure a large and economical supply of electrical energy, it will be necessary to adopt centralised generation with large units of plant, and the interests of all parties concerned are best met (so far as generation and transmission are concerned) by advocating joint control and operation by District Boards.

In the event of the status or remuneration of an official of any undertaking being adversely affected through the formation of a District Board, such an official shall be entitled to compensation.

A report of the Lancashire and Cheshire Linking-up Committee will be published within a few days, the details of which will prove of considerable interest in the fuller consideration of schemes for supply throughout the country.

A resolution was transmitted to the President of the Board of Trade in accordance with the instructions of the annual general meeting; it is a matter of great regret that, although three additional members have been added to the Committee, these additions have been made without reference either to the I.M.E.A., which represents the municipal electrical interests, or to the individual municipalities concerned. The Council feel that further attempts to get the representation on the Committee adjusted at the present time would be futile, and do not, therefore, propose to take further action at present.

As regards the giving of further evidence, Mr. Faraday Proctor having been deputed to give evidence for the Association, it is desired that any members having points of importance to be

brought forward which have not been otherwise dealt with, should send particulars of the same to him immediately, with a copy or draft of information prepared for witnesses.

It will be realised that many points have already been dealt with by the Association's witnesses before Sir Charles Parsons's Committee, and by the witnesses of the Association of Municipal Corporations.

At the annual general meeting of the I.M.E.A., on June 22nd, several members stated that plant extensions by municipalities were being refused by the authorities while power companies appeared to be favoured in that matter. The Council will be glad if members will advise them of specific examples, which have come within their personal knowledge, of undue obstruction experienced by local authorities, and of undue assistance given to power companies in connection with extensions of plant or mains, so that the information may be tabulated with a view to taking further action on the matter.

WAR ITEMS.

Trading with the Enemy.—The "London Gazette" for August 3rd contains further lists of persons or bodies in a number of countries with which or whom trading is prohibited:—Netherlands East Indies, Norway, Spain, Sweden, Venezuela, &c.

Copper Shortage in Germany.—Reuter's agent at Amsterdam quotes the *Koelnische Volkszeitung* to the effect that the German Government are requisitioning lightning conductors on account of the copper and platinum from which these are made.

The First Problem.—Reconstruction after the war was the subject of the inaugural address given by Mr. Herbert Samuel at the Oxford University Extension summer meeting. He said that an increased national production of wealth would be a prime necessity. It was clear that restrictions on the output of either workpeople or of machines would be more than ever injurious, but if they were to be removed it must be with the assistance of Labour, and some alternative means must be provided to give that protection to the worker which the restrictions were designed to secure. How to achieve this was the first of our problems.—*Times*.

Education After the War.—Lord Haldane, speaking at a conference at Oxford on educational reconstruction, said that the end of the struggle would not find society as it was when the struggle began. He looked upon education as the most important element in reconstruction. Let them begin with education, take it as their foundation, and social problems would solve themselves. Education was a thing of tremendous significance. One of the great problems of Labour was how to make Labour interesting; they had too little imagination about the grievances of the labourer. One of his great grievances was that his toil was mechanical and dull. With the march of science marched also the machine, which took away very much of the dull and monotonous work. The higher the application of knowledge to industry, and the more thoroughly science penetrated their industrial organisation, the more closely they would get to the time when every man, even the great bulk of those engaged in manual labour, would realise that brain power was as necessary as muscle power.

As reported in the *Times*, Lord Haldane said he was deeply convinced that in education, as in most other things, unless there were devolution—devolution to those who were able and willing to work in the various localities—they would not make very much progress. Local self-government was their principle there as elsewhere. This war had shown what the nation could accomplish when we were put to it, and we could accomplish far more for education if we had a little more orderliness in our composition. This was the time to think. Peace would come some time. It might come soon and it might not, and it might be sudden. The risk we ran was that before peace came we might not have thought out how to deal with the great problems which would be upon us.

The Work of Reconstruction.—Sir G. Cave, addressing the House of Commons respecting the setting up of the Ministry of Reconstruction, said (according to the *Times* report) that there was important and vital work for the Minister to do. The more he saw of the machinery of the war, and the more he realised the tremendous upheaval which must take place on the conclusion of peace, the more ardently he desired to take all the steps that he could to render efficient and effective the policy of reconstruction. The demobilisation, not only of the Army, but of the industrial army, would be of vital interest to the working classes. No one could think of the great bodies of men and women now employed in munition factories without being anxious as to what their fate would be if the war suddenly came to an end. They wanted a department which would charge itself with the consideration of those grave problems and would recommend to the other departments that were directly concerned the steps which should be taken.

Lord Parmoor, in a speech at Liverpool, said it was very right that even under the great stress of war we should look forward in good time to what was necessary for reconstruction

in our commercial life in the future. He did not believe so much in one large general scheme of reconstruction, but that every commercial society should do what it could within its own powers and its own area to add to what might be the stream of progress which they hoped might come after the war. He was a great believer in research and study and in collective action, but if they allowed that to supersede what he called the vitalising effect of individual energy and individual enterprise, they might purchase the advantage at too high a rate. However much they might depend upon research and knowledge, there was something in the energy, the life, and perseverance of the individual on which they had relied in the past in their English commercial enterprise, and which he hoped would not be less potent and less powerful in future. Lord Parmoor thought they ought to a great extent to revert to the old apprenticeship system.—*Daily Telegraph*.

Belgian Trade: A Government Committee.—The Government has appointed a committee to investigate the means of promotion and advancement of trade and commerce between the British Empire and Belgium. In view of the importance of the operations of this committee, we give its constitution and terms of reference in full:—The members of the Committee are:—

Representing the Foreign Office:—Sir Cecil Hertslet (Chairman of the Committee), His Majesty's Consul-General for Belgium; Mr. R. Macleay, Counsellor of Embassy in the Diplomatic Service, Deputy Controller of the Foreign Trade Department, Foreign Office; Mr. M. Neville Kearney (Secretary of the Committee), of the Consular Service, attached to the Foreign Office.

Representing the Board of Trade:—Sir W. H. Clark, Comptroller-General of the Department of Commercial Intelligence, Board of Trade; Sir E. Wyldbore-Smith, Director of the Commission Internationale de Ravitaillement; Mr. Percy Ashley, Board of Trade.

Representing British Commercial and Financial Interests:—Sir Algernon F. Firth, representing the Association of Chambers of Commerce of the United Kingdom; Mr. E. F. Oldham, representing the Federation of British Industries; Mr. M. Cleminson, representing the Chamber of Shipping of the United Kingdom and the Liverpool Steamship Owners' Association; Sir R. Vassar-Smith (chairman of the Committee of London Clearing Bankers), representing the Bankers' Clearing House; Lord Faringdon, representing the British Trade Corporation; Mr. Frank Potter (general manager, Great Western Railway), representing the Railway Executive Committee.

The terms of reference show that the Committee is established for the purpose of inquiring into all matters relative to trade between the British Empire and Belgium, with a view to increase and develop that trade by every desirable means. It will be the duty of the Committee to investigate as far as possible all means to be adopted in order to attain the foregoing object. The Committee will examine into the supplies and requirements of the representative countries (in so far as they have relation to its scope), and give advice as to how trade between them can best be established, developed, and increased. It will obtain information and evidence from all available sources, and endeavour to render all possible assistance in regard to shipping, manufactures, imports, and exports, and trade generally between the Empire and kingdom.

The Committee constituted as above, will have power to add to its numbers by the appointment of such persons of experience in the matters with which it has to deal as it may think expedient, and it will also consult from time to time other representatives of commerce having special knowledge of Belgian trade, shipping, and finance.

It is particularly laid down that the purpose of the Committee shall be a general one, and that it shall not be part of its duties to foster the advancement of the trade of any particular individual or firm, nor to devote its assistance to any special branch of trade or industry except in relation to the general principles for which it is established.

The Committee will be known as "The Belgian Trade Committee." An office has been established provisionally at 39, Parliament Street, S.W.1, to which all communications should be addressed.

Exemption Applications.—At Batley Local Tribunal, exemption to October 1st was granted in the case of H. A. Wilson (28, married, in Class B 2), a motorman for the Tramways Co. The representative of the company said there were already 14 cars standing idle owing to lack of drivers.

At Rochdale, the Tramways Department appealed for E. Kershaw (35, single, Class A), motorman. Mr. Webster, general manager, said he was hard pressed for drivers, and they were working seven days a week. The claim was refused, to report on September 30th.

At Ormskirk Tribunal, Levi T. Allen (35, B 1), electrical engineer, said he was the only electrical engineer and contractor for lighting and power purposes in the town. He had had to give up his shop in Burscough Street because he could not get men. Exemption to August 31st was given, no further appeal to be made without leave.

At Rochdale, on the application of the Corporation tramways department, conditional exemption has been granted to J. Brandrick (26, C 2), electrical fitter.

Douglas (Isle of Man) Tribunal has given conditional exemption, with the assent of the Military, to A. E. Barlow (25), tram conductor, and E. W. Dolson (37), tram driver.

In an appeal at Rugby, an electrician (33), stated that, on re-examination, his classification had been altered from general service to C 1; he asked for a Munitions Order. The Military Representative said that electricians were required for the Army, and final exemption until August 15th was granted.

On the appeal of Mr. Lambert, tramways manager, Maldstone Tribunal has granted six months' exemption to E. J. Freed (40, C2), inspector, and F. Rose (35, passed for general service), driver.

At Brighton, Mr. W. Marsh appealed for 27 men engaged on the Corporation tramways, and said that it was simply a question whether the trams were to run or not. All the men asked for were highly skilled, and it would be impossible to replace them. Each was given three months.

Before the Surbiton Tribunal, the resident engineer at the electricity works applied for exemption for a meter mechanic (27, C2). It was claimed that he was in a protected occupation, and it was mentioned that he had been rejected, although he underwent an operation to enable himself to pass. The Tribunal ruled against the man being in a certified occupation, but the appeal was respite for further consideration.

At Grays, the electrical engineer to the U.D.C. (Mr. E. D. Long) appealed for the retention of a mechanic (31, Class A). Three months, subject to substitution, were granted.

At Coalville, on Aug. 1st, a final month only was granted to an electrician (40, B1) appealed for by Mrs. Haydock, of Charnwood Towers.

Strood (Kent) Rural Tribunal has given exemption until October 31st to S. J. Nettingham, electrician, appealed for by the Thames Portland Cement Co.

At Southend-on-Sea, the Military asked for the withdrawal of exemption held by an overhead wireman in the employ of the Corporation. It transpired that this was not now the man's chief employment, and the certificate was cancelled.

Conditional exemption has been granted at Swinton to an electrician (41; B2), in business in the area.

At Canterbury, on July 31st, in the case of a coal trimmer at the Corporation electricity works, who had been exempted until substituted, it was stated that the man presented himself for the Royal Navy on July 2nd, and after being passed as a gunner-instructor, he failed to pass the doctor, and he had been discharged from the service. Mr. Blaschek (electrical engineer) had consulted with the recruiting officer, who had agreed that as a result of the recent War Office Order, the man, having been overseas, and only classified C1, was not to be called. The man did not want to go away for substitution, and it was agreed that the existing certificate should be cancelled, so that Mr. Blaschek shall have the right to appeal again.

Leyton Tribunal has allowed exemption until December 31st to B. L. Hutchins (37, C2), a L.C.C. tram conductor.

At Rotherham, the Corporation defended Military appeals against 12 tramway motormen and three car repairers. On it being suggested that there should be substitution, the assistant engineer said that 14 wounded soldiers had been sent, and only seven were able to stand the work. The Chairman (Ald. T. W. Grundy) expressed the hope that if substitutes were found the men most fit would be released. In reply to the Military Representative, the assistant manager said that it was impossible for females to drive cars in Rotherham. The Military appeals were disallowed and the exemptions confirmed.

Dartford Tribunal has granted conditional exemption to H. H. Lygo (27, B1), electrical engineer at the Joyce Green power station.

BUSINESS NOTES.

Patent for Disposal.—The proprietor of Patent No. 20,111, of 1913, "Speech-reproducing apparatus," wishes to dispose of the patent or to license British manufacturers to work under it. Full particulars are given in our advertisement pages to-day.

For Sale.—Owing to the death of the proprietor, the business, plant, machinery, &c., of MESSRS. ADAMS BROS., electrical engineers, Longton, is for disposal as a going concern. For particulars see our advertisement pages to-day.

Russian Exhibition in London.—There is being held at the Central Hall, Westminster, a Russian Exhibition illustrating the chief features of Russian economic life. The exhibition opened on Tuesday last, and will close on 18th inst. Lectures are being delivered daily. That on Wednesday dealt with mineral resources, that of yesterday considered the Russian industries, and to-day foreign trade will be the subject.

Tudor Accumulator Co., Ltd.—The annual meeting of this company was held on July 25th at 3, Central Buildings, Westminster. The board as now constituted is as follows:—Mr. B. M. Drake (chairman); Messrs. E. J. Clark, W. C. Johnson, Capt. T. Prestige, C. R. D. Pritchett, and G. E. B. Pritchett, directors; Messrs. A. B. Pescatore and E. Jacob, managing directors.

The chairman said it would doubtless be satisfactory to municipalities and others who used Tudor accumulators to know that the company was now in British hands. The directors were pleased to have been able to conclude agreements by which the services of the managers, both at the head office and the works, were retained. He referred to the very liberal war allowances, which amounted

last year to no less than £5,025, and he anticipated that the company would obtain a fair share of available work now that all enemy interests, which had acted as a deterrent in the past, had been effectually removed.

Catalogues and Lists.—MESSRS. GENT & CO., LTD., Faraday Works, Leicester.—List giving illustrations, brief particulars and prices of their "Tangent" mining bells, special keys, new pattern flameproof relay with machined flange joints (lock and key), ironclad telephones and switchboards. The bells and relays are wound to Home Office and Dr. Wheeler's recommendations.

FULLER'S CARBON AND ELECTRICAL CO., LTD., Woodland Works, Chadwell Heath, E.—Twenty-page catalogue of carbons for cinemas, search lights, arc lamps, primary batteries, welding, and general electrochemical purposes. More than half of the list is devoted to tabulated prices of flame, open and enclosed type arc lamp carbons. The company's new carbon works are now in full working order.

MR. F. J. DOWN, 90-93, Fenchurch Street, London, E.C. 8-page pamphlet containing an illustrated description of the reciprocating track grinder supplied by the Railway Track-work Co. of Philadelphia.

Dissolutions and Liquidations.—GLOBE ASSOCIATED CABLE AND TELEGRAPHIC SERVICES, LTD., 20 to 23, Holborn, London.—Liquidator released, July 31st, 1917.

HALL-EDWARDS & EMRYS-JONES, medical electro-therapists and X-ray specialists, 141A, Great Charles Street, Birmingham.—Messrs. J. F. Hall-Edwards and M. F. Emrys-Jones have dissolved partnership. The former will attend to debts.

ECONOMIC ELECTRIC CO., electrical and mechanical engineers, 127A, Oxtou Road, and Hamilton Lane, Birkenhead.—Messrs. T. W. Jefferson and T. E. Jones have dissolved partnership. Mr. Jones attends to debts, &c., and will carry on business at the Oxtou Road address as the Economical Electric Co. Mr. Jefferson will carry on business at 79A, Grange Road, Birkenhead, under his own name.

CANADIAN BRITISH ENGINEERING CO., LTD.—Creditors must send particulars of their debts, &c., to the liquidator, Mr. R. G. Sidford, 20, John Street, Adelphi, London, W.C. 2, by September 1st.

Trade Announcement.—THE CONSOLIDATED PNEUMATIC TOOL CO., LTD., have secured temporary accommodation at Egyptian House, 170, Piccadilly, W. 1, their offices at Palace Chambers having been commandeered by the Government authorities.

Bankruptcy Proceedings.—JOHN TAYLOR PEDDIE, mechanical engineer, Exhibition Buildings, Aldwych Site, Strand, London.—Trustee released, July 6th, 1917.

Fire.—A fire occurred, on July 31st, in a large vault used as stores at the premises of the Western Electric Co., Ltd., North Woolwich, E.

Book Notices.—"Scientific Papers of the Bureau of Standards." No. 299. "An Average Eye for Heterochromatic Photometry, and a Comparison of a Flicker and an Equality of Brightness Photometer." Washington: Department of Commerce, Bureau of Standards. The comparison of lights of different colours is supposed to be based on an "average normal eye." This paper records an attempt to approximate the results of such an eye with typical colour differences by using a large number of observers. In particular, results obtained by a flicker photometer and by an equality-of-brightness photometer, with different degrees of colour differences, are compared. In terms of the Ives-Kingsbury test solutions, for which the proposed normal ratio of transmissions (with a 4-w./c.p. carbon lamp) is 1.00, the average of 114 observers gives a ratio of 0.99. By using these test solutions, results obtained on the flicker photometer by a small number of observers can be corrected so as to give normal values with a high degree of accuracy. On the average, equality-of-brightness measurements also vary in proportion to the test ratio, but erratic variations often overshadow these systematic differences. For sources having relatively high intensity in the blue, flicker values tend to fall below those obtained on the usual standard photometers, but the difference is comparable in magnitude with the uncertainty of the latter values. This publication is now available for distribution, and those interested may obtain a copy by addressing a request to the Bureau.

The July issue of the Tramways and Light Railways Association Journal is a special Congress number, containing reports of the papers and discussions at the annual gathering held in June.

The Journal of the Junior Institution of Engineers for August contains some useful hints on the rectification of faults in the working of paraffin engines, and notes on "Quantities and Estimates" by Mr. C. O. Mourant.

LIGHTING AND POWER NOTES.

Burnley.—VEHICLE CHARGING.—The Electricity Committee has decided to provide charging facilities for electric vehicles, the price being 14d. per unit.

Batley.—PRICE INCREASE.—The Corporation has decided to increase the price of current by $7\frac{1}{2}$ per cent. on the pre-war charges for lighting, and 2½ per cent. for motive power. The new prices will operate from October 1st.

Bath.—YEAR'S WORKING.—The annual report of the working of the Corporation electricity department for the year ended March 31st last, shows a deficit of £1,782, due to the increased cost of coal, wages, &c. The total income of the undertaking was £26,507, as compared with £26,490, and expenditure amounted to £14,987, as compared with £13,529, leaving a gross profit of £11,520, as compared with £12,961; interest and sinking fund charges absorbed £12,649, and, with £120 for special expenditure, made a total of £12,769, which leaves a deficit of £1,782. The total amount borrowed is £192,574, of which £105,486 has been repaid, leaving a balance outstanding of £87,088. Next year two of the earliest loans will be liquidated, totalling £50,378, which will mean a relief in the repayments item of over £3,000. The total number of units generated during the year was 2,603,945, and the total maximum demand 1,318.5 kw.

Bradford.—PROPOSED PRICE REVISION.—Last week the City Council considered the proposed increased scale of electricity charges, to operate from October 1st, and referred to in our last issue. Ald. G. H. Robinson (chairman of the Electricity Committee), in moving the minutes, said he disagreed with the proposal, because the price to the flat-rate consumers had not been increased. Making deductions in respect of extra output, the increased cost in wages and salaries during the year ended March 31st, 1917, as compared with that ending the same date, 1914, amounted to £6,582, whilst £2,288 had been paid in allowances to dependents, and the increased cost of coal, after deductions in respect of increased output, had been £15,298. On top of these extra charges, which totalled something like £25,000, were other extra charges under the head of interest on loans, £3,272, and income-tax, £9,832, which meant together about £37,000. Electricity to the amount of £24,178 was supplied on the flat rate, and an increase of 10 per cent., in accordance with the proposal of the engineer—who was in the best position to judge, and was supported by the chairman and deputy-chairman—would mean an extra income on the flat-rate supply of £2,417. The "poor shopkeeper" had been spoken of. The shopkeepers consumed 362,000 units, and paid only £6,033. If they were charged according to the engineer's proposal, the extra income from them would be only £603 a year. The banks, also on the flat rate, consumed only 32,500 units, paying £541, and nobody would deny that they were well able to pay an extra 10 per cent. The 471 mill and warehouse consumers used 401,000 units, at a cost of £6,685, and surely those businesses could pay the extra £668 per year. The 464 offices, using 133,000 units, paid £2,223, and could afford to pay £222 per year extra. The 553 private houses on the 4d. flat rate consumed 101,000 units, and paid £1,693. They would pay an extra £169 on the 10 per cent. increase. He maintained that all flat-rate consumers could well afford to pay the increase. Ald. Robinson then said he was prepared to move an amendment to his own Committee's minutes, that they be referred back. Ald. J. Hayhurst asked the Council to accept the recommendation, with a variation to include the decision in regard to flat-rate consumers. The Council agreed to send the minutes back for reconsideration, passing the minutes with this amendment.

Canada.—ELECTRIC FARMING IN FRASER VALLEY.—Quite recently a number of ranchers to the south of Chilliwack clubbed together and raised \$5,000 for the construction of a power line from the town's electric plant to their premises, the idea being to use electric power generated by the British Columbia Electric Railway for a variety of purposes hitherto dependent on man-power. The total investment represented in line construction, power installation, and motors was in excess of \$5,000. The step taken may be attributed to the good work of Chief Electrician Porter, of the B.C.E.R. Co., Vancouver, who for the past couple of years has been demonstrating how the farmers of the Fraser Valley might lessen the hard work of husbandry by taking advantage of the company's far-flung electric system. Many farms closer to Vancouver have already done so, and now the farmers of Chilliwack district, 80 miles away, are coming into line.—*Electrical News*.

Clones (Co. Monaghan).—STREET LIGHTING.—The Urban Council has accepted the tender of the Clones Electric Light and Power Co., Ltd., for the public lighting of the town for three years, at 5d. per unit, with a rebate of 10 per cent. should the account in any year exceed £50.

Continental.—SPAIN.—A concession has been secured by Joaquin Moreno Ramirez to extract water from the River Segura, and erect a hydro-electric station for the generation of electric current for industrial purposes.

Gillingham (Kent).—PRICE INCREASE, &c.—The Corporation Electric Light Committee is considering the advisability of adapting the existing Diesel plant to use tar oil. The charges for current are to be increased from 25 per cent. to 10 per cent.

Hove.—PRICE REVISION.—The Lighting Committee has considered the advisability of revising the present charges for power purposes. The present flat rate is 1½d. per unit, which is less than the present war-time cost of generating the unit. The Committee recommends an increase to 2d. per unit on the flat rate and by 10 per cent. on the indicator rate.

Leeds.—WAGES ARBITRATION.—On Tuesday, last week, Mr. Forbes Lankester, K.C., sat as arbitrator between the Corporation and the General Workers' Union, the latter of whom claimed, on behalf of the workers in the electricity and gas departments, an advance of pay of 10s. per week above pre-war rates, instead of the

7s. granted. For the men it was pointed out that they worked alongside members of the Amalgamated Society of Engineers, who, as from August 1st, were to receive an advance of 15s. above pre-war rates by a recent award. For the Corporation it was held that the ratepayers were already hard pressed by war conditions, and that the claim was uncalled for so soon after the award to the tramwaymen. The men who were not tramwaymen, and who had received an advance of 2s. only three months ago, should be satisfied. The arbitrator heard the deputation from the men, and reserved his decision.

Maidstone.—PRICE INCREASE.—The T.C. has increased the charges for current for lighting by ½d. per unit for traction by ½d. per unit, and the fixed charge per annum of 12s. per 30-watt lamp and all other forms of supply by 10 per cent.

Newport.—LINKING-UP.—Mr. A. Nichols Moore has reported to the Electricity Committee in regard to the linking-up proposals for South Wales, his report being generally in line with that already submitted to the Cardiff Electricity Committee by Mr. Arthur Ellis, and the Committee has authorised him to take any steps that are necessary to further the proposals, on the distinct understanding that such steps as are taken shall in no way commit it to any scheme. Mr. John Moxon, chairman of the Electricity Committee, emphasised the importance of the Corporation taking an active part in any deliberations that might be on foot.

Queensbury and Clayton (Yorkshire).—PROV. ORDER.—The Electrical Distribution of Yorkshire, Ltd., has informed the Queensbury Council that it has abandoned its application for a prov. order to supply Queensbury and Clayton, owing to the opposition of the Bradford and Halifax Corporations. The company considered it had an obligation to Queensbury, even if Clayton became merged in Bradford, and stated it would proceed with the application in the next session of Parliament.

Rockdale.—The Corporation Electricity Committee notifies that new applications for electric power supply cannot be entertained at present.

Royton.—An arrangement has been made between the District Council and the Oldham Corporation Electricity Committee for the supply of electricity. The contribution to the cost of the prov. order was fixed at £200 up to a cost of £300, and one half if over that sum. The prices are to be the same as those charged in the borough. To the withholding of consent to the Lancashire Electric Power Co. to come into the area, Royton agrees so far as it can lawfully do so. The period of agreement with Oldham is to be 30 years, terminable then on a prior six months' notice, with subsequent periods of 10 years.

Spenborough.—PROPOSED BULK SUPPLY.—The U.D.C. is in negotiation with the Yorkshire Electric Power Co. with respect to a bulk supply of electricity.

St. Austell.—STREET LIGHTING.—The Electric Light Co. has asked the U.D.C. for an allowance of 30 per cent. on the contract price (£1 16s. 9d. per lamp per annum) in respect of 95 lamps unused last year. The Council has decided to offer 25 per cent.

Stoke-on-Trent.—The Ministry of Munitions is to, be requested, before any men are taken from the existing staff of the electricity works, with the Dilution Officer's consent, to cause an inquiry to be held, as the obligations of the Corporation to give and maintain supply cannot be met with a smaller or less efficient staff than that which at present exists. Steps are to be taken to retain the commercial assistant, charge and shift engineers, switchboard attendants, stokers, and the pipefitter at the Burslem works, in view of the absolute necessity of maintaining the supply next winter. The B. of T. is to be asked to authorise the Council to disconnect part of the supply in the event of the staff being reduced below the minimum necessary to maintain the whole supply, lack of steam due to the want of sufficient and suitable coal, or any other cause rendering it necessary to reduce the load upon the steam generating plant at the central power house or any other of the stations.

Stratford-on-Avon.—PRICE INCREASE.—The E.L. Co. has, from the date of the August meter readings, increased the price of current by ½d. per unit.

Swindon.—THREE-PHASE SUPPLY.—Last week the chairman of the Electricity Committee officially started up the new three-phase A.C. plant, which is now supplying a local works.

Tasmania.—The Board of Trade Journal mentions that the company which has been formed for the production of electrolytic zinc from the Broken Hill zinc ores is erecting large works at Risdon, which will shortly commence working. If successful, an extension of works, costing from £400,000 to £500,000, will be made as soon as possible.

Tonbridge.—LOAN SANCTION.—Without holding a public inquiry, the L.G.B. has given the U.D.C. sanction to a loan of £18,000 for extensions to the electricity works. Mr. M. P. Plunkett, electrical engineer, estimates that the extension will yield an annual income of £1,600.

Tunbridge Wells.—PRICE INCREASE.—The T.C. has increased the charges for current as from September 29th as follows:—Lighting, 10 per cent.; power and heating, 25 per cent.; power for lifts, 10 per cent.

Wimbledon.—PRICE INCREASE.—There was a deficit of £4,220 on the past year's working of the Corporation electricity undertaking, and it has been decided to raise a temporary loan not exceeding £5,000 to meet the working expenses. The charge for lighting in Wimbledon, Merton, the Maldens, and Coombe is to be increased to 6d. per unit, and for power, heating, and cooking to 2d. per unit.

TRAMWAY AND RAILWAY NOTES.

Accrington.—YEAR'S WORKING.—During the past year over 5 million passengers were carried on the Corporation tramways, being 169,318 more than in the previous 12 months. The accounts show a deficit on the year's working of £976, notwithstanding the fact that the income was increased by £1,169. The sum of £872 has been granted to former employes now serving with the Colours. This is £155 less than in the previous year. A striking feature in the expenditure is the amount paid for power, £7,861, which is £1,915 in excess of the sum paid the year previous.

Australia.—A great strike of railway and tramway workers has taken place in New South Wales, it being estimated that 20,000 men are affected. The strike appears to have a political origin.

Belfast.—The recent revision of the stages and the fares of the Corporation tramway system, which it was hoped would have placed it on a better financial basis, had not that effect, for the reason that not a little of the increased revenue was immediately neutralised by raising the wages of the employes, plus quite a number of recent extensions which are not paying, and the making good of which is falling on the paying sections. Last year there was a deficit of £7,000, and there is now a certainty of a still greater deficit at the end of the present one. At the monthly meeting, the chairman of the Tramways Committee said that the time had come for the Corporation to call a halt in its expenditure, or it will have to ask Parliament to relieve it of the obligation imposed by Clause 63 of the Tramways Act of 1904. The undertaking has been saddled with an increased expenditure of £25,000 per annum, and as the revenue comes from the public, the latter must be prepared to pay up, or reconcile itself to the transfer of the undertaking to a private company. A partial remedy would be the lopping off of the terminal extensions, which are being run at a dead loss to the ratepayers.

Bradford.—In recording tramway receipts of £8,256 for last week, an increase of £577 on the receipts of the corresponding period last year, it is reported that the receipts for the 119 days of the current tramways year were £129,978, an increase of £11,322 on the same period of the previous year.

Burnley.—Following a mass meeting of Corporation tramway workers and the passing of various resolutions, it was reported on Monday that the men were about to come out on strike again. There was, however, an official assurance forthcoming from the men's secretary. It is alleged that learner drivers are being imported from Ireland.

Dartford.—FIRE.—The car sheds and 13 cars employed in the local tramway service were destroyed by fire on Tuesday morning. Great inconvenience has been caused in the town, and L.C.C. cars are being sent as substitutes.

Glasgow.—WAR RELIEF SCHEMES.—The T.C. has given its consent to a new scheme for raising money through the agency of car collections in aid of the various war relief agencies. As has been reported in the REVIEW, a large sum was secured by means of a prize drawing, the prizes consisting of works of art and war savings certificates. The Secretary for Scotland, however, prohibited the scheme, holding that it did not come under the scope of the Art Unions Act, a position from which he refused to recede, notwithstanding the representations made by several deputations who travelled to Westminster. The new scheme is, briefly, that tickets will be sold week by week as before at one penny each, but that no prizes be given—the holders of the numbers drawn in the lottery having the privilege of nominating the war charities to which the revenue accruing will be handed. Several members of the T.C. have maintained the opinion that the element of chance has not yet been eliminated from the scheme, while others argue that the sporting chance is not sufficient to attract the public, and that the scheme will, therefore, not be a success.

Halifax.—TRACK RENEWALS.—Replying to questions in regard to the Tramway Committee's proposal to relay portions of the track in Gibbet Street and on North Bridge, Mr. A. Broadley told the T.C., last week, that the Committee had sufficient rails to relay the most dangerous portion of the track—a stretch at High-roadwell, a little below the old tram depot, and another length on North Bridge. No rails being now rolled, the Committee proposed to take up rails in Fountain Street, Church Street, Thrum Hall Lane, and in the upper car-shed, which were not being used, and use them for this relaying.

Keighley. Owing to a misunderstanding, the recent arbitration award advancing the bonus from 5s. to 6s. a week, made no mention of the additional allowance of 6d. per week for each dependent child under 13 years of age, which had previously been in force, and as a result some married drivers found themselves worse off than before. This has now been rectified by the arbitrator.

Leeds.—WOMEN INSPECTORS.—The Leeds Tramways Committee has appointed six women inspectors, who commenced duty on Friday, last week, despite the opposition of the department's employes. Mass meetings of male and female employes were held, and it was decided to inform the Tramways Committee that the women inspectors would not be recognised.

Nelson.—ELECTRIC VEHICLE.—The Ministry of Munitions has refused to sanction the importation of an electric wagon purchased by the Health Committee from the Edison Accumulators, Ltd. The Committee has decided to ask the L.G.B. to assist it in obtaining permission for the delivery of the wagon.

Oldham.—Since the outbreak of war, 317 employes of the Corporation tramways have joined the Forces. The amount paid in allowances during the past 12 months was £5,463.

South Lancashire.—The Lancashire C.C. has decided to oppose the granting of the Lostock and the Barton and Stretford Light Railway Orders, in view of proposed level crossings on main roads.

TELEGRAPH AND TELEPHONE NOTES.

New Wireless Record.—According to R. Thonberg and C. Bowers, operators on the American steamer *Sonoma*, wireless messages were picked up over the record distance of 11,500 miles by the *Sonoma* from the German station at Eilvese. The *Sonoma* was two days off Australia at the time.—*Wireless World*.

Trans-Atlantic Wireless Communication.—The Marconi Co. announces that, in conformity with instructions received from the Government, as from the 4th inst., its trans-Atlantic service, both East bound and West bound, has been discontinued until further notice. The closing of this service is in no sense brought about by any fault of the Marconi Co. either here or in Canada, but is purely a necessary war measure.

CONTRACTS OPEN AND CLOSED.

OPEN.

Australia.—MELBOURNE.—October 10th. Department of the Navy. Pumping plant and equipment for the Commonwealth Naval Dockyard, Cockatoo Island, Sydney. Specifications from the Director of Navy Contracts, Melbourne.

London.—BERMONDSEY.—Sept. 7th. B.C. 500-KW. rotary converter. See "Official Notices" August 3rd.

H.M. OFFICE OF WORKS.—August 20th. 400 miles of bell wire. See "Official Notices" to-day.

Manchester.—August 18th. Supply, &c., of two electrically-driven turbo-pumps with automatic control and switch-gears, &c., for the Waterworks Committee. The Secretary, Water Department, Town Hall.

Portsmouth.—August 28th. Tramways Committee. Six months' supply of engine-room stores, insulating material, &c. See "Official Notices" to-day.

CLOSED.

Basingstoke.—T.C. Tar-oil for the electricity works: Burt, Boulton & Hayward, £5 5s. per ton.

Bridlington.—T.C. Coal (1,200 tons) for the electricity works: W. B. Wilson, York, 19s. 11d. per ton.

Rotherham.—T.C. Accepted tenders:—

Babcock & Wilcox, Ltd.—Six boilers and extensions to power station, £150,600.

British Thomson-Houston Co., Ltd.—Switchgear extension, £10,945.

Spenborough.—District Council. Supply of 1,000 tons each of coal for the electricity works for one year: W. Bennett and Sons, and W. H. Sharp & Sons.

Stoke-on-Trent.—T.C. Accepted tenders:—

British Westinghouse Co., Ltd.—3,000-kw. extension turbo-generator, &c. £18,805.

G. & J. Weir, Ltd.—10,000-gallon rotary feed pump, £381.

Aiton & Co., Ltd.—Pipes for cooling tower, £55 10s.

ANNEALING STEEL AND MELTING NON-FERROUS METALS IN THE ELECTRIC FURNACE.*

In a paper read before the CLEVELAND ENGINEERING SOCIETY, Mr. T. P. BAILEY said that the development of electric furnaces for the heating operations subsequent to the melting and refining of steel had been attended by the usual slow progress of any radically new development; the types now in operation were the result of the gradual elimination of weak and faulty features rather than of skill in original design.

The incidental advantages of the modern electric furnaces were so apparent that even at an equal operating cost for fuel, electricity now had the preference, while in some cases, where the net cost of operation with electricity was less than with gas or other fuel, complete installations of magnitude were being made.

All of the furnaces described were of the so-called resistance type, and had, in the case of rectangular furnaces, two troughs made of carborundum fire sand located one on each side of the furnace, with carbon or graphite electrodes located at each end of each trough. The troughs were filled with a broken carbonaceous material called "resister material" establishing a connection between the electrodes and completing the electric circuit. The general plan of these furnaces was similar to a closed box of fire brick in the walls of which were two glowers, which might be likened to huge incandescent lamp filaments. The control of the current, and hence the heat, was effected by varying the voltage impressed on the electrodes, this variation being obtained by means of numerous taps on the secondary of a special transformer supplied with each furnace.

A car-type 150-kw. annealing furnace, with the capacity of heating 1,000 lb. of steel to a temperature of 1,650 deg. F. in one hour, had a consumption of 300 kw.-hours per ton of material heated to that temperature. The door of the furnace was a heavy casting faced with fire brick, and backed by a filling of loose kieselguhr held in place by a steel plate.

A furnace of the same type, but of 300-kw. capacity, in the same plant as the previously described furnace, was used for annealing steel castings. Furnaces of this type were well adapted for handling steel castings and heating large or irregularly shaped forgings, or for the annealing of copper and aluminium, to which use they had already been put.

When materials were of uniform size, or of such shape and nature that they could be pushed along mechanically, or placed in containers of uniform size, the continuous furnace was sometimes preferable to the car-type annealing furnace. A 120-kw. furnace was used for carbonising rifle receivers in one of the large rifle-making plants in the East. The parts to be carbonised were placed in the usual pots and pushed through the furnace by means of pushers.

Other furnaces of the same general type, but with a different type of pusher, were used for annealing brass and German silver flatware blanks in one of the oldest and best known plants making plated tableware. Two of these 200-kw. units in operation at this plant had an hourly capacity of one ton of brass each.

The heat treatment of steel, as distinguished from the simple annealing operation, consisted of heating the metal to above a critical point, quenching at that temperature in some cooling medium, such as water or oil, and subsequently reheating to a temperature under the critical point mentioned.

For the highest quality of work in heat treating, two furnaces were recommended, each one running at the ruling temperature desired in the material at that particular stage of its treatment, and a quenching bath (or spray, as the case might be) located between the discharge end of the first or heating furnace and the charging end of the second or drawing furnace.

Two sets of two furnaces each were already installed in a progressive manufacturing plant, for the heat treatment of cast-steel drawbar knuckles. Each set had a capacity of 72 tons of steel per day, and consumed 900 kw.

These particular furnaces, and a similar set of 600 kw. furnaces for heat-treating large high-explosive shells, were automatically controlled by special pyrometers, so that the only hand work required was the placing of material on the charging platform of the first furnace of the set.

The reliability of the type of furnaces described above for annealing and heat-treating work seemed to justify the assumption that with the necessary modifications as to hearth and shape of furnaces they would work equally well on non-ferrous metals. The first furnace for this purpose was installed three years ago for melting silver in one of the plants mentioned previously, where continuous annealing furnaces were used for annealing brass flatware blanks. This furnace was rectangular in shape, and provided with a hole in the top and the necessary cover. The metal was melted in crucibles, the furnace being adapted to hold two crucibles of size No. 10. Not only was silver melted, but scrap copper as well. The ruling temperature of the furnace was 2,500 deg. F., very hot metal being required, as the castings were small and the moulds heavy iron chills.

There seemed to be no real necessity for the use of a crucible excepting in the melting of precious metals. Their high cost, rapid destruction, and the necessity of handling small quantities of metal when they were used, with attending high labour charge, had led to the adoption of a tilting-hearth furnace. This type of furnace was first used for aluminium and aluminium alloys, and later the same type, with slight modifications in the details, had been used to melt brass.

This furnace, with a normal rating of 105 kw., and a melting capacity of 600 lb. per hour, had melted, and superheated to a suitable pouring temperature, the following materials, with an average energy consumption as noted below:—

New red brass.—400-lb. heats in 1 hr. with 90 kw.-hours, or 450 kw.-hours per ton.

Scrap yellow brass.—(72 per cent. Cu, 28 per cent. zinc) 750-lb. heats in 1 hr. 10 min. with 120 kw.-hours or 320 kw.-hours per ton.

Scrap yellow brass.—(70 per cent. Cu, 30 per cent. zinc) 800-lb. heats in 1 hr. 18 min. with 110 kw.-hours or 275 kw.-hours per ton.

Brass chips and borings.—(70 per cent. Cu, 30 per cent. zinc) 700-lb. heats in 2 hr. 30 min. with 220 kw.-hours or 720 kw.-hours per ton.

Of all the electric furnaces of the type described now developed, the tilting-type furnace was the one offering the greatest saving in cost over fuel-fired furnaces of any type, whether oil, gas, or coke fired, since the metal loss was lower, the crucible cost was eliminated entirely, while the labour item was less on account of size and convenience of operation.

The following figures might be safely taken as operating conditions with yellow brass in a shop operating 24 hours per day:—

	Per ton.
Electricity, 400 kw.-hours per ton at 1 c. ...	\$4.00
Metal loss, 1 per cent. zinc at 10 c. per lb. ...	2.00
Labour, 1 man per hr. per 600 lb., at 40 c. per hr. ...	1.20
Renewals and repairs ...	1.00
Total per ton of melt ...	\$8.20

It was believed that the performance of these brass-melting furnaces was such, and the saving over other methods so great, that their introduction would be rapid, even more so than in the case of the annealing and heat-treating furnaces described, which were now accepted without question.

NOTES.

The British Engineers' Association.—The fifth annual ordinary general meeting of this Association was held at Caxton Hall, Westminster, London, on July 26th, and was attended by a large number of representative members from many parts of the country. In moving the Council's report, balance-sheet, and income and expenditure account for the year ending December 31st, 1916, which had been issued to all members, the chairman (Mr. Wilfrid Stokes) reviewed the work done by the Association during the past year, and dealt with the action which it was proposed to take in future. The new memorandum and articles of association, which had been revised in accordance with the resolution passed at the extraordinary general meeting of the Association on July 13th, 1916, had received the sanction of the Courts, and were now operative. He reminded members that the memorandum and articles had been revised in order to strengthen the relations between manufacturing engineers and those bodies and individuals with whom they were naturally brought into contact in the course of their business, as set out in the Manchester scheme for the organisation of the British engineering industry. He pointed out that much interest had been shown in the election of the new Council, and for the 30 seats on the Council, about 90 members, including retiring members, were nominated in the various districts, a total of 1,369 votes being recorded.

At the first meeting of the Council, held the same day, Mr. Wilfrid Stokes was re-elected president, and the Council for 1917-18 stands as follows:—

President: Mr. Wilfrid Stokes.	
Vice-Presidents: Mr. T. O. Callender, Sir John Cowan, Mr. Peter Denny, Mr. Herbert Marshall, Capt. L. E. Mather, Mr. J. E. Thornycroft, and Mr. Douglas Vickers.	
Mr. Daniel Adamson	Joseph Adamson & Co.
Mr. H. Alcock	W. T. Glover & Co., Ltd.
Mr. H. Austin	Austin Motor Co., Ltd.
Mr. Stanley Brotherhood ..	Peter Brotherhood, Ltd.
Sir Edwin Grant Burs, C.S.I. ..	Vulcan Foundry, Ltd.
Mr. George Cradock	George Cradock & Co., Ltd.
Mr. Robert Goudie	Loudon Bros., Ltd.
Mr. John Hemming	F. H. Lloyd & Co., Ltd.
Dr. G. B. Hunter	Swan, Hunter, and Wigham Richardson, Ltd.
Mr. John Hunter	Sir Wm. Arrol & Co., Ltd.
Mr. A. Jacob	British Aluminium Co., Ltd.
Mr. Christopher James	Joshua Buckton & Co., Ltd.
Mr. J. R. C. Kearns	H. W. Kearns & Co., Ltd.
Mr. B. Longbottom	Electromotors, Ltd.
Mr. Hugh Lupton	Hathorn, Davey & Co.
Mr. C. P. Martin	C. A. Parsons & Co., Ltd.
Mr. A. E. Owen	Rubery, Owen & Co.
Mr. Henry Steel	Steel, Perch & Tözer, Ltd.
Mr. T. Cuthbert Stewart ..	Stewart & Lloyds, Ltd.
Mr. H. J. Ward	J. & E. Hall, Ltd.
Mr. J. C. Ward	Edgar Allen & Co., Ltd.
Mr. A. P. Wood	Lancashire Dynamo & Motor Co., Ltd.

* Metallurgical and Chemical Engineering.

The Metric System.—According to *l'Industrie Electrique*, China will be the next convert to the metric system. Since February 15th the shops in Peking have adopted metric measures, authorised by the Chinese Chamber of Commerce under the instructions of the Ministry of Agriculture and Commerce.

A New U.S. Carbon Electrode Factory.—Work has been started on the first unit of a new factory that will form an immense addition to the present large plant of the Speer Carbon Co. at St. Mary's, Pennsylvania, and which, when entirely completed, will involve the expenditure of approximately £100,000 for additional land, buildings, machinery, equipment, and general improvements.

The first building, which will be devoted exclusively to the manufacture of the larger-sized carbon electrodes for electric furnaces will be 100 x 168 ft. (30.5 x 51.2 m.) in size, constructed entirely of brick, concrete, and steel. Glass sidewalls will also be employed, thus admitting daylight throughout the entire structure. It is expected that the entire plant will be in full operation by September next.

The Speer Carbon Co. has for several years past manufactured carbon electrodes in the smaller dimensions, the maximum sizes including 4 in. square and 6 in. diameter. The new factory will be equipped to turn out both round and square electrodes in all sizes from 6 to 24 in. in diameter.

The demand for carbon electrodes is daily increasing, the condition being caused by the enormous demand for tungsten steel and other products which, in turn, necessitated the installation of large numbers of electric furnaces throughout the entire country. The requirements of the Government have also influenced the Speer Carbon Co. very largely in the erection of a new plant.—*Metalurgical and Chemical Engineering*.

The Industrial Progress of Spain.*—For many years Spain has been depending upon England, France and Germany for goods of all kinds. These countries, and principally Germany, have dominated the Spanish market, due to their commercial organisations, to the establishment of branches of French, English and German banking institutions, to the facility with which the European manufacturers adapted themselves to trade conditions in Spain, to their sending out of Spanish-speaking salesmen, to the establishment of branch offices with goods on consignment and the granting of easy terms of payment. People in Spain have always been accustomed to having prices quoted, delivered in Spain, duty and freight paid. It has always been customary in dealing with substantial firms to grant from three to six months' credit against acceptance of drafts.

With the outbreak of the European War the country was suddenly cut off from its accustomed sources of supply, and a great paralysis of industrial life in Spain started on account of the disorganisation of the market. Slowly during the second year only of the war, Spanish industries began practically to realise to what extent they had been depending on foreign markets, and chiefly due to individual efforts, industrial life in Spain acquired in many branches a degree of activity never attained in previous peace times.

Spain is to-day a country in which electricity is developed to an astonishing extent. The cities of Madrid and Valencia are supplied with more than 40,000 H.P. produced by hydro-electric plants. In the district of Barcelona a company, largely managed by American interests, has just finished a concrete dam, 330 ft. high and 700 ft. long, the largest in the world, with an electric power plant producing to-day about 20,000 H.P. In the same district a French concern is building in the Pyrenees another hydro-electric plant, to bring 30,000 additional H.P. into the industrial district of Barcelona.

The principal industries in Spain, up to the present, have been the following:—Mining, textiles, lace, sugar, cement and gypsum, pottery, the steel industry of Toledo and Eibar, and shipbuilding. A prominent industry created in Spain in recent years is the railroad and tramway car-building industry. There are five factories in Spain, two of which are very important: Barcelona and Bilbao possess large blast furnaces and steel mills manufacturing rails, structural shapes, steel and tin plate.

An important automobile factory, turning out one of the best-known cars in Europe, exists in Barcelona, and a new truck factory is now under construction for the purpose of building 2,000 trucks and tractors per year.

In the Barcelona district alone the following new industries, with products for which the country always has been dependent on Germany, England and other countries, have been created: rolling mills for sheet-metal and structural shapes, tin plate, factories producing enamels and ironware, electrical supplies and motor factories, textile machinery, machine-tool woodworking and metal-working machinery. New plants have been erected, and several million francs have been invested in these new industries lately. In the last two years several new factories have been created with the exclusive object of specialising in the manufacture of machine-tools, chiefly lathes, drilling machines and presses. In electrical material, lighting fixtures, large motors and generators, Spain has always been entirely dependent upon Germany and France for her supply. The Government intends to promote the installation of all kinds of industries supplying the country's needs in electrical material.

The industrial awakening of the country will, for the next 10 years, necessitate the establishment of factories that will require raw materials and machinery, tools and equipment.

* *American Machinist*. Extracts from an address delivered by H. S. Moos before the Foreign Trade Bureau of the Cincinnati Chamber of Commerce.

Low-Priced Lighting Fittings of Steel.—The *Electrical World* says that a brisk demand for low-priced lighting fittings has led a number of fittings manufacturers to place on the market a new line of fittings of the same design and appearance as expensive fittings, but produced to sell at a very low price. The secret of the low price is steel. In place of brass, which is used in the more expensive fittings, pressed steel with a brass finish is employed. This increased demand is coming from the labouring people, who during the last year and-a-half or more have been earning high wages. The demand for more expensive fittings has fallen off perceptibly, since the buyers of this class of goods are the salaried men. The labourer, however, has now more money than he ever had before, and consequently one of the trades to feel this increased buying power is the fittings trade.

Electrical Enterprise in Spain.—Under the style of Sociedad Espanola de Construcciones Electromecanicas, a company has been formed, with a capital of 25,000,000 pesetas, for the erection of works at Cordoba for the construction of all kinds of electrical machinery; 15 hectares (37 acres) of land have been acquired, and the aim of the promoters will be to render Spain independent of foreign importations. The capital is mainly Spanish, but French and English support is included, and apparently German, as the firm of Bauer is mentioned. The French promoters include the Creusot establishment, the firm of Fougere, and the Union Parisien Bank.

Peat Fuel at Moscow Electricity Works.—The Assistant Minister of Trade and Industry, N. N. Savin, has proposed to the Provisional Government to grant a loan of 2,000,000 roubles to the Elektro-peredatch (Electrical Transmission) Co., Moscow, for a period of nine months, at 8 per cent. annual interest. The memorandum accompanying the proposition states that the company delivers 40,000,000 kw.-hours per annum, almost entirely for industrial purposes, the fuel for the production of which consists of the company's peat deposits. In the current campaign the company contemplates using 113,000 tons of air-dried peat, and the wages of the peat workers have risen about threefold. It is the increased wages list, that necessitates the advance of cash asked for. The difficulties of the company were further accentuated by the Revolution having broken out just when the station was in course of construction, and the plans made earlier for financing the concern could not be carried out, owing also to the proposed elimination of foreign capital interests. The Minister adds that last year 70 per cent. of the work done by the company was for the national defence, and a considerable percentage of the energy delivered by the Moscow 1886 Company could, if the peat were properly exploited, be delivered by the Elektro-peredatch, and a corresponding consumption of petroleum be avoided. For the reasons stated, the Ministry considers that the loan requested should be granted.

Large Gas Engines in U.S.—The opinion seems prevalent, based probably on conditions a few years back, that the large gas engine is rapidly on the decline, and will soon be a thing of the past. Therefore, many will be surprised to learn that there are now in course of construction a large number of these units for at least four of the biggest steel plants in the country. Some of these engines will be of more than 1,000 H.P., and will be employed both for blowing and for driving electric generators. It appears then that the large gas engine business was merely lying dormant, awaiting the impetus to the steel industry which has been supplied by the conditions arising out of the war.—*Power*.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Bahlerton Street, Oxford Street, W.

Orders for the week, by Lieut.-Colonel C. B. Clay, V.D., commanding:—

Monday, August 13th.—Technical instruction (searchlight) for No. 3 Company, Right Half Company, at Regency Street. Drill, No. 3 Company, Left Half Company, Signalling Class. Recruits' Drill, 6.30.

Tuesday, August 14th.—Lecture, 6.30. Physical drill and bayonet fight ing, 7.30.

Wednesday, August 15th.—Drill and elementary bridge construction, No. 1 Company, Right Half Company.

Thursday, August 16th.—Drill and elementary bridge construction No. 2 Company, Right Half Company. Ambulance Class.

Friday, August 17th.—Technical instruction (searchlight) for No. 3 Company, Left Half Company, at Regency Street. Drill, No. 3 Company, Right Half Company. Signalling Class. Recruits' Drill, 6.30.

Musketry.—All N.C.O.'s and men who have signed the "A" and "B" agreements are required to attend during this month to re-classify in order to enable the Corps to obtain the Capitulation Grant. Preference will be given to these men in firing.

Armlets.—The new issue armlets can now be obtained at Headquarters, and every enrolled man must obtain one without delay, and all old (red) armlets must be returned to the Orderly Room.

Note.—Unless otherwise indicated, all drills will take place at Headquarters. (By order) MACLEOD YEARSLEY, Adjutant.

Parliamentary.—The Electric Lighting Orders Confirmation Act, 1917, and the Companies (Particulars as to Directors) Act, 1917, have received the Royal Assent.

The Engineers' Award.—The Leyton Council raised a point as to whether the Committee on Production award applied to electrical workers, and has received the following letter from the secretary of the Committee on Production:—

"In reply to your letter of July 17th, the findings of the Committee on Production to which you refer affect directly only the establishments of members of the Engineering Employers' Federation, the arbitration proceedings in each case having been between the Engineering Employers' Association and the Trade Unions.

"The question of the application of those awards to a certified municipal electricity undertaking is not one upon which this Committee is able to advise. The Committee is an Arbitration Tribunal, and it can deal only with cases that are referred to it by the Ministry of Labour."

Electro-Culture.—As previously mentioned in these columns, Mr. E. M. Ashley, of Southport, is experimenting with electro-culture on an allotment at Crowlands, and expresses himself as confident in its success. He records good results with early crops, and mentions that the cost of electricity is about 1d. per day.

A similar experiment of a more ambitious nature is being undertaken by the Liverpool authorities at Calderstones Park, where an acre of ground has been initially equipped. The crops comprise a variety of vegetables and oats, and some 300 sq. yards of the ground is being treated on allotment lines, a similar control plot being provided for purposes of comparison. Although the experiment has only run a few weeks, the electrified crops have a healthier appearance than those in the control area.

In North Wales, an electro-culture equipment has been set up by Sir Thomas Roberts in his vegetable gardens at Plasbryn, Carnarvon. The equipment is run from a 220-volt circuit supplying the house, and the discharge wires are fixed at a height of 7 ft. above the ground. It is stated that the energy supplied to the primary terminals is 450—460 watts per acre, and also hinted that the owner contemplates experimenting with field crops later on.

National Insurance (Unemployment) Acts, 1911 to 1916.

—**Unemployment Insurance.**—A. The Umpire has decided that contributions are payable in respect of:—

2,366 X. Students at technical institutes receiving training under arrangements made by the Ministry of Munitions.

B. The Umpire has decided that contributions are not payable in respect of:—

2,364 Workmen engaged wholly or mainly in wolfram streaming.

2,365. Workmen engaged wholly or mainly in printing, enamelling, varnishing, or similarly treating tin-plate prior to its being cut into sizes suitable for making boxes or canisters.

The Electrolytic Pickling of Steel.—Messrs. M. De K. Thompson and O. L. Muhlman, in a paper read before the American Electrochemical Society, state that all iron and steel objects which in the process of manufacture have been heated in the air are covered with "fire scale," which is an oxide of iron. This has to be removed before the surface can be plated or galvanised. The usual practice has been to immerse the objects in some acid until the scale is removed by the hydrogen formed by the action of the acid on the iron beneath the scale, which it reaches through the cracks in the scale. The action which would be expected if a sheet of iron covered with scale were used as a cathode in an acid solution is a reduction from a higher to a lower oxide. This oxide would be dissolved by the acid. There would also probably be a certain amount of chemical action between the iron under the scale and the acid, as in the purely chemical treatment. It is this action which the electrochemical process attempts to avoid as much as possible. The method of comparing the two operations consisted in treating two similar mild steel plates by the two methods until their appearance showed that the pickling was completed. In two experiments the saving effected, in acid and the amount of iron removed, for every 2,000 lb. of iron, including the cost of power, was about \$70, and in a third about \$50. These results point to important economies that may result from the adoption of the electrolytic method.—*Franklin Inst. Journal*.

A Log of Domestic Electricity Supply.—A recent article in the *Electrical World* contained some detailed figures as regards the daily use of domestic appliances by a family of two. A separate meter was installed for each of 10 different devices, another meter on two little used devices, and another for lighting. All cooking and heating of water was done electrically, but the water was heated, as required, by an immersion heater, which is said to act rapidly enough to make a fair substitute for a permanent hot water supply. It was impossible to segregate energy used for heating water, but the energy so used would be proportional to the number of times the disk stove and immersion heater were used for water heating, and this indicated a consumption for water heating of 375 kw.-hours, or 25 per cent. of total energy used for all purposes. The use of one outlet per device worked well, except for the immersion heater and the installation of a suitably worked double-throw switch, obviated the necessity of two outlets for this device.

The article contains tabulated data in regard to ratings and consumption for the year, month, &c., and number of times the device was used. Twelve lamps of 530 watts were in use, and 171 kw.-hours were consumed during the year. Percolator and samovar: used 81 times; 9 kw.-hours used. Toaster stove: used 351 times; 39 kw.-hours. Frying pan: used 586 times; 122 kw.-hours. Immersion heater: used 910 times; 272 kw.-hours. 9-in. disk stove: used 171 times; 371 kw.-hours. Oven: used 238 times; 129 kw.-hours. Fan: used 30 times; 1 kw.-hours. Sewing-machine motor: used 61 times; 2 kw.-hours. Iron: used 107 times; 51 kw.-hours. Bathroom radiator: used 18 times; 22 kw.-hours. The total connections made for using this apparatus (apart from lighting) were 2,856, which represents an average of 161 kw.-hour used for each connection. The total kw.-hours used for all purposes were 1,498.

The maker's rating in watts of the above apparatus was:—Percolator, 140; samovar, 110; toaster, 500; frying pan, 660, 330, or 165; immersion heater, 600; disk stove, 1,200, 600, or 300; oven, 2,000, 1,000, or 500; 12-in., three-speed fan (no loading given); sewing machine motor, $\frac{1}{2}$ h.p.; iron, 150; bathroom radiator, 1,500, 750, or 375 watts.

It will be noted as one would expect, that the oven and disk

stove used the bulk of the energy—i.e., 429 and 374 kw.-hours respectively; the immersion heater used only 272 kw.-hours. The bathroom radiator, though, it only accounted for 22 kw.-hours during the year, took 18 kw.-hour on the average each time it was used.

Attention is drawn to the value of the figure for average consumption of all appliances (3461 kw. hours) each time apparatus was used, and it is remarked that such devices as fans, sewing-machine motors, heating pads, &c., do little to increase the energy used, though they serve to popularise electric service.

Porcelain Pyrometer Tubes.—For the purpose of protecting thermo-couples at furnace temperatures the tubes made of Marquardt refractory porcelain by the Royal Berlin Porcelain Manufactory have proved very successful, as is shown by the experience of many years. These protection tubes, owing to war conditions, are now not obtainable.

The need of effective protection for the costly platinum and its alloys so extensively used in pyrometry prompted investigation and manufacture in the United States. The Ceramic Section of the National Bureau of Standards carried on experiments for the purpose of reproducing, and, if possible, of improving upon the Marquardt porcelain. The result was a highly refractory product which, though made entirely from American raw materials, was found to be of most excellent quality. The manufacture of this porcelain was taken up by the Stupakoff Laboratories of Pittsburgh, Pa., who successfully overcame the unavoidably attendant difficulties, and brought on the market a protection tube under the name "Usalite."

It is claimed by the manufacturers that tubes of this material will readily withstand exposure to temperatures exceeding 1,650° C. A highly refractory glaze covers the surface of the outer pyrometer tubes, in order to make them impervious to gases of combustion.

Usalite tubes, when withdrawn from white-hot furnaces, and brought into the open air, neither broke nor cracked. The smaller diameter unglazed tubes effectively withstood sudden exposure to highest temperature. A glazed outer tube heated to 1,100° C. readily withstood the introduction of cold steel rod of nearly the same diameter as that of the bore of the tube.—*Met. and Chem. Engineering*.

Electric Loom Brake.—Mr. J. F. Crowley, Blackwater Mills, Rathmore, Co. Kerry, has been granted a patent (106,663) for an invention relating to electric and magnetic brakes. A solenoid is energised to take off the brake when the motor switch is closed, and the switch is held closed by a trigger device which can be released manually, or by a safety device on the (electrically-driven) loom, or by failure of the current. The solenoid may be short-circuited after the brakes have been taken off thereby, and the brakes may be held off by a second trigger, which may be connected to the switch-trigger device.

A Cardiff Electrical Dispute.—Mr. McWhirter presided at a special conference, held on Friday at Cardiff, concerning the strike of about 300 members of the Cardiff Electrical Trade Union. Members of this body met the representatives of the National Federated Electrical Association and Mr. Palgrave Simpson, head of the labour and wage section of the Ministry of Munitions. The whole matter of the dispute was carefully considered. The statement of the members of the Trade Union is that an award was made on June 8th placing the electricians on the same level as the allied engineering trades. The men came out owing to a different reading of the awards granted by the Committee on Production on this date, which gave the men 12s. per week more than pre-war rates. Consequently, notice was tendered to the employers that labour would be withdrawn if the awards were not observed. As the notice terminated on Thursday, about 300 men came out on strike. It has been stated that notice was also tendered to the Ministry of Munitions, but this is denied by the members of the National Federated Electrical Association. In the afternoon session the employers and Union representatives met, and the men agreed to resume work, the matter being referred to the Chief Industrial Commissioner (Sir George Askwith), with a view to arbitration as early as possible.—*Western Mail*.

Appointments Vacant.—Dynamo attendants (38s.) for the Manchester Corporation Electricity Works; shift engineer, for the City of Peterborough Electricity Department. See our advertisement pages to-day.

London Association of Foremen Engineers.—A set of rules for conducting the business of meetings has been drafted and printed.

Electro-Chemically Produced Petrol.—In view of the scarcity and high price of petrol in this country at the present time, it is interesting to learn from New York that Mr. Louis Bond Cherry, who is described as a member of the American Institute of Electrical Engineers and of the American Electro-Chemical Society, is stated to have invented an electro-chemical process for producing synthetic petrol from kerosene or paraffin, at a cost of 3d. per gallon. Mr. Cherry describes his process as the successful application of the electromagnetic theory of matter by mixing hydrocarbons; it is also stated that an experimental plant capable of converting 60,000 gallons per day has been established, where 78 per cent. of the kerosene treated has been converted into petrol of a sufficiently high quality to run the engines of motor vehicles. It is added that further experimental work is in hand in connection with the proper length and diameter of the treating chambers.

Electric Steel.—In the issue of *La Nature* for July 14th, a description is given of the work being carried on at the Keller factory at Livet for the production of "synthetic pig-iron." As long ago as 1908, M. Keller took out a patent for a process of manufacturing synthetic pig-iron, consisting of the introduction of measured quantities of carbon and silicon into a molten bath of steel turnings. In order to improve the method, the Keller Co. was formed in 1915. The first work was the manufacture of steel-quality iron for shells. The works were extended, and this work was carried on more extensively. In the latest development M. Keller melts the turnings by the continuous process, in special electric furnaces, to obtain a steel with a carbon and silicon percentage higher than that finally required. The steel which is worked up is transferred to a refining furnace. With the new method the advantages are two. In the first place, the desulphurised and supercarburised steel, containing any required proportion of silicon, is obtained by continuous fusion, with maximum thermal efficiency, in the electric furnace. The work does not require the employment of specialists, and the energy consumption per ton does not exceed 600 kw.-hours. Secondly, the refining furnace gives a good yield per hour. The dephosphorisation process is carried out in a second operation. M. Keller has generously placed his invention at the disposal of the French Government, and a national factory has recently been erected somewhere in France to produce 300 tons per day.

Northampton Polytechnic Institute.—Particulars of the Engineering Day Classes and Courses in Technical Optics for the next session appear in our "Official Notices" to-day.

Australian Brown Coal Deposits.—The recent report of the Brown Coal Sectional Committee of the Institute of Victorian Industries, which has been investigating the utilisation of the Victorian brown coal deposits, much in the same way as the Canadian Advisory Council on Industrial Research, is doing in connection with the immense lignite deposits of the Dominion, contains some interesting features. The following is a synopsis of data contained in the report:—

Brown Coal Uses.—(1) To supply electrical power to Melbourne and other parts of the State; (2) briquette making for household and other requirements; (3) producer gas, town gas, tar and its derivatives, ammonia, and coke.

Power Production.—The Melbourne City Council and Melbourne Electric Supply Co. can at present supply a maximum of 28,000 h.p. Requirement in 1925, estimated from normal increase, 120,000 h.p. This estimate is for Melbourne alone, and does not allow for new industries made possible by cheap power. Electrolytic treatment of zinc concentrates may absorb 200,000 h.p.

Costs.—Newcastle slack coal costs 20s. per ton. Estimated cost of Morwell coal, 2s. 3d. per ton at mine. Morwell coal, with 40 per cent. moisture, has 0.116 the heat value of Newcastle coal. Electrical energy produced at Morwell by 5s. 5d. worth of brown coal equals amount produced in Melbourne from 20s. worth of Newcastle coal, and can be transmitted to town at about half the fuel cost of the latter. Victoria pays 10s. more per ton for black coal than New South Wales. The electrical power scheme will remove this handicap.

Briquetting.—Morwell briquettes need no binder, and can be produced at from 11s. to 13s. per ton. They can be sold to householders in Melbourne and suburbs at about 24s. per ton, as against 24s. 6d. for wood, 32s. 6d. for coke, and 35s. for black coal. Estimated cost of single-press plant, £15,000 to £20,000.

The report goes on to recommend that immediate State action be taken:—(1) to confirm estimates in regard to public power requirements, and the best means of satisfying these by electrical energy generated from brown coal; (2) to decide what authority shall do the work, and when; (3) to obtain estimates of the cost of:

(a) 50,000-kw. plant at Morwell, and of similar plant at Altona, with transmission line, &c., in each case.

(b) Opening up workings at Morwell, and equipping them to produce coal for a 50,000-kw. power station, and to supply 120 tons of briquettes a day.

(c) A briquetting plant, starting with a one-press unit of 60 tons a day capacity, with arrangements for ultimate expansion to six or seven presses.

(4) That two experts should be sent abroad immediately to investigate latest power plant practice, and equipment necessary to secure full utilisation of Victorian brown coal resources.

The State Cabinet has now decided to obtain the advice of a committee of experts, including Mr. H. R. Harper, city electrical engineer, Melbourne; Mr. W. J. Clements, manager Melbourne Electric Supply Co.; Mr. W. Stone, electrical engineer to the railways; and Mr. H. Herman, of the Geological Survey: on the best means of developing the deposits.

Fatalities.—An inquest was opened last Saturday regarding the death of Private Samuel Cowsill (23), 6th Manchester Regiment, who had been sent as an electrical engineer to work in connection with the installation at a new munition factory. On August 2nd, while engaged in wiring 20 ft. above the floor, he was using a blowpipe, which burst and burnt him severely about the face and chest. He fell in a heap on the floor, and was taken to the infirmary, where he died next day. The inquest was adjourned till August 10th, so that the Factory Inspector and witnesses could attend.

An inquest was held at Liverpool concerning the death of George Ferdinand Corfe (28), who was killed at Bibby's Copper Works, Garston, where he was working a pneumatic hammer. According

to the *Liverpool Courier*, the air compressor was driven by electricity. The fuse-box was about 10 ft. from where he was working, and he was found dead in a crouching position on the floor with a fuse holder in his left hand. It was presumed he had gone to the box to replace a fuse, and had received a shock. This, it was stated, was no part of his duty, and the men were warned against interfering with the electrical installation. The jury returned a verdict that death was accidental and was due to electric shock, caused by deceased interfering with the fuse-box.

American Electric Brougham Test.—Our contemporary, the *Electrical Review and Western Electrician*, contains particulars of a speed and endurance test carried out with a Baker R and L stock vehicle, between Atlantic City and New York, under the auspices of the New York Electric Vehicle Association. The time taken was 5 hours and 58 minutes, showing an average running speed of 20.5 miles (33 km.) an hour, over the journey of 123.5 miles (199 km.). The entire distance was covered with the car running at fifth and sixth speeds. One of the startling disclosures brought out by this trip was that the energy used cost less than half the price of gasoline for the same work. Some 283 ampere-hours were used, or an average of 2.29 per mile (1.41 per km.), which at 5 cents (2½d.) per kw.-hour—the maximum charging rate in New York—would make the cost \$1.55 (6s. 6d.).

Time Signals by Electric Lights.—A new kind of time signal has recently been installed at the Hector Observatory, Wellington, New Zealand. Three electric lamps are mounted in a vertical row on the Observatory flagstaff, 6 ft. apart; the lowest green, the middle red, and the highest white. The lights are switched on 50 minutes, 10 minutes and 5 minutes, respectively, before the hour of the signal, at which hour they are all extinguished simultaneously. The signals are given at 20 hours, 21 hours and 22 hours, Greenwich mean time.—*Scientific American*.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—Blackpool Electricity Committee has considered an application from the Coal Mines Department of the Board of Trade for the services of Mr. CHARLES FURNESS, the borough electrical engineer, in rendering part-time assistance in visiting certain local authorities in Cumberland and North Lancashire with the object of discussing fuel economies and submitting reports thereon to the Board. The matter has been left to Mr. Furness to act as he may think best.

Burnley T.C. is increasing the salary of Mr. H. MOZLEY (general manager of the tramways department) from £450 to £500 per annum.

On Tuesday, the Exeter City Council unanimously adopted a resolution expressing entire confidence in Mr. MUNRO, electrical engineer, and warm appreciation of the ability he had displayed in the management of the undertaking. This decision was taken in justice to the engineer after the vote at a previous meeting, when, by 23 to 19, it was decided to reject the unanimous recommendation of the Electricity Committee to advance Mr. Munro's salary of £175 per annum. Ald. Reed (Chairman of the Committee) said that body had not met since the Council dealt with the matter, but the members were very angry at the way they had been flouted, and it was quite possible they might resign in a body by way of protest.

Sunderland T.C. on Wednesday agreed to the application of the Board of Trade (Coal Mines Department) for the partial use of the services of the general manager of the electricity department, temporarily, in connection with economy in coal consumption.

Mr. REGINALD XENAKY, lately of the Yorkshire Electric Power Co., has been appointed technical assistant to the station superintendent at the Salford Corporation electricity works. Mr. FRED VALENTINE, of Salford, has been appointed secretary to the borough electrical engineer.

General.—The Controller of Coal Mines has appointed Mr. FRANK PICK, commercial manager of the London Electric Railways, as his assistant to deal with matters in connection with the London coal distribution scheme.

At the head office of Messrs. Ellis & Ward, Ltd., Portugal Street, Kingsway, on July 31st, Mr. C. W. V. CLARKE, London manager, and Mr. H. FOWKES, of the engineering staff, the former having completed 21 years and the latter 22 years of continuous service with the company, were presented with gold half-hunter watches with engraved inscriptions. Mr. H. Willoughby Ellis, managing director, made the presentation.

Mr. A. W. ASHTON, D.Sc., M.I.E.E., has been appointed Principal of the Mechanical and Electrical Engineering De-

partment of the Stoke-on-Trent Central School of Science and Technology.

Lieutenant J. S. B. PLUMMER, who has just returned to France, joined the Surrey Yeomanry (Queen Mary's Regiment) at the outbreak of war, and later transferred to the Leicestershire Regiment, from which he was recommended for a commission. Lieutenant Plummer was formerly a representative of W. T. Henley's Telegraph Works Co., Ltd., in the Midlands.

SAPPER HARRY JONES, of the 3rd Electrical Section, R.E., who before the war was partner in the firm of Frederick Thomas & Co., asks us to state that he is not the Sapper Harry Jones whose death has occurred at Longmoor. He is well, and usefully employed in France.

Roll of Honour.—Private A. COYLE, of the Manchester Regiment, killed in action, was with Messrs. Brankingham Bros., electrical engineers, Sunderland.

Lieutenant J. N. PAYNE, who joined the South African Infantry as a private, and who has died of wounds received in action in East Africa, was formerly on the staff of Messrs. Bruce Peebles, Ltd., of Edinburgh, and just prior to the war he accepted a position at a power station at Johannesburg, South Africa.

Armourer's Mate A. J. WALLACE, who was lost by the explosion on H.M.S. *Vanguard*, joined the Navy whilst with Mr. W. D. Willson, electrician, of Croydon.

Gunner A. HOLT, aged 22, of the R.F.A., who has been killed in action, was employed at the United Electric Car Works, Preston.

Private B. METCALFE, K.O.Y.L.I., who has died in a French hospital, was formerly an electrical engineer in the employ of the Belfast City Tramways Co.

Private E. FRAME, of the King's Liverpool Regiment, killed in action, was employed by Messrs. Ward & Goldstone, Salford.

Second-Lieutenant O. V. MOSELEY, Lancashire Fusiliers, attached King's Liverpool Regiment, wounded and gassed, is the well-known North of England and Lancashire County lacrosse player. Before the war he was a representative of Messrs. C. Macintosh & Co., Ltd., electric wire and cable manufacturers.

Private R. C. STOCKWELL, Manchester Regiment, who has died from wounds received in action, was employed by Messrs. Dorman & Smith, Ltd., of Salford.

Gunner W. J. WOLSTENHOLME, R.F.A., reported wounded in action, was employed by Messrs. Jones Bros., electricians, Blackpool.

Sergeant S. WARD, South Staffs. Regiment, who enlisted from the Rugby works of the B.T.H. Co., has been awarded the Military Medal for gallantry.

Private W. H. DYCE, City of London Rifles, killed in action, was on the staff of the Ilford U.D.C. electricity works.

Private J. FLETCHER, North Staffs. Regiment, who has fallen in action, enlisted whilst with Messrs. Siemens Bros., Ltd., of Stafford.

Private R. HOLMES, Northumberland Fusiliers, who has fallen in action, was on the staff at the York Corporation electricity works.

Private J. ENTICOTT, Oxford and Bucks Light Infantry, employed at the Rugby works of the B.T.H. Co., has gained the Military Medal for gallantry whilst acting as a stretcher bearer.

Private T. CUNNINGHAM, Lancashire Fusiliers, killed in action, was on the staff of the Manx Electric Railway Co., Douglas.

Company-Sergeant-Major FENTON, of the Lancashire Fusiliers, a tramcar driver in the service of the South Lancashire Tramways Co., has been appointed to a commission as second lieutenant in the 3rd King's Liverpool Regiment. He joined up on the outbreak of the war, having been discharged on pension after a period of 21 years 150 days with the Colours. He saw service in the Dardanelles campaign, was subsequently transferred to Kantara, Egypt, and then to France.

Private L. SMITH, Scots Guards, who was employed at the Electrical & General Stores, Leeds, has been killed in action, aged 20.

Captain L. A. F. FOERS, who was articled as an electrical engineer to Mr. Priestley, the manager of the Mexborough and Swinton Tramways, has been wounded in action. Some time ago he was awarded the Military Cross.

We regret to learn that Captain JAMES GRIMSHAW CUNLIFFE, M.Sc. (Tech.), A.M.I.C.E., A.M.I.E.E., of the Manchester Regiment, died of wounds on August 1st. Three weeks ago he was awarded the Military Cross for bravery. Captain Cunliffe was educated at Acerrington Technical School and the Manchester School of Technology. After taking his degrees he entered the service of the Manchester Corporation tramways, attaining the position of assistant electrical engineer. He went from Manchester to a similar position at Birmingham, remaining there until the war broke out. Joining the Victoria (Manchester) University Officers' Training Corps in August, 1911, he received his commission in one of the Manchester Regiments ("Pals") on their formation. Besides being an active member of the Manchester Section of the Institution of Electrical Engineers, Captain Cunliffe was joint author with his brother, Mr. R. G. Cunliffe, M.Sc. (Tech.), in the publication of papers read before electrical associations.

NEW COMPANIES REGISTERED.

Etablissements de Dion Bouton Société Anonyme (1,596f.).

Particulars filed July 28th, 1917. Registered in France, January 28th, 1908, to exploit and develop the factories and undertakings founded by De Dion Bouton & Co., and carry on the business of manufacturers of and dealers in motors, mechanical implements, motor chassis, &c., and also to carry out transactions in metallurgy and various branches of the electrical industry. British address: 10, Great Marlborough Street, W. Messrs. Kenneth Brown, Baker & Baker, of Lennox House, Norfolk Street, W.C.2, are authorised to accept service.

Piggott Electrical Co., Ltd. (148,132).—Private company.

Registered August 1st. Capital, £5,000 in £1 shares. To take over the business of the Piggott Electrical Co., the Piggott Conduits & Cable Co., and the Piggott Electrical Lift Co., carried on by George and Sarah Piggott at 24, New Bridge Street, E.C. The subscribers (each with one share) are: Geo. E. Piggott, 24, New Bridge Street, E.C.4, electrical engineer; Sarah Piggott, Loxwood, Woodcote Avenue, Wallington, Surrey. Permanent governing director, Geo. E. Piggott. Registered office: 24, New Bridge Street, E.C.

Brodmins, Ltd. (148,137).—Private company. Regis-

tered August 2nd. Capital, £2,000 in £1 shares. Electro platers, electro depositors of metal or other substances, enamellers and finishers of china, porcelain, earthenware, pottery, and glass, gold and silver refiners, gold and silversmiths, jewellers, manufacturers and dealers in novelties and fancy goods, metal toy manufacturers, &c. The subscribers (each with one share) are: F. H. Pepper, 34, Waterloo Street, Birmingham, solicitor; J. E. Smith, 78, Springfield Road, King's Heath, Birmingham, cashier. First directors are to be appointed by the subscribers. Registered office: 34, Waterloo Street, Birmingham.

S. T. Taylor & Sons, Ltd. (148,146).—Private company.

Registered August 2nd. Capital, £15,000 in £1 shares. To acquire the business carried on at Scotswood-on-Tyne as S. T. Taylor & Sons, and to carry on the business of manufacturers of and dealers in non-conducting cements and other coverings suitable for boilers, pipes, heated and other surfaces, and the insulation of ships, refrigerators, and buildings of all descriptions, builders' contractors, mechanical, electrical, aircraft, heating, and sanitary engineers, manufacturers of and dealers in chemicals, oils, colours, cements, and varnish, motor-car manufacturers, &c. The subscribers (each with one share) are: E. Taylor, Roseworth, Whickham, Co. Durham, cement manufacturer; S. T. Taylor, Holmroft, Grange Road, Newcastle-on-Tyne, cement manufacturer. The first directors are E. Taylor and S. T. Taylor, each of whom may retain office while holding 1,000 shares. Registered office: Tynes Works, Scotswood-on-Tyne.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Lamplough & Son, Ltd.—Satisfaction in full on July 10th, 1917, of mortgage dated May 16th, 1916, securing £1,200, has been filed.

Mander & Co., Ltd.—First mortgage debenture dated July 20th, 1917, to secure £400 and interest charged on the company's undertaking and property, present and future, including uncalled capital. Holder: Minnie Gertrude Mander, 38, Davey Road, Perry Barr, Birmingham.

CITY NOTES.

Crompton and Co., Ltd.

At the annual meeting, last week, the chairman said that he was sorry that they were not able to present at that meeting the accounts for the year ending March 31st, 1917, but, in deciding to postpone their publication, they were following the example of many other companies which, like themselves, were controlled establishments. He was able to say, however, that the turnover showed a very satisfactory increase on that of the previous year. Unexecuted orders at the works at the close of the year represented a very large amount—greater, in fact, than the total annual output a couple of years ago. The company's profit-earning capacity likewise continued to expand. With their increasing turnover, and with the continued rise in price of material, they still found it necessary to be conservative in the matter of distribution of profits, quite apart from the fact that they had the important question of war taxes to bear in mind. They felt, nevertheless, quite justified in recommending a distribution of 5 per cent. on the ordinary shares, in addition to the preference dividend. There was much talk of Labour unrest, but the relations between their company and its employees during the year had been entirely satisfactory. They had added considerably to the number of women employed—they were doing excellent work. Many of the staff at the works had had to put in long hours, but they had done it with a willingness which was much appreciated. If ever the employees had merited their thanks it was in respect of the work done in the past year. To Mr. Reeves, the managing director and secretary, and to Mr. Britten, the works manager, and now a director, were due their hearty thanks. To these two gentlemen, loyally supported by their efficient staff, was to be attributed the general improvement in the company's position. They had sustained a loss in the death of Mr. E. J. Erskine, their Aus-

tralian manager, who had been the head of the Sydney office for over 20 years. With regard to the future, they had plenty of work in hand, and this should mean satisfactory profits for the current year. They would publish the accounts for last year as soon as possible. No pains were being spared to arrive at final figures which they could place before them. In regard to the question of war taxation, this country was, in effect, a gigantic trading concern, and one result of the war was to dissipate a very large amount of the working capital of that trading concern. When the working capital of a business was reduced, that business was no longer able, with its smaller working capital, to do the volume of business that it previously carried on without embarrassment. It followed, in his opinion, that when the war was over very great efforts would be required of the commercial community to restore and augment the trade of the country. The Government, in their policy of war taxation, were paying too little attention to this all-important matter of the future rehabilitation of the country's trade, and he sincerely hoped that the many efforts which had been made by commercial men to impress upon the Government the importance of this point would not be without some effect.

French Companies.

The accounts of the *Société Westinghouse* for 1916 show net profits of £76,000, as compared with £12,000 in the previous year, and with the amount brought forward the balance available is £101,000, as against £58,000 in 1915.

La Société des Câbles Berthoud-Borel reports net profits amounting to £18,200 for 1916, as contrasted with £7,900 in the preceding year, the balance forward raising the sum available for distribution to £26,000. It is proposed to pay a dividend of £1 12s. per share, and to carry £13,000 forward.

The *Société des Tramways de l'Est Parisien* reports that the continuation of the war placed a heavy burden on the results in 1916. Although the traffic showed an improvement over the preceding year, the company was confronted with a considerable increase in the working expenses, owing to the advancing cost of labour and materials, and the profits consequently underwent a marked decline as compared with 1915. The directors had applied to the Prefect of the Seine for compensation in the form of a request to increase fares, but had not obtained any satisfaction. The profits amounted to £32,000, as compared with £48,000 in 1915, and after meeting compulsory charges, taxes, &c., the balance of £17,000 has been transferred to the renewal fund.

The report of the *Ateliers de Constructions Electriques du Nord et de l'Est, of Jeumont-Nord*, reminds the shareholders that as the company's works were situated in enemy occupied districts it was impossible to submit accounts for 1916, as in the previous year. Every effort had been made by the directors to keep themselves informed of the state of their works and installations during the occupation, but communication had become more difficult and uncertain in recent months, and the information obtained from various sources was frequently mostly of limited accuracy. However, there was reason for believing that most of the plant and supplies at the works had been carried off by the enemy, although the company would only know definitely the exact situation when the district had been evacuated. The equipment of the workshops at Saint-Ouen had been increased, and the results hitherto had been satisfactory. The directors were chiefly preoccupied with maintaining their plant which could subsequently be transferred to Jeumont, in order that the latter works might be put in a condition to resume working as soon as possible.

The *Société Parisienne pour l'Industrie des Chemins de Fer et des Tramways Electriques*, which is a promoting and investment company with an ordinary share capital of £2,000,000, reports that the financial results in 1916 were again affected by the consequences of the war, and the situation was substantially the same as in the previous year. A large number of the industrial establishments and tramways established or developed by the company were still occupied by the enemy, and information could only be given concerning the others, which experienced more and more the influence of the excessive rises in the prices of coal and other raw materials. Among these undertakings are mentioned the *Société d'Electricité de Paris*, the *Tramways de Paris*, the *Chemin de Fer Métropolitain*, the *Société d'Electricité pour la Russie*, the *Chemins de Fer Economiques du Nord*, and the *Cairo Electric Railway and Heliopolis Oases Co.* The accounts for 1916 close with a credit balance of £106,000, of which the balance forward represents £87,000. After meeting general expenses the balance of £98,000 has been carried forward to the next account.

The directors of *l'Eclairage Electrique* state that new manufactures were undertaken in 1915-16 at the instance of the Munitions Department, and the company's works, especially at Lyons, had been largely extended. The number of workers exceeded 18,000, of whom 41 per cent., or over 8,000, were women. Extensions were also made at the works in the Rue Lecourbe, where the construction of electrical machinery had been resumed with great activity, whilst at the same time continuing the production of equipment for the various munition works. The Lorraine workshops at Jarville, although partly occupied by the military authorities for the repair of motor lorries, had nevertheless resumed the con-

struction of electric motors. A foundry added to these shops had rendered useful services to the company's other works for the manufacture of machine parts, engine parts, and lathes; a steel plant had also been started, and orders were being executed for dynamo steel and steel for machine guns; and an electric furnace was in process of erection for the production of tool and special steels. Land had been purchased for the extension of the works in the Rue Bolivar in order to increase the output of cables and wire; the production of war material at the Colombes works had been augmented, whilst more active demands were experienced every day for tubes and small appliances, and it had been also necessary to embark on the manufacture of electrical apparatus which were hitherto only made abroad, in order to meet the requirements of customers. The works in the Avenue de Choisy had also been enlarged. The net profits are returned at £150,000, and after transferring £90,000 to the general reserve fund the balance has permitted of the payment of a dividend of 10 per cent. for 1915-16.

The Swiss Brown Boveri Co.—The report of Brown, Boveri & Co., of Baden, states that the pressure of orders continued throughout the financial year 1916-17, notwithstanding the advance in sale prices. On the other hand, the greatest difficulties were experienced in obtaining supplies of raw materials, especially in the second half of the year, when deliveries from Germany considerably decreased. As a consequence, it was impossible to reach the former level of production in peace times from the standpoint of quality, but the turnover financially and the results corresponded to normal years. The activity of the company, it is said, was again restricted solely to the branches worked in peace times. All the foreign manufacturing undertakings associated with the company had yielded satisfactory results. In the case of the electricity supply works a great demand for energy prevailed, and the sales showed a considerable increase. The cost of production in the case of the hydro-electric works remained within the customary limits, but the steam generating stations suffered from the extraordinary rise in the cost of fuel, which could scarcely be equalised by an advance in the charges for current, as these were mostly fixed by contracts of long duration. The conditions created by the war had brought forward in Switzerland the importance of the greater utilisation of water power and of electric railway working. It was recognised specially in regard to the latter that military considerations were not against electrification if it was compared with the danger of the complete dearth of coal in the case of steam railways. Unfortunately, a great obstacle to rapid progress was found in the difficulties in carrying out new installations and the provision of the machinery. In the matter of the conversion of the St. Gothard railway to electric traction, the report mentions that the Ritom power station was in course of construction and trial locomotives were on order; but it could not be foreseen when the latter would be completed. The accounts for 1916-17 indicate gross profits of £332,000, as contrasted with £454,000 in the preceding year. After defraying general expenses, and setting aside £106,000 for depreciation, as against £53,000 in 1915-16, the accounts show net profits and balance forward of £122,000, as compared with £106,000. It is proposed to pay a dividend of 7 per cent. on the ordinary share capital of £1,280,000, this contrasting with 6 per cent., 5 per cent., and 5 per cent. in the three previous years respectively. The share capital is now to be increased to £1,440,000 by the issue of new shares for £160,000.

Spain.—The *Compagnie Generale Madrileña d'Electricité*.—The French committee of holders of bonds in this Madrid company, whose financial troubles were referred to in this journal on February 16th in the present year, announce that the French Government have offered to purchase these bonds at the price of 440 pes. net per bond. Those holders who accept the offer, which the committee consider to be advantageous to the owners, are requested to deliver the bonds to the *Société Générale* or to the *Banque Périer* as soon as possible. The intervention of the Government is due to the circumstance that the purchase and re-sale of the bonds will have a favourable influence on the rate of exchange by procuring capital for French national needs in the Spanish market, and the committee recommend the holders to co-operate with the Government in the matter, they, at the same time, mentioning that it has only been possible to offer the price of 440 pes. per bond by reason of the rise in the peseta in relation to the franc, which increase appears momentary, and will disappear.

Consolidated Electrical Co., Ltd.—The accounts for the year ended March 31st show an available sum after providing for general charges and including £3,159 brought forward, of £6,716. A dividend of 2½ per cent. has been declared, the same as for 1915-16, leaving £3,066 to be carried forward.—*Financial Times*.

Waste Heat & Gas Electrical Generating Stations, Ltd.—Interim dividend of 2½ per cent. for the half-year ended July 31st, less tax.

Willans & Robinson, Ltd.—The "Financial Times" reports that holders of "B" preference stock of Willans and Robinson have received an offer from Dick, Kerr & Co. of 50 6 per cent. cumulative preference shares and 20 ordinary shares in that company, or, alternatively, £65 in cash in exchange for each £100 of "B" preference stock held. The offer will remain open until 30th proximo.

Kensington & Knightsbridge Electric Lighting Co., Ltd.—Interim dividend, 3 per cent. on the ordinary shares for the June half-year.

Calcutta Electric Supply Corporation, Ltd.—The number of units sold to consumers during the five weeks ended June 1st, 1917, amounted to 2,700,256, compared with 2,482,756 units in 1916.

Montreal Tramways Co., Ltd.—Further dividend of 2½ per cent., making 10 per cent. for the year.

Vickers, Ltd.—Interim dividends for the June half-year: 2½ per cent. (less income-tax) on the preferred 5 per cent. stock and 5 per cent. preference shares; 1s. per share (free of income-tax) on the ordinary shares.

STOCKS AND SHARES.

TUESDAY EVENING.

HOLIDAY influences are the main factor in Stock Exchange markets. Evidently a good many people extended the Bank Holiday for a day or more longer; at all events, the attendance in the Stock Exchange is certainly less than it has been of late. The possibility of another new loan, so far from having any adverse effect upon investments stocks, seems to be somewhat inspiring, because the gilt-edged markets are so firm as to reflect strength into other investment departments, and once again the scarcity of floating stock is prominently noticeable.

Marconi shares underwent a sharp reaction when it became known that the Government had commandeered the overseas service of the company. This announcement, with its abrupt 24 hours' notice, coming on the top of a report which was considered disappointing, caused a good deal of selling of the shares, the price of which has fallen 3/16 to 2 15/16. The preference are also ½ down at 2½, and all the recent buoyancy has been wiped out. On the fall, however, cautious bargain-hunters appeared, and moderate purchases were made by those who contend that the Government payment for services since August, 1914, is bound to be a substantial one. The yield on the shares comes to over 5 per cent., and the dividend is still included in the price.

The cable group is as strong as ever. Globe ordinary shares at 12½ are ½ up. Eastern ordinary, Eastern Extensions and Westerns held their recent rises, and it is pointed out that on the quartet just mentioned an average return of 5½ per cent. is obtainable, which is equal to 7½ per cent. on taxed dividends.

Naturally, it does not stand to reason that because companies have paid their dividends tax free in the past, they will continue this practice indefinitely; and the example of several big industrial concerns is quoted as a warning to undue optimism in respect of these cable and manufacturing companies' shares. As we have pointed out in the past, however, there can be little doubt but that they will do their utmost to maintain a long tradition; and as the trend of investment at the moment is set strongly towards the shares of companies which do distribute their dividends tax free, there is not likely to be any diminution in the strength of the stocks of the companies concerned.

India-rubber shares are another 5s. up, but still the yield of 7½ per cent. is certainly tempting, being equivalent to 10 per cent., less tax. The Telegraph Construction return of 6½ per cent. is equal to over 8 per cent., less tax. The same trend has assisted a further recovery in the income bonds of the Underground Electric Railways of London. Whereas the price fell 5 to 79 on the declaration of the dividend, it has now rallied to 81½, this including the 2 per cent. net due in three weeks' time, and so affording a clean return of 5 per cent. on the money.

Metropolitan Railway ordinary hardened to 22½, in sympathy with improvement in Home Railway stocks as a whole—due mainly to the pronounced firmness of gilt-edged issues. Districts remain at 15½.

Interim dividends by the Home Electricity companies are sufficiently satisfactory to have brought fresh buyers into the market. Charing Cross ordinary at 3½ show a rise of 5s. St. James' are ½ up at 6½. It is a little curious to notice that both the ordinary and preference of the Charing Cross Co. yield the same amount. Business is quiet in this department, where buyers, however, are more conspicuous than sellers.

The foreign groups are colourless, and news from Mexico is anxiously awaited. Brazilian Tractions stick at 50. The Argentine Tramways market is a shade firmer, without, however, affecting nominal quotations. No recovery has yet started in British Columbia Electric Railway issues.

General Electric ordinary have improved to 16, and the

preference maintain their rise to 10½. Miscellaneous shares are firm throughout. In the Rubber market, the price of the raw material improved to half-a-crown per lb. without inducing any appreciable increase in business. There is nothing of fresh interest in the markets for base metal descriptions, and the armament group is good, without showing much change.

TRADE IN SOUTH AFRICA.

A summary is given below of certain sections of the recently-issued report* of H.M. Trade Commissioner in South Africa, which will be of interest to the electrical and allied trades:—

It is hardly an exaggeration to say there is no engineering industry in South Africa. The operations of the iron foundries, such as exist, are almost entirely confined to repairs and replacements, mainly in connection with the gold mines; and engineering establishments similarly deal with repairs and erection of imported machinery. There are now two rolling mills, one of which is successfully coping with a seriously felt want in light rails, but even these are at present dependent for raw material on scrap iron and steel, chiefly obtained from the railways. The necessity for having local supplies of pig-iron has become more than ever obvious as the result of the war. It seems, however, unlikely that any steps can be taken at present to utilise the iron ores of the Transvaal. The war has made it even more difficult to obtain machine tools than industrial machinery, so that it has not been possible to make a start, for which such an excellent opportunity presented itself, in engineering work, such as locomotive building.

Apart from mining there is an exceedingly limited demand for machinery. The most noticeable fact is the absence of engineering works. Power is at present very little used by the farmer or pastoralist in South Africa as compared with Australia or New Zealand, and the importation of small gas and oil engines for use on farms is exceedingly small. Another surprising feature is the very limited use of coal gas, either for lighting or heating. This is no doubt due in the Cape Province to the high price of coal, which has to be brought by sea from Natal, or by rail from the Transvaal. Competition has no doubt greatly reduced the cost, but electricity had too long a start to be displaced. Electricity may be said to have matters all its own way in practically every centre. In the direction of meat packing there is promise of great development.

There is little to be said regarding public engineering works. Several water and sewage schemes are pending. In relation to the Cape Town water supply, the expert committee has reported the proposal to add a hydro-electric installation to be impracticable. Any electrical development which may come later, such as electrification of suburban railways, will be in the direction of a new power station.

Supplies of electrical apparatus, &c., previously obtained from Germany, have been furnished by the United States and Japan, into whose laps an unusually large share of the trade of South Africa has fallen during the past two to three years. In respect of machinery, however, South Africa, as is pointed out elsewhere, is a peculiarly small buyer apart from mining requirements. There is no scope of importance for the cheap American gasoline engine, stationary or marine, because so few engines of this kind are required. There is a restricted market for wood-working machinery, and for heavy machinery generally there is no partiality for American makes, so that little business has been given across the Atlantic. Unfortunately, urgent necessity seems likely to cause the purchase of locomotives required by the South African railways from America owing to British makers being engaged on war work. The requirements of the gold mines have been specially arranged for by the Ministry of Munitions, and the transference of orders to the United States has consequently not been large.

As regards industrial machinery, refrigerating plant, woollen or paper mills, cement-making plant and the like, it is essential that manufacturers should realise the elementary facts in relation to countries such as South Africa, which are—apart from mining—only on the threshold of industrialism. Apart from the engineers actually engaged in direct connection with established factories, there are practically none who are specialists in connection with any particular industry. There are, for instance, only two firms manufacturing cement, one woollen mill, two match factories, and no paper mills at all in the country. A glass factory and a coal-tar distilling plant were set up, and subsequently shut down. Even industries such as wood-working, laundries, and others which are carried on in most populous centres are few and on a small scale; and it may fairly be said that no one of these could provide enough business to justify anyone who wished to make a living in specialising. Consequently, manufacturers of plant, if they desire business, must be prepared to provide the expert knowledge themselves. If necessary, they must be ready to send men out to assemble, install, and start up such machinery as they sell. They must, at least, always provide complete working drawings, and full explanations, such as any mechanical engineer without specialist knowledge can understand and work on. Further, it must be borne in mind that inquiries usually come from people who have no engineering knowledge at all, and whose first question is: "How much capital would it require to set up such-and-such an industry?" Some British firms fully understand this, and go to enormous trouble to work out specifications on a basis of a minimum output which could be produced with reasonable economy; but many more obviously do not.

A subsidiary point is the need for British manufacturers

to keep themselves fully posted as to local conditions, such, for instance, as the effect of the high altitudes and low atmospheric pressures on prime movers, both steam and internal-combustion engines, and the areas of South Africa where such altitudes are to be found. The frequency and violence of thunderstorms, the destructive effect of the climate on many kinds of timber, as well as the depredations due to insect life are other points in this category. Many of these important factors are taken for granted by those who live in a country as matters of common knowledge, and they do not always remember to point them out in their inquiries for plant.

Yet another matter to bear in mind is the backward condition of engineering, and consequent difficulty and expense of getting repair work or replacement carried out in many centres. It is, therefore, of vital importance that those lapses which manufacturers are too often inclined to deny should not take place, and that the reliability which they claim for their foremen, their testing and packing staff, and for their system generally, should stand good in all circumstances.

Satisfactory agency arrangements in the case of industrial machinery constitute a very difficult problem. The mining industry is on such a large scale, and is, on the whole, so much centralised, that it has been found possible to organise supply with extreme efficiency and economy. In the case of general industrial machinery, on the other hand, the opposite is the case. Those firms which are qualified to handle such inquiries are to some extent overloaded already, and it is a little doubtful to what extent any of them are in a position to look for business, or still less to create openings. For instance, in connection with the frozen meat industry, much can be done in actually providing the initiative and the suggestion leading to the formation of companies. To study local conditions and economies, and then come forward with a practical working scheme and knowledge as to the capital required, may at least accelerate the formation of such undertakings, and will certainly go a long way to secure goodwill. Manufacturers may further interest themselves financially in such ventures without necessarily taking up the whole financial burden.

There is very ample room for a group or groups of manufacturers of industrial machinery of all kinds, woodworking, machine tools, textile, &c., to have their own representatives on the spot, not only to look for business and deal with inquiries, but to look for possibilities and actually prompt inquiries. To leave this work to busy indent agents, already pre-occupied with local interests of all kinds, seems to the Commissioner unsound. With more initiative, more business can be created, and industrial development can be accelerated. A commission basis in this work also is wrong. Representatives should be good trained men, tactful, and energetic; but it is essential that they should not be deterred from seemingly thankless pioneer work by being dependent for a living on quick results. Nor must they be in the position of having to spend money themselves on travelling long distances to follow up inquiries, with a feeling all the time that it is a gamble whether there will be business to pay for the journey. The representative must be well paid with salary and expenses, and he must be able to have permanent headquarters. In connection with mining, many firms send out their own expert representative, and attach him to the staff of their local agents. This is an excellent arrangement, and a similar plan might be adopted in the case of industrial machinery, except that the representative would probably have to look after the interests of a home group instead of a single firm. For instance, a group might be formed to cover all the industries connected with, and derivative from, frozen meat, makers of abattoir plant, refrigerating machinery and ammonia compressors, disintegrators and fertiliser machinery, and by-product recovery. Fell-mongers' machinery has in the past come chiefly from Germany and America. The making of glue and gelatine, tanning and currying, are similarly allied to the slaughter of cattle, and wool scouring and drying lead easily on to carding and spinning. In this way a very considerable range of machinery could economically and efficiently be not merely represented, but actively pushed. The initiative for forming such groups must come from manufacturers themselves.

REVIEWS.

The Year Book of Wireless Telegraphy and Telephony, 1917. 928 pp. London: Wireless Press, Ltd. Price 3s. 6d. net.

The fifth issue of this well-known year-book has been considerably extended in point of size, and still more so in point of matter contained—both remarkable achievements in these days of printing difficulties, paper restrictions, and price. Nor is there any lack of improvement in quality, but the price of the volume remains the same, and might be called ridiculously low were one not so thankful to obtain anything at once cheap and good in these days! The task of reviewing so compendious a work is best attacked by giving some indication of the scope of its three main sections, viz., the reference section, the technical section, and the special contributions.

The reference section is naturally much the same as in

* Cd. 8,614. Price 3d.

previous years, but has, of course, been brought up-to-date. The "record of development," which is necessarily far from complete since August, 1914, nevertheless contains a number of items for 1916 which bear eloquent witness to the extended use and incalculable possibilities of wireless telegraphy. Amongst the items which have hardly been noticed in the stress of war by others than those directly affected are the part played by wireless during the Irish rebellion (when the English cable was cut); the compulsory licensing for wireless of every British-registered vessel of 3,000 tons or over; and the establishment of commercial radio-service across the Pacific. Partly in order that the latter achievement may be appreciated more fully, the "wireless map" in the year-book is in the form of a duplicated Mercator, showing the Far East as reached by both eastern and western routes.

The reprints (translated where necessary) of the world's wireless laws and regulations have been revised in accordance with the amendments made by certain British dependencies and foreign countries during 1916, and the function which the year-book discharges in thus providing a reliable collection of all national and international regulations and agreements, is of great utility, for it facilitates enormously the establishment of world-wide consistency and the observance of all special requirements.

The list of land and ship stations is unique and invaluable, and is as complete as it can be under present conditions. We would again suggest that the notes on nature of service would be more convenient if arranged at the foot of each page instead of being at the end of the list. We trust that it will soon be possible to record in this list a large number of stations open for public wireless telephone service. Whilst mentioning wireless telephony, we would again urge that a reasonable proportion of the year-book be devoted to this important subject. Possibly the fault is ours, but so far we fail to find any other mention of wireless telephony than in the title of the year-book and in a few items in the record of developments. In view of the achievements of 1915 it is hardly conceivable that there is nothing which might usefully be said concerning wireless telephony in 1916. Probably the truth of the matter is that it would be too *useful*—to the enemy!

The standard features of the technical section have again been revised and brought up-to-date. In addition to the chapter on international time and weather signals, there are many pages devoted to useful data, and to a very valuable collection of useful formulae and equations which has been revised by Dr. Erskine Murray. The same authority has also compiled a glossary of terms used in wireless work, combining the glossary issued in previous editions with definitions derived from other European sources, and with the definitions evolved by the American Institute of Radio Engineers. The result is a table which it is hoped "will find acceptance on both sides of the Atlantic." Our old friend, the five-language dictionary of wireless terms, again appears, and very welcome it is; but why have not the Russian equivalents of the words been added? Surely, the time is ripe for that addition. The catalogue of wireless telegraph patents has been brought up to date, and other similar lists which are so invaluable for reference purposes are the bibliography of books and periodicals in all languages dealing with wireless matters, and the directories of wireless societies and of companies engaged in the commercial development of wireless. The ever-extending collection of portraits and biographical notices forms in itself a sufficient testimony to the status and world-wide development of wireless telegraphy.

Turning now to the special contributions, these include some articles of technical interest and some of general interest, and are alone worth the price asked for the whole volume. A summary is presented of Judge Mayer's decision in the Fleming Valve-De Forest Audion action, which decision constitutes an education in itself on the subject of detectors, and is regarded as one of the finest technical decisions ever promulgated. Dr. Fleming writes with characteristic thoroughness on the electric arc as a generator of persistent oscillations; Dr. Eccles contributes a fine monograph on the peculiar action and immense possibilities of ionic valves; Prof. Howe writes on the inductance, capacity, and natural frequency of aerials; and Dr. Marchant deals with what is commonly known as the "Heaviside layer"—that hypothetical, but probably existing, ionised layer of the upper atmosphere which offers so much in the way of explaining why signals can be sent across the Atlantic from and to aerials only a few hundred feet high, round or over a wall of water and earth nearly 100 miles high. Mr. C. H. Taylor's experience in the construction and working of American long-distance stations enables him to write with authority on this subject, and, whilst his article will be found instructive by the specialist, even those readers with little technical knowledge will also be able to profit from his lucid exposition.

Of Imperial interest are the tales of "wireless heroism," recounting the deeds of operators who were singled out for official recognition last year. "The Wireless Drama," by A. Noyes, describes one "incident" in which a U-boat was thwarted by wireless; the achievements of wireless telegraphy are surveyed by P. W. Harris; and a list is given of vessels which have figured in disasters where loss of life has been prevented or mitigated by "wireless to the rescue." In concluding these remarks, which do less than justice to a most

fascinating and valuable volume, we may mention that the map showing the wireless stations of the world has been improved, not only by enlargements, but also by printing in red those stations which are open for ship and shore communication.

Primary Batteries: Their Theory, Construction, and Use. New and enlarged edition. By W. R. COOPER, M.A., B.Sc. London: The Electrician Printing & Publishing Co., Ltd. Price 12s. 6d. net.

Since 1901, when the first edition was published, Mr. Cooper's "Primary Batteries" has deservedly been regarded as the standard book on this subject. While in the intervening 16 years no radical developments have taken place either in the theory or in the main types of primary batteries, considerable improvements in details of construction have come about, and for the book to maintain its position, at least on the descriptive side, it was essential to bring it up to date. This Mr. Cooper has done with the same care and discrimination as were displayed in the original compilation.

In the first five chapters, which cover the theory of the subject, few changes or additions are to be noted. True, the electron theory has become of outstanding importance since the date of the first edition, but, as the author remarks, while it gives us a simple way of looking at some of the phenomena, it does not add directly to our knowledge of primary cells—except in the rather special case of selenium cells.

Among the newer types of one-fluid cells described (Chapter VIII) is the interesting Benkö bichromate cell, in which polarisation is eliminated by forcing the electrolyte or allowing it to diffuse through the carbon negative plate. Descriptions of improved forms of the Edison-Lalande cell, the Columbia Track, largely used in America, and the Neotherm cell, and an account of Bellini's interesting cell in which the positive plate is amalgamated lead and the electrolyte a mixture of sulphuric and nitric acids, have also been added to this chapter. A further important addition is a section on the effect of the physical quality of manganese peroxide on its depolarising power, and the Post Office specification for Leclanché cells is also a new and useful feature of this chapter. New matter in the following chapter, dealing with two-fluid cells, includes an account of the Bleek-Love, an Australian cell with zinc/lead-peroxide elements, the E.M.F. of which, 2.5 volts, is higher than that of any other primary cell.

Dry cells (Chapter X) are of particular importance at the present day, when enormous numbers are being manufactured daily for use in pocket flashlamps. It is a curious omission that the small cells used for this purpose are not specifically dealt with. Although they are, to be sure, merely miniature forms of the standard types of dry cells, they certainly present problems of their own which might have been discussed. Otherwise, this chapter is most informing, particularly on the question of tests, which is discussed somewhat fully. Included here are an account of the methods of testing standardised by the American Electrochemical Society, and the specifications on the same subject issued by the British Post Office. The chapter on standard cells (Chapter XI) has also been much enlarged and revised, the chief novel features being a full account of the latest practice in the preparation of the materials, and the assembling of Clark and Weston cells based on the methods employed at the National Physical Laboratory and the Bureau of Standards at Washington. The information in this chapter, as throughout the book, is brought home to the reader and rendered exact by constant reference to quantitative tests, and the book abounds in illustrative curves.

An entirely new chapter discusses the properties, theory, and uses of selenium cells, and very useful it is to have collected together the considerable amount of scattered information on this subject that is now available.

The last chapter, dealing with carbon-consuming cells, differs little from that in the first edition—a sad tribute to the disappointed hopes of many an ingenious inventor. The direct production of electricity from coal remains a dream of the future.

CANADIAN ELECTRIC COOKING NOTES.

THE recent business convention of the Canadian Electrical Association, at Montreal, dealt briefly, in one of its reports, with the question of electric cooking and heating, and its future development. This branch of supply business has been, to a large extent, "side tracked" in Canada, as in this country, by more pressing matters, but it is considered that it is now on a sound basis, and that electric cooking will be universally adopted within a very few years.

It is agreed that the range load will come in part on the peak of the average station, but that this will be more than offset by its demands at other times, particularly in the morning.

The maximum demand of a group of 20 ranges or more rarely exceeds 15 per cent. of the installed capacity, and this diversity reduces the additional investment of the station on account of the load, and ought to provide an incentive to supply authorities to

refrain from half-hearted methods of tackling the cooking problem.

The report to which we refer goes on to consider water heating, remarking that "one can scarcely be considered without the other, for very often the installation of an electric range means the removal of the old method of heating water for domestic purposes. While the load characteristics appear to oppose each other, they have a complementary effect in balancing the load curve. The peak of hot water heating often comes on as late as 10 p.m., where heaters are used to a large extent for dish washing and bathing.

"One of the principal member companies in Canada is engaged at the present time in working out a plan to sell, on a term basis, electric ranges connected up ready to operate. The same company already has in effect a water-heating proposition, under which they furnish, install, and connect water heaters for a definite sum. These heaters are arranged to be connected for 500 watts under a flat rate, and 2,000 watts through the meter. Current for the high heat is sold at the residence rate, the heater consumption usually being billed entirely on the third step of the rate, which is low.

"It is recommended that, so far as possible, water heaters installed in connection with ranges be placed on a double-throw switch, so that the water heater is not in circuit while the range is in use."

The water-heating problem has not yet met with a satisfactory solution in this country, one reason, no doubt, being that the coal range and boiler are fixtures, and are not removed from the premises when the electric range is installed, while another and more material reason is the lack of serious effort by supply engineers and electrical manufacturers to meet the competition of rival methods.

The following brief statements on the development of business represent the views of Canadian central station men in touch with the demands of the situation:—

"Central stations must plan to take care of as much business as gas companies have in ranges."

"Efficient salesmen specialising in the business of ranges must be employed."

"Educate the customer in efficient operation."

"A national publicity campaign on the ease, safety, cheapness, and other advantages which the electric range alone possesses."

"Central stations must sell service rather than KW.-hours and cooking rather than ranges."

"The fullest co-operation must obtain between the manufacturers, contractors, and central stations."

Attention is drawn to the cost of connecting ranges, which should be reduced.

Many companies are not prepared, so far as their circuits are concerned, to take on a cooking load without some additional expense, and it has been found that the costs for individual service range from \$75 to \$100, a figure which will decrease with numbers.

The Association is recommended to carefully investigate the question of keeping down distribution cost and providing satisfactory regulation.

In reference to range construction, it is pointed out that manufacturers are guaranteeing a life of 4,500-5,000 hours for heating units, which can readily be renewed.

The following features are regarded as essential:—

Indicating device to show whether current is "on" or "off."

Standard elements, quickly and cheaply interchangeable.

Oven construction such that it can be thoroughly and easily cleaned; a reliable thermometer.

Terminal contacts placed so as to give the minimum of trouble; separate fuses for each heater; and rigid frame construction.

In an address at the same Convention, Mr. Julian C. Smith referred to the time, five or ten years hence, when the average demand of the domestic consumer will reach 300 KW.-hours per capita, instead of 100 KW.-hours, which is considered the present average.

It is the fact that we have not sufficiently probed the electrical possibilities of the domestic consumer, and until we do so, it is impossible to estimate the probable effect of the domestic load on the station or even to frame a tariff which will result in the desired development.

A GRANULAR CARBON ELECTRIC FURNACE.*

By SAMUEL A. TUCKER,

A VERY useful furnace for maintaining temperatures considerably above those possible with the usual wire-wound furnace has been constructed in our laboratories (Columbia University).

The design here shown in figs. 1 and 2 is simple to construct, the parts are inexpensive, it will reach a high temperature in a short time, energy consumption is not great, and the heated space is perhaps larger than is usually found in such furnaces. One difficulty in using a circular granular carbon resistor is in the tendency to uneven heating, particularly at the start. This furnace is, therefore, provided with four electrodes, as shown in the sketch.

The furnace body, 12 in. × 12 in. × 9 in., is of fireclay, with an opening as shown. This particular shape was used because it happened to be in the laboratory; however, such a body could have been taken from one of the usual gas crucible furnace parts which are to be obtained on the market. Four holes are bored to admit the electrodes about 1 in. diameter to the open space B; this space is partitioned by the carborundum ring C, which is 1 in. outside diameter $3\frac{1}{8}$ in. inside and $3\frac{1}{4}$ in. high. This gives an annular space for the granular carbon connecting all four electrodes.

Granular carbon was obtained from the National Carbon Co., the size of grain being about 20 mesh, and was filled in to the top of the refractory ring.

The ring itself was constructed as follows (fig. 3):—Carborundum ground fine in a ball mill was mixed with 25 per cent. fireclay and

FIG. 1.—HORIZONTAL SECTION OF FURNACE.

enough water added to make a thick mass. This mix was then tamped into the cardboard mould shown in the drawing. The inner form at 1 and 2 is made by wrapping the cardboard on wood form 2, and holding it on the wood with small tacks or glue.

The outer form at 3 is also of cardboard held on the wood base projecting up inside the cardboard cylinder, as shown by the dotted line, and strengthened by the wood block at the top. In this way the form can be made quite strong enough, and, at the same time, is sufficiently porous to permit of the drying-out of the mixture. After thoroughly drying in a gas oven at 110° C., it is transferred to a gas muffle and thoroughly baked at a temperature of 900° to 1,000° C. The mould is, of course, lost, but it is so easily made that it is of little consequence. The ring so constructed is quite strong enough for the purpose intended, and the furnace cover, &c., may be made in the same way. Electrical connections are made as shown in the diagram from the five switches with wire of about 50-ampere carrying capacity. On closing switches 9, 3, 6, and 12 we have adjacent electrodes of opposite polarity, and a short time

FIG. 2.—VERTICAL SECTION OF ELECTRIC FURNACE.

FIG. 3.—CONSTRUCTION OF RING.

will suffice to show whether the ring is heating evenly. Should this not be the case, and one quadrant appears to be too hot, this can be cut out by opening the switches for that position. When all have become evenly heated, 9, 6, and 12 are opened and 3 and 9A closed, by which arrangement it acts as a two-pole furnace, which is the normal manner of running.

The following figures give a run with such a furnace using direct-current at 120 volts through variable rheostats R:—

Time.	Amperes.	Volts.	Temp. deg. C.	Remarks.
9.30	25	—	—	4-pole
9.40	40	—	500	Changed poles to regulate
9.50	38	—	700	
10.00	12	—	720	2-pole
10.10	36	—	900	2-pole
10.20	18	98	1,000	2-pole
10.40	23	98	1,200	2-pole
11.00	24	98	1,300	2-pole
12.00	22	97	1,300	2-pole

The furnace was covered with a carborundum disk and further with asbestos board, with a small opening to allow the introduction of the thermocouple. In another case the furnace reached 1,400° C. in 45 minutes, using 50–60 amperes at from 51 to 53 volts.

* Metallurgical and Chemical Engineering.

It is necessary to have the electrodes fitted well to the openings provided in the body, and this can be done by wrapping with thin asbestos paper and luting with asbestos fireclay cement from the outside. Iron bands are necessary to clamp the body to prevent cracking.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

EXPORT PROHIBITIONS IN CERTAIN ALLIED AND NEUTRAL COUNTRIES.—The *Board of Trade Journal* has issued as a Supplement (in two parts) complete lists of the articles which are prohibited to be exported from the United Kingdom, Denmark, France, and Algeria, Italy, Japan, Netherlands, Norway, Portugal, Russia, Spain, and Sweden. Copies of the Supplement may be obtained, price 3d. each part (post free 3½d.), from H.M. Stationery Office, Imperial House, Kingsway, W.C. 2.

FRANCE.—The French Customs Department have recently issued a number of decisions regarding the classification of certain articles under the French Customs Tariff, among which the following are noted:—

Apparatus and machines for dissolving or softening rubber and gutta-percha—to be classed as apparatus not specially mentioned (number 525 *ser*).

India-rubber, not worked, mixed with indirect derivatives of coal tar—to be subject to duty, *on the whole weight*, as chemical products derived from products of the distillation of coal (number 280).

Asbestos substitute (admixture of mineral materials, cellulose fibres, and asbestos fibres)—to be classed as cellulose pulp, mechanical, dry (number 168).

PORTUGAL.—Some further restrictions on the exportation of certain goods from Portugal have been decreed since the issue of the Board of Trade Supplement above referred to. The new restrictions include asbestos in any form, and manufactures thereof; rubber wares, balata, gutta-percha, and other similar products in any form; chromium, manganese, molybdenum, mercury, nickel, titanium, vanadium, precious metals, and alloys thereof, in any condition; emery, corundum, natural and artificial (alundum), carborundum, and any other substance for similar use; ferro-silicon; graphite; electrical material suitable for use in war, and accessories and separate parts thereof. Exportation of any of these goods may only be effected under authority issued by the Ministry of Finance, and subject to the payment of any existing surtax on the goods.

UNITED STATES OF AMERICA.—According to a Treasury Department Circular recently issued, mail packages found upon examination to contain samples having a dutiable value of less than one dollar will be admitted free of duty, and no mail entry will be required. [This modifies the announcement in the *Review* of June 29th.]

ST. VINCENT.—A new schedule of import duties has been brought into operation by Order-in-Council, and took effect on April 1st last. An all-round increase in the rates of duty has been made, with the expressed purpose of increasing the revenue of the Colony. Hitherto the majority of goods imported have paid a general *ad valorem* rate of 10 per cent, for British goods and 12½ per cent, for foreign. The new rates are 13½ per cent, and 17½ per cent, respectively. The specific rates of duty, which are comparatively few in number, have been increased in the same proportion. Electrical machinery not on the free list accordingly will pay 13½ per cent, *ad val.* under the British Preferential Tariff, and 17½ per cent, *ad val.* under the General Tariff. [NOTE.—The free list includes telegraphic, telephonic, and electrical apparatus and appliances of all kinds for communication or illumination; also certain other classes of electrical machinery and appliances when not imported for sale.]

NEW PATENTS APPLIED FOR, 1917.

United States Training Camp Equipment.—The electrical requirements of the 16 great camps that are being established for the training of the new U.S. Army are outlined in the *Electrical World*. The principal items include 20,800,000 ft. (6,339,853 m.) of insulated wire, 260,000 ft. (79,248 m.) of lamp cord, 125,000 key sockets and shades, 150,000 cleat receptacles, 3,175,000 pairs of porcelain cleats, 1½ million porcelain tubes, seven million screws, 4,800 lb. (2,177 kg.) of solder, and other materials in proportion.

After the war, perhaps, we shall be able to give some particulars of the electrical work done in our own camps, which must have been on a colossal scale.

ELECTRICAL INTERCONNECTION IN LANCASHIRE AND CHESHIRE.

THE second report of the Committee for the Interconnection of the Lancashire and Cheshire Electricity Supply Systems, which we reproduce elsewhere in this issue, will be studied with great interest by electricity suppliers throughout the country. The Committee presented an interim report in September, 1916, which formed the basis of the Manchester Conference in March last: one result of this was a semi-official invitation to the Committee to work out the essential details of a scheme, which are embodied in the report just issued. The important feature of this report, to our mind, is that it presents concrete proposals to the electricity suppliers of the country—instead of the intangible nebosity which has so far enshrouded official deliberations on the matter.

It would be premature to suggest that the recommendations set forth—though they are made by authorities whose intimate knowledge of the inner working of both municipal and private electricity supply undertakings is beyond question—will result in unalloyed harmony amongst the many authorities with conflicting interests in the area concerned. To achieve such a result at all is an impossibility in an average community: but despite the difficulties which one may discern lurking in the background, there is sufficient in the second report of the Committee to form a working basis for a practical scheme of electricity supply on a scale which accords with modern ideas—one which provides for the evolution of electricity supply along well-recognised lines, with the least possible disturbance to financial and local interests.

The report, which should be studied in detail, is in two sections, the first portion dealing with the constitution and powers of a proposed Joint Board, representative of both local authority and company interests, and its powers—which practically amount to the general control of the operation of the generating stations in the area, the formulation of tariffs for bulk, stand-by, and reciprocal supplies, the allocation of financial charges incurred in giving such supplies, and the making of the necessary agreements between the various authorities. The Board would also act in an advisory capacity, and to facilitate its work it would be divided into four District Boards representing groups of undertakings, and these would elect a central executive, both the boards and the executive having various powers delegated to them. It is not proposed to invest the Board with any powers to raise capital, the present arrangement being regarded as sufficient "under existing conditions" and in view of the proposed allocation of expenditure between participating authorities.

Amongst other matters which we can only briefly mention are compulsory powers for wayleaves, and public road crossings: also powers to reimburse authorities who may

be adversely affected financially through co-ordination. The Committee records its opinion that *no direct profits* should be made on the class of supply dealt with in the report, except under special (and quite obvious) conditions; it further advocates the exemption from local taxation of interconnecting mains and plant, except where used for distribution purposes.

This section of the report deals with matters arising from the interconnection of supply undertakings, but the Committee recognises that this is but a first step, and that at the present rate of increase in the maximum load of the area dealt with, *i.e.*, 32,000 kW. per annum, the question of generating capacity must be considered, although not strictly within the terms of its reference. It therefore recommends in a supplementary section of the report that the Joint Board should have powers to erect new power stations and to acquire existing ones, considering it advantageous that the financial and controlling powers in the area should be centred under one owning and operating authority. In the case of companies it is suggested that this would probably involve purchase of their entire undertakings, though it should be noted that the Committee feels that the rights of statutory undertakings should be maintained as regards the distribution and sale of energy.

The Committee voices its agreement with the recommendation tendered to the Board of Trade Electrical Trades Committee advocating the appointment of a new tribunal consisting of a limited number of Electricity Commissioners, but suggests that the latter should be the central authority on technical matters, besides possessing all other powers now exercised by Government departments, or which may be conferred on them. The portion of the report dealing with the acquisition, &c., of generating stations has not been subscribed to by the three company representatives on the Committee, for obvious reasons; one municipal representative also disagrees with the further powers proposed for the Joint Board.

We have necessarily dealt somewhat cursorily with the report, which demands more leisure than we possess at the moment. To us it represents, on the whole, a carefully studied working scheme, drawn up with a view to furthering the national interests in cheap electricity supply, in the best of all possible ways, *i.e.*, by the mutual co-operation of existing supply authorities under expert guidance.

The L.C.C. Tramways.

THE question why the London electric tramway system, providing transportation for a population numbering some $4\frac{1}{2}$ millions, is barely able financially to keep its head above water, whilst the tramways of other great cities with less than a quarter of that population, such as Glasgow, Manchester, and Liverpool, not only cover all their expenses, including large allocations to the redemption of debt and the building-up of large reserves, but also contribute very substantial sums to the reduction of the rates, presents a serious problem for the consideration of the residents in the County Council's area of administration. It is a matter of considerable complexity, and no single cause can be assigned for the disappointing results that are annually made public. It must be admitted that the conditions obtaining in the Metropolis present wide divergences from those existing in any other British city, and consequently it is hardly possible to institute comparisons on an equitable basis; but even if the case of London be considered without regard to what can be done elsewhere, it is difficult to believe that the results so far achieved are the best attainable.

Perhaps the greatest misfortune that the system has suffered has been the fact that from the beginning it was the victim of political manœuvring and the sport of rival parties, not only in the Council, but also in the State. By the adoption of the underground conduit system, the consequences of which policy were foretold in our pages, the undertaking was saddled with a tremendous financial burden from the start; as Mr. A. J. Lawson reminds us elsewhere in this issue, the Glasgow tramway system cost less than half as much per mile as the London tramways, although in later years the trolley system has been adopted for a large proportion of the latter. This

initial error can never be wholly retrieved. The tramways also were debited with heavy charges for road widening and other improvements, the benefits of which, however, have enured very largely to other interests. Again, though this circumstance is not restricted to London, the cost of maintaining the paving between and alongside of the tracks is a heavy item, which in fairness ought not to fall upon the tramways alone—particularly in view of the competition set up by motor-buses, which wear out the roadway more rapidly than any other agency, and yet contribute practically nothing to the cost of their maintenance. Another excessively costly burden is the provision of transportation at rates far below cost price, known as "workman's fares," but in actual fact at the service of all persons travelling between certain hours of the morning. These fares were granted in pre-war days, and were undoubtedly reduced to their present absurdly low level for political purposes; whether the desired end was achieved or not we do not know, but it is certain that the loss on this class of fares is in reality simply a subsidy paid to the London employers, who would otherwise have had to pay higher wages to their workpeople.

Even at that, it is grossly unfair, as Mr. Lawson points out, for only those employes who go to work early in the morning can travel at the cheap rates. The absurdity of the position is well brought out if one contrasts it with the well-known "restricted-hour" tariff in electricity supply. In the former case, the charges are reduced to a nominal value during the morning peak load, and are maintained at a far higher value during the slack hours; in the latter case, those who use the supply during the peak-load hours quite properly have to pay correspondingly higher rates, and it is the users in the slack hours who are encouraged with cheap rates. Surely the present management of the L.C.C. tramways—on the commercial side—is the very antithesis of scientific method; it is also unjust, and, worst of all, unsuccessful. The system is also burdened with excessive capital outlay, and oppressed by unfair competition; the former cannot be remedied, but at least the L.C.C. should secure some control over the competing omnibuses, such as is already vested in provincial municipalities.

It may be argued that the tramways are not intended to make profits, or even to pay their way—that their purpose is to carry the people at the lowest possible rates, the resulting benefits to the county more than outweighing the cost of meeting the deficit. This is quite a comprehensible, if somewhat Socialistic, point of view, and there is much to be said in its favour—but if this be the intention of the Council, it ought to be openly avowed, and avowed beforehand. It is easy, when one has made a loss, to say one never meant to make a profit, but it is not convincing; and we do not recollect any occasion on which such a policy was advocated by the Council.

Now, if ever, is the time to reform the faulty system of assessing fares, when employment is universal and well paid; we do not suggest that extra charges should be made during peak-load hours, but at least the absurd anomalies of the existing system should be removed, and the undertaking placed upon a sound financial basis. We believe that it can be done by relieving the tramways of unfair charges, subjecting competitive users of the roads to a fair measure of taxation, and taking steps to ensure that no passenger shall ever be carried below cost price.

At the same time improvements should be made in the service by equalising the intervals between cars, and instructing the drivers and conductors to look out for intending passengers. It is the rule, rather than the exception, on some routes to see three or four cars pass in a bunch, an interval of five minutes or more elapsing before the next bunch comes along, during which period the omnibuses have things all their own way. Cars cannot be prevented from bunching when approaching busy junctions and crossings, or in dense traffic, but when the road is clear a driver should not be permitted to approach within, say, 300 yards of the preceding car. As for keeping a look-out and trying to pick up all the traffic that can be handled—apparently this is not regarded as good form. At any rate, it is not done. In this respect the L.C.C. staff have much to learn from the motor-bus conductors.

HALIFAX CORPORATION ELECTRICITY WORKS.

To cope with the rapidly increasing demand for electrical energy in the Halifax area, the Corporation recently installed a new turbo-generator set of 6,000 kW., a description of which is given below.

Originally the system was three-wire D.C., but six years ago it was decided to adopt for power supply a three-phase system at 50 cycles, 6,600 volts, and to install a 1,500-kw.

FIG. 1.—B.T.H. 6,000-KW. TURBO-ALTERNATOR AT HALIFAX.

turbo-generator, the British-Thomson Houston Co. being given the contract for this, together with the necessary switchgear, while the Worthington Pump Co. received the contract for the surface condensing plant. At the same time, it was decided to install two 750-kw. rotary converters in order to convert the alternating current to direct current for supplying the ordinary D.C. network for lighting and power purposes, and the overhead lines for traction. The contracts for these rotary converters were also given to the British Thomson-Houston Co. The demand increased very rapidly, and a further turbo-generator with a capacity of 3,500 kW., together with surface condensing plant, was installed at the end of the year 1913, this plant being also divided between the British Thomson-Houston Co. and the Worthington Pump Co., while another 1,000-kw. rotary converter, made by the British Thomson-Houston Co., was installed just as the war commenced in 1914. Owing to the rapid increase in demand for power purposes due to the war, this plant soon became loaded up, and it was therefore decided to install the 6,000-kw. turbo-generator referred to above. This plant was officially started up by Lady Rhondda on July 19th, 1917.

In the meantime the demand has been such that the existing 1,500-kw. and 3,500-kw. turbo-generators have been running practically on full load for over 18 months without any spare, and it speaks well for the reliability of turbo-plant that only one small breakdown occurred during the whole of that time, this being due to a very slight mishap on the governor gear of the small auxiliary turbine driving the condensing plant of the 3,500-kw. set; a repair was effected within three hours of the mishap occurring.

During the time when the above extensions were being made to the generating plant, substantial additions were made to the steam-raising plant in the shape of four Babcock & Wilcox water-tube boilers, two of which were capable of generating 21,000 lb. of steam per hour, one

30,000 lb. per hour, and the remaining boiler 27,000 lb. per hour. The first two are fitted with chain-grate stokers of Messrs. Babcock & Wilcox's make, while the others are fitted with the underfeed type of stoker, as made by the Underfeed Stoker Co., the forced draught for these being provided by fans made by Messrs. Musgrave & Co., of Belfast. At the present time the boiler-house plant is barely sufficient to cope with the demand, but another water-tube boiler, to evaporate 30,000 lb. of steam per hour, is being supplied by Messrs. Babcock & Wilcox, together with Green economisers and an induced-draught fan by Messrs. Musgrave & Co. This plant should have been ready for delivery before the winter load comes on, but it is doubtful whether the delivery date promised will be kept, owing to the difficulty in obtaining steel plates.

The recent progress of the undertaking may be gauged by the fact that whereas the annual output (sold) up to the end of March, 1911, had not exceeded 6 million units, in 1913 it was 7½ millions, in 1915 11 millions, and in 1916-17 16,703,101 units; the maximum demand rose during the period referred to from 2,960 kW. to 6,784 kW. in 1916-17. Since 1899 the revenue account has shown a surplus every year, and the history of the undertaking has been a record of continual upward progress.

By the courtesy of the borough electrical engineer, Mr. W. M. Rogerson, M.I.E.E., who has been responsible for the design and supervision of the whole of the extensions, we are enabled to reproduce photographs of the new plant. The turbine is of the well-known Curtis horizontal impulse type as manufactured by the British Thomson-Houston Co., Ltd., of Rugby, being similar to the 3,500-kw. set which was installed some three and a-half years ago, except that it is of the 11-stage type, running at a speed of 1,500 R.P.M., with a steam pressure of 150 lb. per sq. in. and superheat of 500° F.

FIG. 2.—B.T.H. TURBO-ALTERNATOR, STEAM END.

The alternator is of the revolving-field type, connected direct by a flexible coupling to the shaft of the turbine. The machine is designed so as to require no external ventilating fans; air is drawn through a special air duct at the bottom of the machine, passing through filters before entering the air duct, and is expelled into the engine room through an opening in the top of the machine.

The exciter is driven direct by means of a flexible coupling from the alternator shaft.

The normal full load of the set is 6,000 kW. at 100 per cent. power factor and 7,500 K.V.A. at 80 per cent. power

factor, and the alternator is capable of 25 per cent. overload output for a period of two hours at 80 per cent. power factor. The voltage is controlled by a Tirrill regulator fixed on the switchboard. The guaranteed steam consump-

FIG. 3.—WITTON ROTARY CONVERTERS AND SWITCHBOARDS AT HIPPERHOLME SUB-STATION.

tion per kW.-hour at 100 per cent. power factor and with a 28-in. vacuum is as follows:— $1\frac{1}{2}$ full load, 14.0 lb. per kW.-hour; full load, 14.1 lb. per kW.-hour; $\frac{3}{4}$ full load, 14.4 lb. per kW.-hour; $\frac{1}{2}$ full load, 15.3 lb. per kW.-hour. The above figures are guaranteed with a $2\frac{1}{2}$ per cent. margin.

The condensing plant was supplied by the Worthington Pump Co., Ltd., and consists of a circular surface condenser with a cooling surface of 16,500 sq. ft. The circulating pump is of the 16-in. twin high-speed type dealing with 12,500 gallons of water per minute against a total head of 42 ft., lifting the water to the top of the existing cooling towers.

The air pump is of a somewhat novel type, consisting of a 10-in. rotary air pump and an 8-in. low-lift operating pump. These pumps take water from a tank and discharge it through a regulating valve into the nozzle of an

of approximately rectangular cross section, leaving sufficient space between each other for the entry of air and vapours removed from the condenser; at the same time, the wheel imparts to the jets a rapidly revolving motion, as a result of which the water jets rush through the ejector cone and diffuser in the form of a helix with a pitch and velocity diminishing as the compression of air and vapours proceeds.

The air and vapours from the condenser entering round the rotary transforming wheel are caught and enclosed by the issuing water jets, and compressed on the way down to the diffuser discharge. The water discharged by the ejector into the tank gives up the air entrained, and is circulated over again by the centrifugal pump, and in order to prevent an undesirable rise in temperature in the operating water by the process, cold water is constantly supplied to the tank. The results of this apparatus have been highly satisfactory: it is extremely simple, and can run practically without attention. The vacuum obtained is excellent, and the power required moderate. It has the advantage that if air leaks open up in the system, causing the vacuum to drop, it will accommodate itself to such condition, and maintain the best possible vacuum, and if the cause of the leak is removed, will pull the vacuum to the original height.

If the transforming wheel stopped or was taken out altogether the efficiency and vacuum would be reduced, but the machine would continue its work just the same.

For extracting the condensed steam from the condenser

FIG. 5.—HEBDEN BRIDGE SUB-STATION.

and delivering it into the hot well on the engine-room floor level, a 5-in. two-stage centrifugal hot-well pump is provided.

All the above pumps are arranged on one convenient bed-plate, and are driven by a horizontal single-stage Curtis turbine, rated at 275 B.H.P., the exhaust steam from which is taken direct to the condenser.

The cost of the whole plant, including foundations, piping, &c., has been approximately £23,000.

It is interesting to note that the above set has displaced a 300-kw. Pollit engine and alternator and two 200-kw. Parsons D.C. turbo-generators, which plant was installed some 18 years ago.

In order to afford a supply of continuous current to the outlying areas of Hebden Bridge and Hipperholme, the Halifax Corporation has recently constructed two converting stations in these districts. For the electrical equipments of these sub-stations the contract was entrusted to the General Electric Co., Ltd., of London. The converting unit chosen was the 250-kw. Witton rotary converter, together with an oil-insulated air-cooled transformer, taking in three-phase power at 6,600 volts, and generating at 550 volts for traction and 220.0-220 volts for lighting, the rotary converters serving the double purpose.

The incoming feeders are controlled in each sub-station by Witton mistake-proof switchboards. The Hipper-

FIG. 4.—WITTON MISTAKE-PROOF IRONCLAD SWITCHBOARD AT HIPPERHOLME.

ejector. When leaving the nozzle the water passes through a wheel, by which the jet is divided up into a number of jets

holme sub-station, having two converting units, has two incoming feeder panels on the high-tension board, and two machine panels; that at Hebden Bridge has but one machine panel. These installations are carried out on the Witton boiler-plate cubicle system for sub-stations. The cubicles eliminate the possibility of accident to the operator through inadvertence, a thorough interlocking arrangement preventing such occurrences.

The rotary converters run at a speed of 1,000 R.P.M., and are designed for reactance control. For the purpose of keeping constant the voltage across the three-wire network, the neutral wire is taken from the star-point of the transformers. The converters are of the self-synchronising pattern, being run up to speed by a starting motor and switched in through choking coils. They fall into step easily without any synchronising and without any reversal of polarity.

The Witton low-tension boards include both traction and lighting panels, and a simple arrangement of interlocks between the liquid starter for the motor, the circuit breaker, and the short-circuiting switch for the liquid starter, precludes any possibility of error in the sequence of the operations. Change-over switches are also included on the board for applying the machines either to lighting or traction, and these switches make provision for the opening of the neutral connection when the machines are required for the latter purpose.

We are indebted to Mr. W. M. Rogerson, borough electrical engineer of Halifax, for assistance in preparing this description.

LONDON COUNTY COUNCIL TRAMWAY RESULTS IN 1916-17.

By A. J. LAWSON, M.Inst.C.E.

THE accounts for the past year's working of the tramways of the London County Council were presented in final adjusted form at the Council meeting held on July 17th, and the following tabulated synopsis and analysis gives the chief items of information:—

Total receipts for year	£2,552,204
Receipts from passenger fares	£2,476,309
Operating expenses	£1,817,694
Interest on borrowed money	£314,165
Redemption of debt	£429,851
Total expenses	£2,561,710
or £9,506 more than the total receipts.	
Route miles operated	141'67
Revenue per route-mile	£17,479
Car-miles run	49,478,973
Passengers carried	586,127,976
Passengers per car-mile	11'846
Average fare per passenger	1'014d.
Operating expenses per passenger	7'44d.
Total expenses per passenger	1'049d.
(including interest on and repayment of debt)	
Operating expenses per car-mile	8'817d.
Total expenses per car-mile	12'424d.
Total receipts per car-mile	12'420d.
Receipts per car-mile from passengers' fares	12'011d.

Actually, therefore, the total revenue properly appertaining to the working of the tramways was £9,506 short of the total revenue required to meet all expenses, but owing chiefly to interest received on cash balances, and interest or rent from surplus properties, there is shown a credit balance or surplus of £11,342 10s. 3d., which is carried to the renewals fund account, being the first addition thereto since 1912-13—and more in name than in reality, since no account is taken of the depreciation in investments which that fund represents, nor of the depreciation of investments in which the general reserve fund is supposed to be placed.

The nominal value of these at March 31st last was:—

Renewals fund	£282,978
General reserve fund	72,391

The total debt incurred up to March 31st, 1917, was

£13,930,660, of which £4,788,831 had been repaid, leaving the amount outstanding £9,141,826.

Owing to the electrification of the horse tramways, capital expenditure of £2,021,689 has become obsolete, of which, after taking all credits into account, £943,711 has still to be provided for, besides a further amount of not less than £117,826, representing expenditure incurred in connection with electric traction which has also been rendered obsolete, while much more is obsolescent.

The outlook is far from hopeful. Increased payments to drivers and conductors, and heavy salaries for newly-created officers, make large holes in any increase in revenue from passengers; yet the Council continues to make bird pecks—they can't even be called bites—at the passenger-fare cherry.

True, it has "suspended" halfpenny fares and return tickets, with the prospect of reaping a benefit of about £315,000 a year, or about £1,000 per work-day, from these sources; but it studiously refrains from touching the workmen's fares, though the people who benefit by them are by no means the poorest or worst paid of the wage earners who travel by the Council's tramcars. It has been often remarked by workmen themselves that those who can afford to live some distance from the centre of London, and who, therefore, can get houses at cheap rents and low rates, get also the cheapest tramway fares, and this is borne out by the reports of the Highways Committee, which show that a workman living in the neighbourhood of the Tower Bridge (where neither rents nor rates are low), who travels daily to Waterloo Station, a distance of 2 miles only, has to pay 1d. for a single or 2d. for a return ticket—just the same as the probably better-off artisan who dwells in a suburban "villa" in the Beckenham or Bromley district, but is employed in the neighbourhood of Victoria Station, who can ride 9½ miles each way for the same money. The average length of the workmen's routes is over 5 miles for a penny fare. The poor clerk, or underpaid shop girl or waitress, whose hours are from 8.30 or 9 a.m. to any time at night, does not benefit at all from cheap tramway fares. He or she has to pay three times as much as the better-paid workman for the same distance, or get up to town an hour before office or shop is opened for business, and waste that time in aimless wandering about the streets in all sorts of weather, tiring himself or herself out, or getting drenched with rain, and laying the foundations for future illness, before the day's work is begun.

The Council has at last decided that the issue of transfer tickets shall be limited to places to or from which there are no direct services, and that such tickets shall be available for change of cars at specified points only. It is to be hoped that these tickets will in all cases be cancelled on the second car; cases have been known of 3d. transfer tickets issued in the morning at Woolwich being used on the Tooting and Merton lines late at night on the same day; and, in some cases, of transfer tickets, issued three weeks previously, still remaining uncanceled, though the holder rode on the cars daily without being called upon for another fare. Inspection appears to be woefully deficient. The chairman of the Highways Committee stated:—"The tramways have been of late systematically defrauded, not only by a section of the public, but by members of our own staff. People crowding off the cars have handed the fare to the conductors, but no tickets have been given. In some cases there has been no attempt to collect fares, but a hat has been handed round for the benefit of the driver and conductor." He also stated that "the loss from non-collection of fares and fraud had been estimated at from 5 to 15 per cent. of the takings." Though these figures represent from £125,000 to £375,000 a year, the one-time correctly named Progressive party has recently, on each occasion that reform was proposed, carried its opposition to the means of preventing these frauds to the extent of dividing the Council in several party divisions.

The expression "wrecking the tramways" has taken a new meaning, and the thanks of the general public—all tramway passengers included—will be given to Mr. G. H. Hume if, during his chairmanship of the Highways Committee, he will still more courageously root up the abuses which have nearly destroyed the tramway enterprise, and stop the dry rot that has developed in the system.

It should be recognised that under present conditions of

travel on the tramways, with the maximum possible loading of cars twice a day—two hours in the morning and two hours in the evening, which are the real business traffic hours—the maximum carrying capacity of the present County Council routes cannot much, if at all, exceed 600,000,000 passengers a year, and that to safely provide for all costs and charges, the average fare per passenger must be 1.16d. at least, which would represent with rather over 12 passengers per car-mile an average of 14d. per car-mile in revenue.

The irregularity of the services on some lines, as on the Tooting and Merton and Norbury routes, for instance, should be remedied. On these lines it is not unusual to see two or more cars for the same destination following each other in quick succession, with long intervals between the next following ones, the result of which is the filling of motor-buses to overcrowding, and consequent loss to the tramways. A nominal six minutes' service should not produce ten-minute intervals without a "Selection by the Band."

Fares on the L.C.C. tramways bear no relation to distance or cost of operating. From Abbey Wood, Kent, to Waterloo Bridge, on the Victoria Embankment, either by way of Blackfriars, New Kent Road, New Cross and Woolwich, or by Westminster Bridge, Kennington, Camberwell, New Cross and Woolwich—a distance of over 14 miles—the ordinary fare is 3d. only (or less than a farthing per mile); while, as has been seen, a person taking a workman's ticket can travel 19 miles for 2d.

In Glasgow, where the tramways cost less than 42 per cent. of the cost of construction and equipment of the London lines, the fare is about $\frac{1}{2}$ d. per mile, or twice what it is in London. Glasgow has also repaid the total capital expenditure on its tramways.

If the London County Council were to make all fares 1d. for any distance up to 2 miles, with $\frac{1}{2}$ d. additions for every additional mile or part of a mile, and give workmen return tickets for single fares, the tramways would be at once placed on a paying basis without injustice to anybody.

SOME NOTES ON STAFF ORGANISATION IN ELECTRICITY WORKS.

BY G. W. STUBBINGS.

THE present article is intended as a contribution to the discussion on the organisation of the staffs of electricity undertakings, and is written with a view to inquiring whether a particular system, the adoption of which is becoming more general, is capable of improvement. The system in question can be briefly defined as one in which the staff consists of a chief engineer with four departmental assistants concerned respectively with the secretarial, commercial, generating, and distributing section of the undertaking, each being directly responsible to the chief engineer. The writer's remarks are intended to apply to stations of moderate size, having an output of the order of 10,000,000 units per annum.

It will be interesting first to trace the development of the organisation of the staffs of electricity works, and to see how the particular system referred to was evolved. In the early days of electricity supply, when the technical skill required to run a works was considerable, and the business was fairly small, the chief was mainly concerned with technical matters, and was, in fact, the man who ran the job. With the development of the undertaking it became necessary for the chief engineer to have an assistant, such assistant being an all-round man, competent, in the absence of the chief, to supervise all branches of the work, and *au fait* with all the details of the plant. As the scope of the undertaking became further extended, it became clear that the multiplication of general assistants was impracticable. In the first place, as more and more purely managerial work devolved upon the chief, he was able to devote less and less time to technical work; and, secondly, the money available for salaries necessitated the limiting of the number of general assistants to one, the chief assistant engineer. More

recently, the system of having departmental assistants, directly responsible to the chief, has been evolved. The remarkable characteristic of this system is, of course, the abolition of the chief assistant. This radical departure from previous practice has worked very much better than would be expected. It possesses the great advantage of cheapness, as the saving to the undertaking, even after duly increasing the salaries of the departmental officials in recognition of their extra responsibility, is considerable. The advocates of this system consider that the cost of retaining the services of an official additional to the chief engineer, capable of, and possessing the necessary qualifications for, controlling all departments of the undertaking, would be prohibitive, at any rate, for stations of moderate size, and that unquestionably money is better expended in increasing the salaries of the departmental assistants. On the other hand, with this system, there is no one, in the absence of the chief, to assume complete responsibility, as it obviously creates difficulties to assign such a post to either the works or the distribution engineers if these officials be of approximately equal status. The chief assistant seems, moreover, the right man to undertake such work as the designing and preparation of schemes for not only extensions, but also for the various minor alterations and improvements that are continually taking place in an up-to-date works.

The functions of the four departmental assistants may be briefly considered. The secretary or chief clerk takes charge of work quite separate from engineering, and such work falls naturally into a division by itself. The status usually assigned to this official need not, therefore, be discussed.

The case for the commercial assistant or publicity manager is not, perhaps, so clear. There has been a great tendency lately to magnify the importance of this official, but in a moderate undertaking the wisdom of such a course seems to be questionable. The smaller part of publicity work, that of canvassing new consumers, or introducing small heating and cooking apparatus or small motors, does not call for a very highly-trained or highly-paid official. Regarding the supply of electricity to large power consumers, there is no doubt that the personality and business experience of the representative of the undertaking will be an important factor contributing to success, and it seems quite clear that in moderate sized undertakings no better person can be found for this task than the chief. His status, address, technical skill and business ability will carry greater weight than that of a junior official, and as such negotiations are comparatively rare, the undertaking could not afford to retain the services of an official possessing qualifications for such work comparable with those of the chief. It seems clear, therefore, that the publicity manager need not be a man of very great importance, and, indeed, the suggestion of amalgamating the clerical and commercial departments is worthy of consideration for the smaller undertakings. A larger salary could be paid to the secretary, who would in such case be a man of commercial as well as secretarial experience.

In a system of staff organisation recently described in this journal, the official in charge of the publicity department was designated consumers' engineer, and was responsible for not only commercial work, but also for the test-room, installation and public lighting departments. It seems difficult to justify the amalgamation of four sections so totally dissimilar; the first commercial, the second scientific, and the last two concerned with maintenance work. The only sort of explanation that can be found for such a combination is that the work with which these sections are concerned is external to the works and above ground, as in no other characteristic do they agree. With a department of so heterogeneous a character, the official in charge can hardly be expected to be *au fait* with all phases of the work; and as his abilities will presumably be of a commercial character, the men really responsible for the other sections suffer in status. If, on the other hand, the consumers' engineer is chosen for his ability to supervise testing, installation, or public lighting maintenance work, there is no guarantee of his commercial ability, and the suggestion to amalgamate this section with the clerical department seems the more reasonable. The

writer is not aware whether this arrangement is a usual one, but, considered from a rational standpoint, it appears, owing to the varied nature of the work concerned, to be as defective a scheme as could be devised.

The works department is another which is divided naturally from the others, and the duties and scope of the responsibilities of the works superintendent are well defined. It is becoming more and more realised in these days that the greatest need for supervision is in the boiler house, and it therefore seems advisable that in moderate undertakings the works engineer be chosen more for his boiler house than his engine room experience.

The fourth department to be considered is usually known as the distribution department, and the responsibilities of the official in charge are frequently very varied, comprising as they usually do everything left over from other departments. In various concerns, mains, public lighting, testing, installation, tramway overhead equipment, and occasionally fire alarms are under the control of the distribution engineer. Obviously, it is expecting a good deal to require a moderately-paid official to have had experience in all these branches. His first requirement is naturally to be a skilful mains engineer, and presumably the greater part of his experience will be concerned with mains work. Some of the other sections, such as wiring or tramways overhead equipment work, have a natural and close connection with mains work; but in the case of testing of instruments and meters, the connection is not so obvious. The arrangement is, however, common, and in practice works very well.

The assistants of these four officials will be similar in experience and general qualifications to their departmental chiefs, and such men will have in view either promotion to the post of their immediate superior, or a similar position elsewhere.

An examination of the scope of the control of, and the qualifications requisite for, each of the four officials considered, draws attention to the fact that in none of them is there any great need or desirability of any particular scientific technical ability. The station and distribution superintendents are the only two officials who can really be called engineers, and with both, the side of engineering with which they are most concerned is applied, as opposed to scientific. As before remarked, the assistants of these officials will approximate to them in technical character, and thus it happens that in many central stations there is no one with any particular scientific ability, and, according to the usual arrangement, there is no one who need have such a qualification. In running a central station, scientific questions are continually cropping up, but owing to the engineering officials having applied themselves largely to other matters, the scientific knowledge that they acquired early in their career, if any, has probably got rusty or obsolete. This is regrettable, as often leading to mistakes which, though of small importance, could be avoided, and frequently necessitating reference to manufacturing firms for technical advice. There is no particular harm in this latter circumstance, but it is not as it should be. The question therefore arises as to the advisability of having a further official, whose chief qualification shall be scientific and technical ability, directly responsible to the chief engineer, and who will take charge of all work of a technical or scientific character. Such an official, who might be designated technical assistant, would primarily be responsible for the testing and maintenance of all meters and instruments, and would carry out other testing work such as that of fuel and water; he should also be a good draughtsman, competent to carry out such drawing work as is required in a station of the size under consideration. Such an official may be considered a kind of glorified meter superintendent, but the great difference between this official and the meter superintendent is not only in status, but in salary. If it be assumed that by restricting the scope of the responsibilities of the mains engineer, and by abolishing the commercial assistant, as suggested, a considerable sum of money is liberated for the salary of the new official, the undertaking would be able to obtain a really first-class man. Such a post would enable the chief engineer to rely upon at least one man of his staff to keep his scientific knowledge up to date, and such a man, having the requisite status, could be, and probably would

be, consulted on subjects coming within the scope of his particular knowledge.

It has long been a matter of observation to the present writer that, under present conditions, there is little prospect of advancement in central station work for men whose abilities are rather scientific than inclining to running or maintenance work. Many a young man has started a central station career with a brilliant scholastic record—not necessarily of the academic order, but quite conforming to the ideals of Prof. Perry. Such men, seeing how little their qualifications are valued in the career they have chosen will frequently allow their knowledge to become rusty, and will endeavour to make themselves capable shift engineers or mains superintendents, quick and decisive in times of breakdown. Possessing qualifications in one direction, it is exceedingly unlikely that they will exhibit them in another, and such men become mediocre and nonentities. If it be recognised that there is no place in a central station for men such as have been described, these would simply be instances of their having chosen unsuitable careers; but this can hardly be the case. With three-phase distribution, even an ordinary meter superintendent should have a moderate scientific knowledge thoroughly to understand his work. There is little doubt that if a definite place were found for them, men would be attracted to central station work who would be found invaluable. The engineers in charge of large test rooms are, of course, important officials, but such posts are rare. The writer's remarks refer to stations of moderate output.

In considering the question forming the subject of this article, the writer has endeavoured to take up a more or less detached standpoint—such as that of a shrewd business man, knowing nothing of electricity, who has had central station routine thoroughly explained to him. The suggestions may not be considered altogether practicable, but the writer hopes that, as they are somewhat original, they may be found a little interesting.

SECOND REPORT OF THE COMMITTEE FOR THE INTERCONNECTION OF THE LANCASHIRE AND CHESHIRE ELECTRICITY SUPPLY SYSTEMS.

WE have received from the hon. secretary a copy of a report just issued by the Committee which has been dealing with the interconnection of the Lancashire and Cheshire electricity undertakings. The first report was published in our issue of October 13th, 1916; the report now issued gives practical shape to the matters discussed in the earlier one, and so far as the first portion, dealing with interlinking, is concerned, is signed by—

Mr. S. L. Pearce, *Chairman*.
Mr. B. Welbourn, *Vice-Chairman*.
Mr. J. A. Robertson, *Hon. Secretary*.

Sir John A. F. Aspinall, Messrs. R. Blackmore, S. E. Britton,
H. Dickinson, E. H. Edwardes, John Purrett,
S. J. Watson, P. P. Wheelwright, and W. J. H. Wood,
Members of Committee.

Introduction.—1. The interim report presented by the Committee in September, 1916, to the supply authorities and the Board of Trade formed the basis of the conference held in the Council Chamber of the Town Hall, Manchester, on March 2nd, 1917, which was presided over by Mr. G. H. Roberts, M.P., Parliamentary Secretary to the Board of Trade.

2. The conference revealed a striking degree of unanimity with the principles set out in the interim report, and as a result of the invitation extended by Mr. Roberts to the conference, the Committee have worked out the essential details of the scheme which are embodied in this report.

3. The Committee now have pleasure in submitting their second report, which may conveniently be divided under the following headings:—

- (a) The constitution of the proposed joint board.
- (b) The powers of the proposed joint board.
- (c) The basis for determining the charges for electricity supplies between participating authorities.

(d) The basis for allocating the capital charges on interconnecting mains and transformers against the revenue accounts of the participating authorities.

(c) Miscellaneous provisions.

The Committee have also come to the conclusion that the interconnection of the several supply undertakings is but the first step to be taken in the reorganisation of the existing interests with a view to securing an adequate, cheap, and reliable supply of electrical energy for industrial and all other purposes.

They have therefore added a further section to the present report, setting forth their considered opinion in regard to:—

(f) The conferment of additional powers upon the joint board in regard to the establishment and control of all future power stations, and the further control of existing power stations where deemed desirable in the national interests.

(g) The relation of the joint board to the existing Government departments, or to any new electricity tribunal that may hereafter be set up.

Constitution of Proposed Joint Board.—4. The Committee propose (with the assistance of fresh legislation) the establishment of a joint board, representative of the local authority and company interests.

Every authorised distributor of electrical energy shall be entitled to representation on the joint board.

The basis of local authority representation shall be the "population" of the area supplied under statutory powers, viz.:—

One representative for a local authority with a population not exceeding 25,000.

Two representatives for a local authority with a population in excess of 25,000 but not exceeding 50,000.

Three representatives for a local authority with a population in excess of 50,000 but not exceeding 100,000.

Four representatives for a local authority with a population in excess of 100,000 but not exceeding 200,000.

Five representatives for a local authority with a population in excess of 200,000 but not exceeding 350,000.

Six representatives for a local authority with a population in excess of 350,000, but not exceeding 500,000.

Seven representatives for a local authority with a population in excess of 500,000 but not exceeding 700,000.

Eight representatives for a local authority with a population exceeding 700,000.

The basis of company representation shall be "capital outlay," in comparison with the other undertakings.

A schedule sets forth a list of the "authorised distributors" included in the groups of the interim report; the joint board if constituted at the present time would comprise 35 undertakings, with a membership of 90, but any undertaking hereafter eligible shall be entitled to representation.

In the event of one or more of the companies being excluded for any reason from the joint board, it shall be competent for the joint board to enter into working agreements with such companies.

A revision of the representation of the joint board shall be made every five years.

5. Recognising the disadvantages that would accrue from too large an administrative body, the Committee propose that the joint board shall be divided into district boards, whose members shall be those representing the undertakings corresponding to the groups.

Each district board shall elect a chairman from amongst its own members.

The engineer of each undertaking shall be entitled to attend the meetings of the respective district boards.

6. A central executive of 20 members shall be elected from the district boards.

Each member shall be elected for a period of three years, but shall not remain a member of the central executive if he ceases to be a member of the participating authority by whom he was elected.

The central executive shall elect a chairman from amongst its own members.

Powers of the Proposed Joint Board.—7. The Committee propose that the 35 authorities (local authority and company) at present exercising statutory powers shall be constituted by Act of Parliament as a joint board for the purpose of jointly exercising each and all of the following general powers:—

(a) To co-ordinate and prescribe the running hours of the existing generating stations in such a way as to yield the most economical operating conditions.

(b) To determine the basis of charges to be made between the various authorities constituting the joint board for:—Bulk supply, stand-by supplies, reciprocal supplies.

(c) To allocate all charges against revenue account arising out of the expenditure of moneys on linking-up mains, transformers, and such other works as may be required for interconnecting purposes.

(d) To allocate the administrative expenses of the joint board between the various participating authorities, such allocation being based on their respective incomes.

(e) To act in an advisory capacity in regard to all proposals for future extensions of generating plant and linking-up mains, transformers, and such other works as may be required for interconnecting purposes that may be put forward from time to time by one or other of the several authorities direct to the proper Government tribunal.

(f) To empower the joint board to make working arrangements between the power companies and the local authorities, and between one local authority and another, for the use of the existing mains, and with reference to the laying of new linking-up mains within the areas of the several undertakings participating in the joint scheme of operation, and in such other areas as it may be found necessary to lay linking-up mains.

(g) To appoint such officials as may be necessary to carry out the powers and instructions of the joint board.

(h) To form district boards representative of the undertakings included under the groups, or such modifications thereof or additions thereto as may hereafter be considered necessary, and to delegate to the district boards the powers set forth below, and such other matters as the joint board may from time to time decide.

(i) To form a central executive of the joint board elected from the several district boards, and to invest such central executive with the powers set forth below, and to deal with such other matters as the joint board may from time to time decide.

(j) To invest the authorities constituting the joint board with compulsory powers to obtain wayleaves for electric mains, and overhead lines.

(k) To invest the authorities constituting the joint board with compulsory powers to lay mains in undedicated streets.

(l) To invest the authorities constituting the joint board, with compulsory powers to erect overhead lines crossing public roads.

(m) To invest the joint board with powers to make regulations in regard to all technical matters affecting linking-up mains, transformers, and such other works as may be required for interconnecting purposes in order to secure uniformity and reliability of supply.

(n) To carry out such further powers as may be delegated to them from time to time by the proper Government tribunal.

(o) To apply to Parliament for any alteration or extension of their powers, including the granting of new powers.

(p) To issue precepts to the participating undertakings for the purpose of meeting the administration expenses of the board.

(q) To apportion the costs, charges, and expenses—Parliamentary or otherwise—preliminary and incidental to the setting up of the joint board, on the basis of the capital outlays of the participating undertakings.

8. In the event of it being shown to the satisfaction of the joint board that any undertaking has been adversely affected financially by the operation of the above powers, it shall be incumbent upon the joint board to allocate the charges between the participating authorities so as to reimburse the undertaking so affected.

9. The authorities constituting the joint board shall be empowered to enter into agreements with any authority, company, or person for the following purposes: Bulk supplies, stand-by supplies, reciprocal supplies, provided that no such powers shall be exercised within the area of an authority exercising statutory powers except with the consent of such authority. In the event of the consent being unreasonably withheld, an appeal may be made to the proper Government tribunal to dispense with such consent.

10. The Committee propose that the joint board shall delegate the following powers to the district boards:—

(a) To appoint their representatives to act on the central executive of the joint board.

(b) To co-ordinate and prescribe, subject to the approval of the central executive of the joint board, the running hours of the existing generating stations within their group in such a way as to yield the most economical operating conditions.

(c) To determine, subject to the approval of the central executive of the joint board, the charges to be made between the various undertakings within their group for: Bulk supplies, stand-by supplies, reciprocal supplies.

(d) To make recommendations from time to time to the central executive of the joint board with regard to the interconnecting of two or more of the existing undertakings within their group, or with one or more undertakings of another group.

(e) To allocate, subject to the approval of the central executive of the joint board, the charges against revenue account arising out of the expenditure of moneys on linking-up mains, transformers, and such other works as may be required for interconnecting purposes between the various participating authorities within their group.

(f) To receive and consider the recommendations of any undertaking in the matter of extensions to their generating plant, and to report thereon to the central executive of the joint board, provided that nothing herein is intended to prevent any authority, after its application has been adjudicated upon, from applying direct to the proper Government tribunal under its existing or future rights for powers to borrow money, or to otherwise raise capital for generating plant extensions.

(g) To carry out such further powers as may be delegated to them from time to time by the joint board.

Note.—It shall not be competent for the district boards to incur any administrative expenditure without the direct sanction of the joint board.

11. The Committee propose that the joint board shall delegate the following powers to a central executive elected from the several district boards:—

(a) To draw up such rules and regulations as may be necessary from time to time for the guidance of the several district boards in giving effect to the various powers delegated to them.

(b) To control the co-ordinated and prescribed running hours of the several groups of undertakings respectively controlled by their district boards.

(c) To formulate the basis of the charges to be made between the various undertakings in the respective groups, and between one group and another, in regard to bulk supplies, stand-by supplies, reciprocal supplies.

(d) To consider the recommendations made to them from time to time by the several district boards in regard to the provision of interconnecting mains, transformers, and such other works as may be required for interconnecting purposes, and, if approved, to support the necessary application on their behalf to the proper Government tribunal.

(e) To receive, approve, or otherwise, the reports of the district boards from time to time respecting all proposed applications for extensions to generating plants, provided that nothing herein is intended to prevent any authority, after its application has been adjudicated upon, from applying direct to the proper Government tribunal under its existing or future rights for powers to borrow money, or to otherwise raise capital for generating plant extensions.

(f) To sanction, or revise, the proposed allocation of all charges against revenue account arising out of the expenditure on linking-up mains, transformers, and such other works as may be required for interconnecting purposes made by the several district boards.

(g) To apportion the administrative expenses of the joint board between the various participating authorities, and to refer same to the joint board for confirmation—the basis of such apportionment to be the gross revenue of the participating undertakings.

(h) To report to the Government department or tribunal on any application made to them by any single authority who are at present exercising statutory powers, or who may hereafter apply for such statutory powers, to raise money for generating plant extensions.

(i) To recommend to the joint board the appointment, from time to time, of such officials as may be necessary to carry out the powers and instructions of the joint board.

(j) To appoint a committee of engineers to whom all technical and engineering matters shall be at first referred for a report, provided that the said committee of engineers shall be entitled to seats on the central executive committee, but shall have no voting powers thereon.

(k) To carry out such further powers as may be delegated to them from time to time by the joint board.

12. Should any dispute or difference arise between any undertaking and the district board, or between a district board and the joint board, the same shall be referred to the proper Government tribunal for a decision—which shall be final and binding on the parties concerned.

13. Under the foregoing paragraphs it will be observed that the Committee do not propose to invest the joint board with any financial powers to raise capital from time to time. In this respect, their present proposals differ from those set forth in the interim report, which contemplated the raising of capital for purely interconnecting works, *e.g.*, linking-up mains and transformers, &c.

On further consideration the Committee have come to the conclusion that under existing conditions there are no material advantages to be gained in relieving each undertaking of its statutory obligation to raise the necessary capital for interconnecting mains extensions within its own area, provided always the scheme is initiated or approved by the joint board, the important point being the correct allocation of this expenditure between participating authorities.

14. The Committee further recognise that the position of the companies under the proposals contained in this report will require special consideration by reason of the fact that their electrical output is now given under one or other of the following headings:—

(a) Bulk supplies to authorised distributors.

(b) Bulk supplies to authorised distributors, and individual supplies to large power users in the area of the latter.

(c) Supplies given in districts, the provisional orders relating to which have been transferred to the companies for stated periods.

(d) Districts in which the companies have taken out and now hold the provisional orders.

(e) Districts in which no provisional order had been taken out prior to January 1st, 1908, and which the Lancashire Power Co. are supplying by virtue of their Acts.

(To be continued.)

Australian Bureau of Science.—A meeting of the Advisory Council of the Commonwealth Bureau of Science and Industry was held in Melbourne last month, with the object of establishing the bureau on a permanent basis. It is proposed to appoint permanent directors. The Prime Minister (Mr. Hughes) stated that the bureau had already done much good work. It was engaged at present on a number of scientific problems in connection with the metal industry.—*Melbourne Age*.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Employment of Disabled Soldiers.

The letters from "E. M. F." and Alfred Bridges in the current number of the REVIEW prompt me to write this, my first letter to any paper.

I agree with you that it is an insult to offer employment to a man disabled through the war in the worst paid profession in the country. The company advertising no doubt feel that since a discharged man will possibly receive a pension, he may be able to live on his income, and as regards intelligence of officers, the number that apply for a position in a power station must be the means of gauging it.

It is claimed that the station man gets less pay than a man in another trade calling for less skill. For this condition the station man is to blame, since he lacks organisation; and at this moment, when the opportunity is put forward in the Station Engineers' Branch of the E.T.U., the difficulty of getting many men to see the advantages is a point which does not show the station man in a favourable light if a comparison of intelligence is made.

Every profession has its association, which grants certificates of efficiency to its members, thus keeping those undesirables out, who might through influence enter into competition with them for their job.

A switchboard job, while things run smoothly, can be done as a matter of routine by any one of normal intelligence, and it is upon this theory that rates of pay are fixed.

It is hardly likely that any undertaking, private or municipal, would put any difficulty in the way of such an organisation as the S.E. branch, since it would assure a proper degree of efficiency, and a desire to study and become the possessor of a licence or certificate among the staff. When one sees advertisements in the REVIEW for shift engineers at 35s. per week and ticket inspectors on the street railways at £3, one cannot help but see the excuse for the public thinking the position of the engineer is a soft one, calling for no special skill at all.

If the claim of a high standard of intelligence among power station men be true, there will not be one outside the Station Engineers' Branch of the E.T.U. in another two weeks; then, and not before, they may expect to get white men's hours and pay.

I can quite understand the attitude of the switchman and shift engineer towards an ordinary union, but in the revived association mentioned they will find a remedy for their ills. I advise all interested to find out the time and place of the next meeting and go.

Megger.

[With regard to the pension question, which is likely to assume some prominence during the next few years, we desire to enter a strong protest against the policy referred to by our correspondent as a possible explanation of the advertisement under discussion. Any employer who pays a man at a lower rate than his services are worth because he has a pension is putting a corresponding part of that man's pension into his own pocket, defrauding the State and the pensioner. We do not accuse any one of having done this; but we fear that cases of the kind may be met with, and we trust that our readers will unhesitatingly show them up.—*Eds. ELEC. REV.*]

The Psychology of Shift Work.

In your issue of the 3rd inst., Mr. A. H. Holt, in his letter on "The Psychology of Shift Work," suggests as a possible remedy of its evils, the formation of a Staff Engineers' section of the E.T.U.

This, I am proud to say, to all intents and purposes already exists, Station Engineers' Branches having been formed in London (three), Manchester, Glasgow, and Birmingham, and they are under consideration, if not already actually formed, in many other large towns.

Speaking for Birmingham, this branch caters for and includes a very large number of staff engineers, and I strongly advise Mr. Holt to get in touch with the Manchester Branch.

Birmingham,
August 13th, 1917.

Thos. N. Morris, Secretary,
Electrical Trades Union.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

Large Lifting Magnet.

An improved Phoenix lifting magnet, 62 in. in diameter, recently tested at Messrs. STEEL, PEECH & TOZER's works, unloaded a truck-load of steel turnings in 7 minutes, which work ordinarily takes four men five hours to do; it filled four large furnace boxes in four lifts with $3\frac{1}{2}$ tons of metal; a truck load of tube scrap, weighing 7 tons 7 cwt., was emptied in $6\frac{1}{2}$ minutes. It is considered that the magnet would lift a solid ingot weighing 70 tons. The magnet

weighs 65 cwt. and requires about 50 amperes at 220 volts; the controller enables the load to be partly discharged if desired, and a safety device can be fitted to ensure the load being maintained even if the main current is interrupted.—*Iron and Coal Trades' Review*.

Pocket Lamps.

Amongst a variety of designs for pocket lamp cases, MESSRS. ROSE BROS., of 25, Milton Street, E.C. 2, have introduced a "trench lamp" finished in khaki enamel, in which light is obtained only by lifting the top, as here illustrated. Short-circuiting is impossible. This case takes the standard three-cell battery. It will be

FIG. 1.—TRENCH LAMP.

noticed that the top forms a hood over the lamp, preventing the escape of the rays in undesirable directions, and there is no possibility of the battery being accidentally run down by pressure on the lamp in the pocket. They are also making a pocket accumulator lamp, in which the cells are packed with glass wool; when the cells have been charged, the acid is drawn off, making the lamp unspillable. Other items, in addition to their usual lines, are new types of medical coils and a stock of general accessories, bell-wire, &c.

A Large Self-cooled Transformer.

Oil-insulated, self-cooled transformers contained in fluted tanks were, until recent years, limited to about 500 kw. capacity, and units larger than this were usually of the oil-insulated, water-cooled or air-cooled type. However, with the development of the outdoor sub-station there was created a demand for large transformers that would operate in any climate and under all kinds of

FIG. 2.—RADIATOR-TANK TYPE OUTDOOR TRANSFORMER.

weather conditions without an attendant. This gave new life to the self-cooled oil-insulated type of transformers, and new designs were developed. The result is that the sizes of self-cooled oil-insulated transformers have been increased until they have reached the proportions of the one shown in the illustration. This unit is said

to be the world's largest self-cooled transformer, and was built by the GENERAL ELECTRIC CO., Schenectady, N.Y. Six of these units have been constructed for the Carnegie Steel Co. They are single-phase, 25-cycle, 8,000-K.V.A. each, giving a total capacity of 48,000 K.V.A., and step the voltage down from 44,000 to 6,600.

The unique feature of these transformers is the construction of the external radiators, which consist of a number of vertical flattened tubes rigidly welded into headers which are flanged for bolting to the tank. The 24 radiators give a radiating surface of 800,000 sq. in. As the oil is heated in the containing tank, it rises to the top of the tank and out into the radiators, while the cool oil flows in at the bottom, thus producing automatic circulation of the oil through the radiators. All seams and joints in the tank and radiators are welded to prevent oil leaking. The radiators are self-draining and have no pockets, preventing the accumulation of air at the top or moisture and sediment at the bottom.

The transformer winding is of the circular-disk-coil interleaved type mounted on the centre leg of a three-legged core.—*Elec. World*.

Indian Ink Eraser.

An eraser has been introduced with which Indian ink can be completely cleaned from tracing cloth. It is claimed that it leaves no trace of the ink, and does not injure the cloth. The article is being sold and manufactured under the trade name "Rasindia," by MR. E. H. ANDERSON, at 272, East 199th Street, New York, U.S.A.

LEGAL.

ALLEGED UNLAWFUL POSSESSION.

At the Mansion House Police Court on the 10th inst., Wm. James Mansell 33, an electrician of Woodley Road, Stoke Newington, was charged, on remand, before Sir John Knill, with being in the alleged unlawful possession of one electrolier, an electric standard, and fittings, supposed to have been stolen.

MR. HENRY WELLS, acting secretary of the General Electric Co., Ltd., said the fittings were of their manufacture, but he could not say that they had been stolen from them.

MR. DOUGLAS (Chief Clerk): Do you sell wholesale or retail?

WITNESS: Wholesale. They had not got prisoner's name on their books as a customer. The value of these articles was about £9.

SIR JOHN KNILL said he was satisfied that prisoner was not honestly in the possession of the articles, and sentenced him to 14 days' hard labour.

GENERAL ELECTRIC CO., LTD., AND THE BRITISH GENERAL ELECTRIC CO., LTD., v. J. OSSAWA & CO.

ACCORDING to a Sydney newspaper, on June 22nd, in the Australian Courts, Mr. G. E. Flannery appeared for the plaintiffs, and Mr. F. R. Jordan for the defendants, of York Street, Sydney, in this matter, in which the plaintiffs applied for an injunction restraining the defendants from infringing the former's trade mark.

His HONOUR made the following orders in terms of the statement of claim, viz.:—(1) That the defendants be restrained from infringing the trade mark on certain electrical apparatus of the plaintiff, the General Electric Co., Ltd.; (2) that the defendants be restrained from passing or attempting to pass the defendants' goods as the plaintiff company's goods; (3) that the defendants deliver up all apparatus in their possession which offend against the above injunction.

REFUSAL TO GRANT A LEAVING CERTIFICATE.

THE refusal of the Bristol Corporation to grant a leaving certificate to H. J. Bridge, a wireman employed in the sales department of the electricity department, formed the basis of an appeal to the Bristol Local Munitions Tribunal, when the chairman of the Tribunal found that reasonable grounds had been established for the withholding of the certificate. The complainant alleged that the Corporation acted unreasonably in refusing the certificate, inasmuch as they did not comply with the Fair Wages Clause; he was an electrical fitter, a member of the A.S.E., and was paid at the rate of 11d. an hour for 53 hours, which was equal to a wage rate of 45s. 10d. per week of 50 hours; in addition, he received a 4s. war bonus. The district rate for an engineer's fitter in a "shore shop" in the Bristol district had been 50s. a week of 53 hours since the award of the Committee of Production, which came into operation on April 1st, 1917. The complainant contended that there was no distinction in that district between an electrical fitter and any other fitter, and that the rate should be 50s. a week of 53 hours.

The respondents contended that the engineers' rate above-mentioned was not applicable to their establishment; the work done was similar to that of the local electrical contractors, whose electrical fitters were paid at 10d. an hour for a 50-hour week; and as they were paying complainant 11d. an hour, they were paying more than the district rate, and therefore complying with the Fair Wages Clause; also the award of the Committee of Production had no application to their establishment.

The judgment stated that the award did not apply to the shops of electrical contractors, and that the respondents had not

infringed the Fair Wages Clause: they had reasonable grounds for refusing a certificate to the complainant, and the complaint was dismissed.

COLLIERY ELECTRICIAN FINED.

At the Wigan County Police Court, on August 3rd, Clifton Ramsdale, electrician, was summoned by the Wigan Coal and Iron Co. for failing to examine electrical apparatus at a mine. Mr. T. ELLIS appeared to prosecute, and said the defendant was employed by the prosecuting company as an electrician. On July 9th the defendant should have inspected Aspull Moor pumping pit, but he said some men were employed in the pit shaft, and therefore he could not make the examination. That might have been so, said Mr. Ellis, but defendant could quite easily have reached the apparatus another way. He entered in his log-book that an examination had been made, and made the entry "All in order" for that date. A fine of 40s. was imposed.—*Wigan Observer*.

SOUTH LONDON ELECTRIC SUPPLY CORPORATION v. CHARLES A. BURBROOK.

At Lambeth County Court, before Judge Hodges, last week, the South London Electric Supply Corporation brought an action against Charles Alfred Burbrook, of 19, Bellevue Gardens, Clapham Road, to recover £4 4s. 2d. for fixing electrical fittings. His Honour gave judgment for the plaintiffs for £3 14s. 8d., with costs.

SOUTH LONDON ELECTRIC SUPPLY CORPORATION v. MRS. L. BOWMAN.

At Lambeth County Court, before Judge Hodges, last week, the South London Electric Supply Corporation brought an action against Mrs. Bowman, of 31, Athenfold Road, Clapham, to recover 11s. 6d. for work done.

Defendant's daughter stated that the fittings were damaged when they went into the flat, and her mother was not responsible for their repair. When the inspector called his attention was drawn to them, and he said he would send a man to do the work.

Judge HODGES: You would not have had them repaired if you knew you had to pay for them?

WITNESS: No.

Judge HODGES said he thought a mistake had been made, and gave judgment for the defendant, with costs.

A DEFECTIVE PORTABLE LAMP.

At Falkirk, on Monday, before Sheriff Moffatt, the Greenock and Grangemouth Dockyard Co., Ltd., Grangemouth, were charged with having on June 7th in their yard, being a factory to which the Factory and Workshops Acts applied, allowed a portable electric lamp to be used by a ship's caulker, now deceased, on board a ship under construction, the lampholder of which was in direct metallic connection with the guard, contrary to the Electricity Regulations, and particular Regulation 13.

Evidence was given for the prosecution that there was no doubt the lamp which the deceased caulker had used was a violation of the regulations. For the defence, evidence was given by several witnesses, including the company's electrical engineer, that a large number of caulkers and riveters had been drafted from Glasgow in order to expedite the work of a particular ship, and the wastage of portable lamps on that ship was extraordinary. Several of the damaged lamps were produced in Court. One witness deposed that he had seen the lamps wilfully thrown at workmen, and he had also seen them placed in position as targets, and washers and nuts thrown at them. The workmen also wasted their employers' time, for when new lamps could not be provided they remained idle until the broken ones were repaired.

A representative from a Glasgow firm of makers spoke to supplying lamps to the company which did not conform to Regulation 13. The lamps were cheaper in the proportion of 2s. 9d. to 7s., and they did not question an engineer's order.

The SHERIFF found the defenders guilty, and imposed a fine of £3. He remarked that he was impressed with the difficulties of the company in carrying out work of vital and great national importance. It would never do for the company to stop work because they could not obtain lamps which conformed to the Government Regulations. That was not common sense, and it might be a question whether representation should not be made to the Home Secretary to have the Regulations made easier at such times. There seemed to be no doubt about the wilful breaking of lamps, and the desire of the workmen to waste their employers' time. He trusted that no such evidence regarding workmen would be given in that Court again, and thought that if the men could be found who had committed the damage allowed to, they should be severely dealt with.

The Metric System.—The British Chamber of Commerce in the Argentine, which has a membership of over 250 British companies and merchants trading with the Argentine, has sent a memorial to the Prime Minister stating that, in the opinion of the Chamber, it is highly desirable, in the interests of British trade abroad, that the decimal metric system of weights and measures should be made compulsory throughout the Empire forthwith.—*Times Trade Supplement*.

WAR ITEMS.

Exports to Switzerland.—The "London Gazette" announces that, by Order in Council, the exportation to Switzerland of celluloid wares, insulating materials, presspahn, and tin wares, with other items, has been prohibited.

Trade with China.—The "London Gazette" for August 10th contains a list of additional firms in China and Siam to whom articles may be exported.

Australia.—The Federal Government has revoked the ban placed by the Federal Attorney-General, under the provisions of the Enemy Trading Act, on the Sterling Telephone and Electric Co., Ltd., and Conrad William Schmidt.

Exports Prohibited.—The "London Gazette" for August 14th contains amendments to the schedule of articles of which the exportation is prohibited. Amongst the additions to the schedule are the following:—Malleable castings—chain fittings, conduit fittings, lamp fittings, pipe flanges, stove fittings, tramway fittings; chemicals—mixtures and preparations containing ethylic alcohol; manufactures of raw hides—pinions, &c., suitable for textile machinery; metal valves of all descriptions.

Foreign-Controlled Companies.—The fourth report of the Enemy Influence Sub-Committee of the Unionist War Committee has just been issued. It deals with the disclosure of the identity of foreign-controlled companies. The report mentions that in deciding what steps should be taken to prevent foreign-controlled companies in the future from passing themselves off as British concerns, care must be taken not to discourage the investment of foreign capital in the business of this country. The Sub-Committee expresses the opinion that it would be reasonable to require that where a company or corporation carrying on business in the United Kingdom is actually under foreign control, unless the existing title of the company clearly and correctly designates its foreign nature, the fact should be disclosed in its title by adding the words "foreign-controlled," so that everyone having dealings with it, and the public generally, may be aware of such foreign control. In order to ensure the observance of the law, the Sub-Committee recommends that the directors and secretary of every company or corporation should be required to make proper returns, stating the position of the company, to the Board of Trade.—*Financial Times*.

Air-Raid Warnings.—Sir G. Touche asked the Home Secretary whether he was aware that, following the intimation that electric power stations desiring to receive telephonic air-raid warnings by day, such as had always been given by night when there was less risk to machinery and fewer hands employed, should apply to the police authorities, the Associated Municipal Electrical Engineers of Greater London made application, and received a reply suggesting that the object would be met by the arrangements for giving a general public warning when enemy aircraft were reported to be approaching the London area; if he was aware that the public warning was rendered inoperative in the works in consequence of the noise of the machinery and other causes, and if he would reconsider the refusal to give direct warning by day as well as night.

Mr. Pratt said the application from the electrical engineers was received before arrangements were made for a public warning in London, and when the public warning had been arranged for it was suggested that it might suffice for their purposes. He had not received any representations to the contrary from the Association, but he was communicating again with the Association.

Trade Within the Empire.—The Prime Minister has appointed a Committee of Ministers to report on the best methods and machinery by which to give effect to the resolution passed by the Imperial War Conference in favour of special facilities being accorded for the exchange of the products and manufactures of the Empire. It is understood that the Government departments which will be represented on the Committee, of which Mr. Walter Long is chairman, are the Treasury, Foreign Office, Colonial Office, India Office, Ministry of Reconstruction, Board of Trade, Ministry of Shipping, Board of Agriculture, and the Ministry of Labour.

Employment Exchanges.—The Civil Service Correspondent of the *Daily Telegraph* states that Mr. Hodge, Minister of Labour, has decided on a new scheme which will have an important bearing on the future usefulness of the Employment Exchanges, and undoubtedly will commend itself to employers and workers. Over the United Kingdom, until now, only about 20 local advisory committees have been established. In future there will be an Advisory Committee attached to each exchange. The committees will be empowered to discuss anything they choose, and to advise and make suggestions as they think fit. It is estimated that about 300 of these Advisory Committees will be set up all over the kingdom. London will have one Central Committee, but with sub-committees in close touch with each exchange. Under Mr. Hodge's scheme all trades and industries will be represented in one omnibus committee, composed of one-half employers and one-half workers.

Labour Disputes.—Numerous resolutions, it is stated, have been received by the Executive Council of the Amalgamated Society of Engineers from branches and district committees expressing dissatisfaction at the inadequacy of the Committee of Production's award relative to the wages in the engineering and foundry trades. As the result, the Executive Council has sent a letter to the Committee on Production, in which it states it is essential that the Committee should be made conversant with the state of feeling manifesting itself throughout the country among the members with reference to the award, as they deem the advance of 3s. a week totally due to the increased cost of living. The executive has received a communication from Dr. Macnamara to say that the Board of Admiralty has decided that the award shall be applied to workmen in the Royal dockyards, and that instructions have been issued to that effect.—*Daily Telegraph*.

Exemption Applications.—At Rochdale, Mr. G. Webster, tramways manager, appealed for J. Crossley (36, Class A, single), electric wireman, and four married motormen, three Class A and the other B1, and all under 32 years of age. Mr. Webster said he had lost 43 drivers out of 88, and was still 14 short. He was trying to obtain substitutes wherever possible. Crossley was conditionally exempted, and the others put back to November 15th.

At Burnley, an electrical engineer, now in the Army, appealed for an engineer, married, 29, C1, but previously rejected. Exemption to September 30th was given.

At Slough, the Military appealed against absolute exemption held by W. C. Hayward (38, A1), electrician. Hayward was stated to have entire charge of an electric plant. Appeal allowed, certificate cancelled, and three months' temporary exemption allowed, with no further appeal without leave.

At Hereford, Messrs. Harding Bros. appealed for H. C. Owens, electrician; exemption until October 15th.

At Hastings, Mr. Wordley appealed for R. C. Merrifield (40, A1), electrician, and a member of the Fire Brigade; three months' conditional exemption.

At Rammarsh, the Mexborough & Swinton Tramway Co. appealed for the retention of two motormen; one, aged 28, had his exemption confirmed; the other appeal, referring to a discharged soldier, was deferred for further information.

An appeal was made by the Military to the Herefordshire Appeal Court for J. Langford (33, B1), electric light attendant, who had been exempted locally. Respondent was put back to October 1st, with an examination by the Central Medical Board in the meantime.

At Oldham, exemption was claimed for a Corporation tramcar driver (32, B1). It was stated that he was 22 days below the age limit for men employed on work of public utility. He was given exemption until November 1st.

At High Wycombe, an appeal was lodged by E. H. Milner (39, C1), electrical engineer; on his remaining a Special Constable, he was given three months' temporary exemption.

At Castleford, the Military appealed against exemption held by C. J. Cox, electrical engineer, passed for general service. Several firms wrote stating that they were dependent upon Mr. Cox for repairs, &c., and the appeal was disallowed; and the exemption allowed to remain in force.

At Gloucester, conditional exemption was conceded to an electrician (20, C1), said to be the only man left capable of looking after the plant at several theatres. The Military representative intimated that he would appeal against the decision.

Before the County Appeal Court, exemption was claimed by Mr. Albert Wilcox (39, C2), electrical engineer, of Farnham Common. It was certified by the Acting Tuberculosis Officer of the Bucks. County Council that appellant had tuberculosis of the lungs. Six months' temporary exemption was granted.

BUSINESS NOTES.

Electrical Trade with the British West Indies.—The following particulars of the imports of electrical goods into the British West Indies and British Guiana are taken from a report by the Canadian Trade Commissioner at Barbados, which is published in the July 2nd issue of the "Weekly Bulletin" of the Canadian Department of Trade and Commerce:—

Although electricity has been introduced into Barbados, Trinidad, British Guiana, and Jamaica, for lighting and for power for tramways, it has not come into general use, and there is a wide field for its expansion for lighting and domestic purposes. For the whole of the West Indies the value of the imports of electrical apparatus and fittings amounts to only £35,000 a year. This, however, does not include machinery or the large quantity of copper wire required by the tramway, electric lighting, and telephone companies. The value of wire used considerably exceeds the value of electrical apparatus. Of the requirements for electrical goods of all kinds, the United States is at present the largest supplier, but the bulk of these goods came from the United Kingdom previous to the war. The United States has now practically all the trade of Trinidad and Bermuda, about two-thirds that of Jamaica, and more than half that of British Guiana. The United Kingdom comes next, supplying the greater part of the trade of Barbados, about one-third

of that of Jamaica, and practically all the trade of the Windward and Leeward Islands.

There are only three cities in the West Indies that have electric tramway services, namely, Kingston (Jamaica), Port of Spain (Trinidad), and George Town (British Guiana). It is understood that after the war the existing mule tramway system in Barbados will be replaced by an electrical system; the rails and some of the machinery required have already been imported.

Electric motors are being gradually introduced into the larger sugar factories, engineering establishments, cotton ginneries, and also for dental and other minor purposes where electric current can be obtained. In the last few years electric fans have been installed in the principal commercial and public offices. In all the principal hotels and private residences electric bells are now fitted.

Throughout the larger islands complete telephone systems are to be found.

As regards the electric fittings used in the West Indies, &c., it is to be noted that the electric lighting system in Barbados follows the British practice in using the bayonet type of lampholder, but in British Guiana, Trinidad, and Jamaica, the American screw-base type is in use.

In the Windward and Leeward Islands electricity has not been introduced to any extent. Attempts to introduce electric cookers into the larger islands have, up to the present, met with little success.—*Board of Trade Journal*.

Catalogues and Lists.—MESSRS. STERNS, LTD., "Royal London House, Finsbury Square, E.C. 2.—Leaflet relating to "Balagrip Bricks" for balata belts, and "Excelsior Sternoline" for use in screw and automatic lubricators.

THE CREDEBA CONDUITS CO., LTD., Birmingham.—Three showcards executed in colours, showing "Creda" electric fires in the nursery, in the bathroom, and in the trenches—very effectively.

MESSRS. ROSE BROS., 25, Milton Street, E.C. 2.—Special catalogue of pocket lamp cases, pocket accumulator lamps, dry batteries and accumulators, bulbs, &c.

Book Notice.—"Science Abstracts." A and B, No. 235 Vol. XX, Part 7. July 30th, 1917. London: E. & F. N. Spon Price 1s. 6d. each net.

Bankruptcy Proceedings.—FREDERICK BROWN, 8, Stafford Street, Llanelly.—Order of discharge, as from July 6th, 1919.

G. J. T. J. PARETT, 11, Priory Road, Keynsham.—Notice is given of intended dividend. Last day for receiving proofs, August 28th, 1917. Official Receiver, Mr. C. H. King.

Private Arrangements.—BASIL CHARLES COUSENS, 81, Bold Street, Fleetwood, and 6, Albert Square, and Wyre Dock, Fleetwood, electrical instrument maker.—A meeting of the creditors was held at Preston, when a statement of affairs was submitted showing liabilities totalling £1,184. The net assets were £895, disclosing on paper a deficiency of £289. It was stated that the debtor had, owing to proceedings and judgment, consulted his solicitor a few days before the meeting, and it had been considered desirable to protect the assets for the benefit of all concerned. Owing to his being engaged on Government work he was not present at the meeting. There was no offer before the meeting, but several creditors expressed the opinion that it would be better if the debtor could make some proposal. It was decided to confirm the deed already executed in favour of Mr. Todd (Preston), a Committee of Inspection being elected. The following are the creditors:—

British Thomson-Houston Co.,	£27	Falk, Stadelmann & Co.,	£13
"Bankers",	286	Great Grimsby Salt Co.,	16
Bowcock & Wilkinson	57	Heath & Co.,	91
Baxendale & Co.,	18	Munroe & Co., Ltd.,	11
Baxendale Bros., Ltd.,	486	Mason, J. W., & Co.,	23
Cookson, Ltd.,	14	Penman, Dr.,	18
Close, Albert	33	Preston & Sons, Ltd.,	12
Callender's Cable Co.,	33	Potter, John	23
Edelshaw & Sons	16	Parkinson, N.,	14
Fleetwood Trawlers	14	Whittington & Wilson	16

Fire.—Considerable damage was caused by an outbreak of fire at Silvertown early on Saturday morning at the Winchester Street Works of the India-Rubber, Gutta-Percha, and Telegraph Works Co. The outbreak was discovered in a huge building of four floors, and, owing to the inflammable nature of its contents, the two upper floors were quickly involved.—*Financial Times*.

Advance in Prices.—The Sterling Telephone and Electric Co., Ltd., announce that from the 13th inst. all list prices are further advanced 20 per cent., with certain specified exceptions.

Liquidation.—KORTING BROS., LTD., 53, Victoria Street, London, S.W. 1.—This company has gone into voluntary liquidation for the purpose of getting rid of all enemy connections. The business has been sold as a going concern, with all assets and liabilities, to a new company under the name of Kortling Bros. (1917), Ltd., which will carry on the business as an entirely British concern, at the same address.

Company Directors.—The B. of T. has published in the *London Gazette* of August 14th a schedule prescribing the form in which the particulars required by Section 2 of the Companies (Particulars as to Directors) Act, 1917, are to be sent to the Registrar of Companies, and an amended form to be used in making the list of members and summary of capital required by Section 26 of the Companies (Consolidation) Act, 1908, as amended by the former Act.

Trade Between the United Kingdom and Canada.—The Imperial Trade Correspondent at Winnipeg (Mr. W. J. Healey) reports that the Winnipeg Board of Trade (*i.e.*, the Chamber of Commerce) has appointed a new Standing Committee with the object of promoting trade between the United Kingdom and Canada. This Committee, which is to be known as the Imperial Trade Committee of the Winnipeg Board of Trade, is prepared not only to answer all questions by British manufacturers bearing on the trade within the Empire, but to receive, and have properly displayed, samples from any British manufacturer. By this means, it is thought, importers in Western Canada will have an opportunity of handling British-made goods which are suitable for that territory. Samples submitted can usually be sold, and the proceeds, less a small commission to cover incidental expenses, remitted to the exporter. The Committee will also endeavour to establish connections between the importer and manufacturer, or the importer and agent. Communications from the British firms should be addressed to the Secretary, Imperial Trade Committee of the Winnipeg Board of Trade, Winnipeg.—*Board of Trade Journal*.

Trade Announcement.—MESSRS. GRINDLAY, ROSS, AND Co., Ltd., Glasgow, announce their removal to Adelphi Engineering Works, Reid Street, Bridgeton, Glasgow. Telephones: Bridgeton 1721 and 1722. Telegrams: "Grindlay," Glasgow.

Plant for Sale.—Nuneaton Corporation has for disposal a complete electrical plant, suitable for a private installation. Full particulars are given in our advertisement pages to-day.

LIGHTING AND POWER NOTES.

Australia.—Consideration is being given by the Sydney City Council to the question of acquiring a coal mine to provide coal for the municipal electric supply station. A coal-bearing property is being investigated.—*Melbourne Age*.

The Sydney City Council has been advised that the High Commissioner for Australia has been notified that it is impossible to sanction priority for a steam turbine plant for the Council, and suggesting that the Council should reduce the supply of power to private customers, and thus provide adequate supply for national and public purposes.

Balls Head, Sydney, N.S.W., is to be transformed into the largest coaling depot in the Southern Hemisphere, at a cost of about £500,000; stocks of coal of 50,000 tons and upwards will be carried, as well as stores of oil fuel, &c. The colliers will be discharged by mechanical grabs, and the coal sent to the stacks by means of electrical conveyor belts. Electrical weighing machines are included in the plant, and will work in conjunction with the conveyors.—*Colliery Guardian*.

The Wollongong Council has been informed by the Public Works Department that a feeder can be run from the Port Kembla—Cordeaux transmission line, enabling an electric supply scheme to be started.—*Sydney Evening News*.

The Warrnambool (Vic.) T.C. and Water Trust has decided to provide for a future municipal electricity supply in the town by installing new 150-H.P. high-speed engines at the water supply pumping station: until the electric supply is installed, the new plant will be utilised for pumping only.—*Melbourne Age*.

Bacup.—At a meeting of the T.C., Councillor J. H. Lord said there was a general satisfactory increase month by month in the demand for electricity; they had not been able to meet the Rawtenstall Corporation with regard to the question of a bulk supply, but were asking for a conference, so that the matter might be settled.

Canada.—In a recent article, by Mr. W. R. Bonnycastle, in the *Electrical News*, the author draws attention to the power requirements of Vancouver City, advocating that the city should secure a power site at Bridge River, 138 miles away, where an operating head of 1,400 ft. could be obtained, and, with storage facilities, 500,000 H.P. could be developed. The cost of the development would be \$45 per H.P. at the power house, and at Vancouver \$70-90, depending on the energy delivered. This development could supply a large portion of the province, and is said to be considerably less costly than those proposed for Winnipeg.

A company is erecting a large plant at Shawinigan Falls, Quebec, for the purpose of manufacturing carbonyl and other abrasives. A contract has been made with an electric power company to supply 20,000 H.P. to the new enterprise. It is expected that the construction of the plant will be completed by the end of the year, and that a staff of 300 men will be employed at first.

Colchester.—PROPOSED NEW STATION.—The Electricity Committee has under consideration a scheme for erecting and equipping a generating station on the river; the existing works would be converted into a main distribution sub-station.

Continental.—SPAIN.—In discussing the future of the electro-chemical and electro-metallurgical industries in Spain, *La Energia Electrica* concludes that the principal Spanish rivers and their feeders could supply 1,200,000 H.P. for their development, of which only 400,000 H.P. is at present utilised.

The Sociedad Hidroelectrica del Pindo has been granted the use of the whole of the water power obtainable from the River Dobra, Orvieda Province, for utilisation for industrial purposes.

Greasbro'.—PROVISIONAL ORDER.—The U.D.C. has decided to make an application to the B. of T. for a Provisional Order to authorise the supply of electricity for public and private purposes within the urban district.

Hereford.—ELECTRICITY PRICES.—The Electricity Committee has recommended that, with the exception of reverting to the previous daylight schedule of prices, plus the advances, it will be unnecessary to raise the prices of electricity further. The Finance and General Purposes Committee had recommended increased charges to all classes of consumers.

Harrogate.—The T.C. is endeavouring to get permission from the military authorities to keep all the public electric lights in operation during the coming winter.

Boiler By-Product Plant.—The Electricity Committee has recommended the Council to make application to the L.G.B. for sanction to borrow £1,710 for the installation of a by-product steam boiler plant, in accordance with the designs and specifications of the borough electrical engineer.

India.—ELECTRIC POWER IN COLLIERIES.—The collieries of India, and especially those in Bengal, have, during the past few years, been gradually adopting electricity as a motive power in place of steam. Companies owning a number of collieries have recently effected an economy by installing units at a central station and distributing electricity to the various collieries.—*Colliery Guardian*.

Leeds.—PROPOSED LOAN.—Application has been made by the Electricity Committee to the L.G.B. for powers to borrow a sum of £25,000 for mains extensions, and also a similar amount for the erection and equipment of sub-stations.

London.—MARYLEBONE.—The general manager of the electricity supply department reports that the output of electricity for the four weeks ended July 26th last was 878,150 units, as compared with 836,900 units during the corresponding period of 1916.

Manchester.—ELECTRIC COOKING AND HEATING APPLIANCES.—In the current year's estimates of the Corporation's Sanitary Committee, £250 is provided to cover the expenditure of the Air Pollution Advisory Board for chemical analysis and research work in connection with electricity, gas, and coal cooking, and heating appliances. The Committee reported that an application had been made to the Committee of the Privy Council for Scientific and Industrial Research for a grant in aid of the work, and that a reply had been received stating that the Privy Council had promised the sum of £150, subject to certain conditions.

Marsden.—The U.D.C. has considered a letter from the Yorkshire Electric Power Co. on the lighting question, and a special meeting is to be convened to discuss the matter with the company.

Middleton.—BULK SUPPLY.—The Corporation has had under consideration the report of the electrical engineer on the proposal to convert the electricity works into a transformer and distribution station, to deal with a bulk supply of electricity from Manchester, stating that under the proposed arrangement an increased output of 70 per cent. above the capacity of the present plant could be immediately provided to meet the future demands, and an estimated saving in wages, maintenance cost, and repairs, &c., of over £900 per annum could be effected, whilst the saving in the amount of coal consumed in the generation of the electricity at Manchester, as compared with Middleton, would be 1,500 tons per annum. The town clerk has been instructed to communicate with the Coal Controller on the matter.

New Zealand.—The revenue of the Auckland Corporation electricity department for last year was £60,326, and the gross profit was £34,033. In his annual report, the city electrical engineer states that there was an increase of 10 per cent. in the output as compared with the previous year, which would have been much greater if conditions had been normal and materials available.—*Auckland Weekly News*.

Perth.—PRICE INCREASE.—The Corporation Gas and Electricity Committee has agreed to recommend an increase in the gas rate, and an all-round increase of 40 per cent. on the electricity rates.

Peterborough.—PRICE INCREASE.—The T.C. has decided to further increase the price of electricity, as from September 30th, by 10 per cent., making a total additional charge on the pre-war rates of 20 per cent., and to notify the Electric Traction Co. that the rates paid for current are to be revised three months hence.

Sheffield.—Arrangements have been made for the transfer to Sheffield of 28,000 kW. of plant which is to be installed in the emergency power house at Blackburn Meadows, and the general manager has been authorised to place contracts for the necessary machinery, boilers, and works, at a total estimated cost of £560,000. This includes plant, &c., already ordered. Mains are to be extended at an estimated cost of £2,092.

Sunderland.—The T.C. has decided against the recommendation of the Electricity Committee that the services of the borough electrical engineer should be temporarily lent to the B. of T. Coal Mines Department.

The T.C. has decided that no services for the supply of electricity be laid unless the consumer first provides a priority certificate of a sufficiently high category to enable the Electricity Department to purchase the material required for the work.

Tasmania.—According to the *Melbourne Age*, the Lake Margaret hydro-electric plant is to be extended by the Mount Lyell Co., so as to make available 8,000 H.P. additional to the present installation, at a cost of about £70,000, the aggregate expenditure in this connection being approximately £230,000. At the request of the Government, the Mount Lyell Co. has investigated a scheme for generating electricity on the King River. The results indicate that it appears "economically feasible" to install a 30,000-H.P. plant. Additional power from the Lake Margaret installation will, in the first instance, be used for the electrolytic production of speller.

Whitworth.—The Council has been in communication with the Rochdale Tramways Committee, with a view to obtaining electricity from the overhead wires for street lighting purposes, and has been informed that the scheme would be impracticable, as the voltage in the wires varied considerably, and at times was very low.

TRAMWAY AND RAILWAY NOTES.

Australia.—The Brighton (Vic.) Council has decided to apply for an Order in Council authorising the construction of electric tramways in its territory.

According to the *Melbourne Argus*, the net profit of the Melbourne Tramways Board for the first year's operating of the cable tramway system will be about £350,000. Last year, under the Melbourne Tramway Co.'s management, the revenue from traffic was £805,000; this year the total earnings will be, approximately, £841,000, and with earned interest and income from other sources £857,000. Though the income of the Tramway Board will be considerably more than was received by the Tramway Co., its expenditure will be heavier, as wages, fuel, &c., have considerably increased, and the law costs, consequent on the arbitration proceedings over the purchase of the Melbourne Tramway Co.'s cars and other equipment, will mean additional expenditure. The Tramway Co. last year paid £312,000 in dividends, and transferred £97,858 to reserve, &c. The Board will probably be able, with an extra income of approximately £35,000 for the year, to meet the increased cost of labour and materials and show a net profit of about £350,000; these accumulated profits will be invested until such time as Parliament directs what shall be done with them.

Bradford.—TRAFFIC RECEIPTS.—In the week ended August 14th, the receipts on the Corporation tramways were £7,653, an increase of £299 on the corresponding week of last year. For the 126 days of the current year the income has been £137,631, an increase of £12,620 on the corresponding period (127 days) of last year, whilst last year's figure was an increase of £270 over 1915.

Continental.—SPAIN.—The installation of mechanical communication between Coruna and Santiago has been mooted for over 20 years, and now active steps are being taken to realise a scheme. A company has been formed to construct an electric tramway to link the two cities, the funds being provided by prominent individuals in both the provinces in which the cities are situated.

A company is in course of formation for the construction of an electric tramway in the Asturias, the Diputación and Municipalities of Oviedo, Noreña, and Pola de Siero having agreed to make a yearly subvention of 70,000 pesetas for 10 years.

Doncaster.—The Corporation tramway receipts for the four days of the Bank Holiday period totalled £761, as against a total of £439 last year. The Bank Holiday Monday figure was exceeded by the Saturday total of £286, which was a record day in takings.

Leeds.—The tramway receipts for the week ended August 14th were £10,719, an increase of £21 over those of the corresponding period of last year. The passengers carried were 2,320,000, an increase of 35,000. The receipts for the 18 weeks of the current financial year have been £197,913, an increase of £20,414 over the corresponding period of last year.

WOMEN INSPECTORS.—The threatened trouble on the city tramways, owing to the appointment of six female inspectors, has been settled. The female inspectors are to be retained, but the Tramways Committee undertakes to appoint as future inspectors, former employes who return from the Army but are unfit for drivers, if they are suitable for the work, or other male employes. In any case, the appointments are but a war-time measure.

Manchester.—TRAFFIC CONGESTION SCHEME.—The Special Committee of the Corporation, which has been considering the question of traffic congestion in the central area, has prepared a scheme which will be submitted to the City Council at the September meeting; the scheme provides for the laying of two new tramway tracks to ease the severe congestion in Piccadilly, London Road, and Oxford Street, provision of tramway terminals, and the purchase of property, &c., estimated to cost between £1,000,000 and £1,500,000.

MANCHESTER AND SALFORD AUGUST HOLIDAY TRAFFIC.—The three days' receipts of the Manchester Corporation tramways were £10,921, against £9,763 for the corresponding period in 1916 and £8,503 in 1915. The 1917 daily figures were:—Saturday, £4,106; Sunday, £2,189; and Monday, £4,335; while Salford's tramway receipts for the same period amounted to £5,313, against £3,051 in 1916.

Newport (Mon.).—The Light Railway Commissioners have submitted to the B. of T. for confirmation an order made by them for the construction of a light railway.

New Zealand.—The Wellington City Council has decided, owing to the shortage of labour, to adopt a scheme for the curtailment of the tramway services, and to impose a minimum fare of 3d.—*Auckland Weekly News*.

Sheffield.—The Overhead Line Superintendent (Mr. S. W. A. Sturman) is to act on a Committee of Overhead Line Engineers, which is to consider the question of standardisation of overhead line materials. The Committee has been appointed by the Municipal Tramways Association. The general manager has disposed of five sets of second-hand magnetic brake fittings, taken off cars purchased from the London County Council, to the Rotherham Corporation Tramways, at £10 per set.

The Corporation Tramways Committee has considered the question of wages to be paid to women engaged as labourers in the car repair shops at the Queen's Road works, and authorised the payment of the same rate per hour—viz., 6½d.—as is paid to the men, plus the amount of war allowance paid to the women of 7s. per week.

TELEGRAPH AND TELEPHONE NOTES.

Australia.—On June 23rd, Mr. Justice Powers made known his award in the plaint of the Commonwealth General Division Telephone Officers' Association against the Public Service Commissioner and others. The proposed award is that the rates of pay shall be:—Telephonists, first year, £51; second, £72; third, £90; fourth, £102; fifth, £114; sixth, £126, with a further sum of £6 a year to all who have acted as telephonists for six years or more, and are employed in central exchanges in capital cities to do trunk-line work. Telephonists of 21 years and over shall be paid a minimum of £110. Monitors, first year, £150; second, £156; third, £162; fourth, £168; fifth, £174. Supervisors, first year, £180; second, £186; third, £192; fourth, £196. Telephonists at work in any central city exchange between 10 a.m. and 6 p.m. shall not be required to work for any time exceeding 3½ hours without a break of 10 minutes, or a break for meal, or exceeding 2½ hours if they are required to stand continuously at their work. All work performed in excess of the roster hours of duty in any one week shall be deemed overtime, and paid for at the rate of time and a-half. For duty on Sundays, officers shall be allowed a day off in the next week, and half a day's pay shall be paid at the rate of time and a-half. For duty on holidays, officers shall be paid at the rate of double time, but not double time in addition to the ordinary pay for holidays. The award will not come into operation until the expiration of 30 days after it has been laid before the Commonwealth Parliament.—*Sydney Morning Herald*.

Fleetwood.—At Fleetwood Petty Sessions, on August 9th, G. Kearsley, E. Banks, L. Eaves and F. Stanton were summoned for damaging telegraph insulators by throwing stones. Kearsley was fined £5. Banks £1. Eaves £1, and Stanton 5s.

CONTRACTS OPEN AND CLOSED.

OPEN.

Australia.—MELBOURNE.—October 10th. Department of the Navy. Pumping plant and equipment for the Commonwealth Naval Dockyard, Cockatoo Island, Sydney. Specifications from the Director of Navy Contracts, Melbourne.

Keighley.—August 21st. B. of G. Electric fittings and accessories for lighting the main block at the infirmary. Mr. S. Green, Clerk to the Guardians.

Kettering.—August 28th. Electricity Department. Supplying and laying 751 yards of lead-covered cable, with three-core pilot; feeder pillar, dividing boxes, switchboard instruments and stoneware troughing. See "Official Notices" to-day.

London.—BERMONDSEY.—Sept. 7th. B.C. 500-KW. rotary converter. See "Official Notices" August 3rd.

H.M. OFFICE OF WORKS.—August 20th. 400 miles of bell wire. See "Official Notices" August 10th.

Manchester.—August 18th. Supply, &c., of two electrically-driven turbo-pumps with automatic control and switch-gears, &c., for the Waterworks Committee. The Secretary, Water Department, Town Hall.

Portsmouth.—August 28th. Tramways Committee. Six months' supply of engine-room stores, insulating material, &c. See "Official Notices" August 10th.

Rathmines.—August 29th. U.D.C. 500 tons of coal for the electricity works. Particulars from the Electricity Department.

CLOSED.

Heywood.—T.C. Supply of 300 tons of coal: Mr. John Chadwick.

Peterborough.—T.C. Coal for the electricity works: Fairweather & Son, £1 1s. 7d. per ton.

Sheffield.—The T.C. has accepted the tender of Dewhurst's Engineering Co., Ltd., for the supply and delivery of 500 steel boiler tubes, also the tender of the Stirling Boiler Co. for a similar quantity of boiler tubes. Items covering transformers of 2,500 and 5,000 K.V.A. capacity respectively are to be added to the schedule in the contract with the British Electric Transformer Co., Ltd., for the supply of transformers, accepted on August 1st, 1916.

NOTES.

Thoughtlessness in Power Plants.—The thoughtless man in the power plant is the type that opens the valve on the wrong boiler and traps a fellow employé inside in a cloud of sizzling steam, who blows down the boilers with the blow-off connection open to a dead boiler with men working inside, who unthinkingly closes the wrong switch or grabs hold of a live high-voltage circuit, or numerous other things that could be mentioned. He is thoughtless because he is so busy thinking about what he did yesterday or what he expects to do to-morrow, or puzzling his brains about problems foreign to his work, that he has no time to keep his mind on what he is doing, and as a result jeopardises the lives of his fellow workers and the equipment under his care.

Not long ago several painters were painting the ceiling and walls of a large power house. At this particular time they were working above the switchboard. To keep the board and wiring from being spattered with paint, they had draped a large piece of canvas over the board and busses. About this time a friend dropped in to visit the chief, who had also just come in. He gave one glance at the canvas over the switchboard, and then asked the chief what would happen if one of the circuit-breakers should open on a heavy short-circuit. The chief saw the point, and started to draw the switchboard operator's attention to the dangerous condition, when the thing happened.

The system was 600-volt direct-current, and the circuit-breakers were mounted at the top of the board. The old canvas, soaked with paint, oil, benzine, &c., was hung on the top of the board and draped down over the front, probably not being over two inches from the carbon contacts of the breakers. It seems only an instant after the breaker opened before the canvas was a mass of flames. The smoke and fumes blinded the men, who were working directly above, so they were unable to do anything to save themselves, and to add to the situation, one of them dropped a small iron bar, which went end first through the canvas and fell across the bus-bars. There was a flash and a roar as the circuit-breakers for the machines blew out and shut the whole system down. The men, terror-stricken, jumped to the floor. Two of them were seriously injured, one having both legs broken and another an arm broken in two places besides several ribs; the rest escaped with minor injuries. The switchboard operator had allowed the painters to cover up the board according to their own discretion, and had paid little or no attention to how they did it, because he was busy laying out a wiring diagram for a friend's garage.

The absent-minded man has no business in the modern power plant, and if he is unable to take enough interest in his work to keep his mind on what he is doing, he had better look for a less exacting vocation, where the results of his mistakes are not of much consequence.—E. W. MILLER, in *Power*.

Electric Announcer at Dutch Auctions.—The Office of the United States Commercial Attaché at the Hague reports that at the regular trade auctions, held in the Netherlands, instead of having an auctioneer call for bids, there is a large dial, provided with an index hand. The face of the dial is marked with prices increasing in clockwise fashion. The hand is set at a price above that which the goods offered will probably bring, then is slowly moved to lower and lower figures until some trader indicates his willingness to buy. Electric push-buttons are connected with the dial, which the traders press when a price satisfactory to them is shown by the dial. As the trader presses his button his number appears on the face of the dial, and the lot of goods is sold to him at the price indicated by the index hand. There is no noise or confusion, and the auctions are finished in a remarkably short space of time.—*Journal of the R. S. A.*

Trade with Italy.—The following inquiries for agencies for United Kingdom firms from persons and firms in Italy, some of whom formerly represented German and Austrian firms, have been received at the British Chamber of Commerce for Italy, 7, Via Carlo Felice, Genoa. The inquirers are desirous of negotiating for agencies now, irrespective of whether United Kingdom firms are able to give deliveries at present. All communications regarding the inquiries should be sent to the Secretary of the Chamber, as above, quoting the reference numbers:—

An Italian firm at Bari wishes to represent manufacturers of motors, machinery, and tools for agricultural, electrical, and building purposes (1,401).

A firm of engineers at Genoa would represent firm manufacturing

or exporting electrical materials, steel, tools, general machinery, and engineering goods; also chemicals (1,404).

An engineer, who is manager of a mining company, is prepared to take up the representation of manufacturers of industrial machinery in general, particularly for shipbuilding (1,406).

A Bologna agent (British subject) wishes to obtain agencies for manufacturers or merchants who are interested in trade with Italy (1,407).—*Board of Trade Journal*.

German Electrical Plant Failure at Sydney.—We read in the *Sydney Morning Herald* that on June 15th, at Sydney, the Lord Mayor gave an explanation regarding the use of German electric light machinery by the City Council. He said that the machinery, which was supplied under a German contract, was giving only 80 per cent. of the power anticipated. The City Council had retained a sum of between £1,000 and £5,000 owing to the fact that the machinery had not been successful. Immediately the order for the duplicate set was cancelled the Council took steps to make a contract with a British firm for supplying a set, and this machinery was now running. The Lord Mayor added:—"There is no machinery lying in bond or in any place in Australia of German origin, or of German manufacture, for which the City Council has paid, and has not taken delivery. Secondly, there is no machinery of German origin or manufacture, intended for the Sydney Council, in bond in Sydney or any other place in Australia for which the City Council has not paid; and thirdly, so far as is known, there is no machinery of German or any other origin or manufacture for disposal in Sydney, or in any other place in Australia, which could be used by the City Council in increasing its output."

According to the *Sydney Daily Telegraph*, it had been alleged that German machinery was available in bond, and might be obtained by the City Council with a view to increasing the output and retaining the services of the men who were recently discharged.

Ald. Meagher said that a contract was entered into in the year 1913 for a 5,000-KW. turbo-alternator to be made in Germany, the amount quoted being several thousand pounds less than any other tender, British or American, besides which the plant was the most economical in fuel. In the light of subsequent events it appeared, however, to have been a factor in the dumping process carried out by Germany, as, about the time named, contracts in Sydney, Melbourne, Shanghai, and South Africa were simply swamped by German machinery, tendered for at cut prices.

The turbo-alternator referred to was put to work in April, 1914. For a few weeks it was highly successful and extra economical in operation, and on the strength of the experience acquired a duplicate set was ordered from the same people. Some few weeks after ordering the duplicate set the original set broke down deplorably, incidentally causing the extinction of all the lights in the city.

The contractors were advised by cable, and arrangements made immediately for supplying replacement parts, which had not arrived when war was declared. On the declaration of war the order for the duplicate plant was immediately cancelled. Later on certain replacement parts arrived. Unfortunately, on opening up the machinery, some two or three weeks after, it was found that the moving parts were touching the fixed parts, and there was a narrow escape of another breakdown similar to the original one occurring. The result is, declares the Lord Mayor, this machinery is only giving 80 per cent. of the power anticipated.

Foreign Trade.—THE JULY FIGURES.—The official returns of imports and exports during last month contain the following electrical and machinery figures:—

IMPORTS.	July, 1917.	Inc. or dec.	7 months, 1917. Inc. or dec.
Electrical goods ...	99,968	- 28,010	- 139,782
Machinery ...	654,942	- 29,351	- 477,633
EXPORTS.			
Electrical goods ...	246,932	- 103,035	- 493,263
Machinery ...	1,913,086	+ 152,032	+ 1,006,570

Trade with Canada.—Mr. C. Hamilton Wickes, His Majesty's Trade Commissioner in the Dominion of Canada and Newfoundland, gives some hints to traders with that Dominion in the report dealing with the trade of Canada for 1916, just issued. He states that in the course of a recent visit to the Western Provinces he was impressed by the prevalent desire among business men for improved commercial relations with the United Kingdom, and for a larger trade in British goods. In appointing agents to represent them in Canada, he says, British firms should investigate thoroughly the standing and reliability of the persons whom they contemplate employing. The assistance of the Department of Commercial Intelligence of the Board of Trade may be invoked in this connection. The majority of Canadian importers in goods, handled directly or indirectly through the retailer, look for credit such as is customarily extended by the established American manufacturers. It is no use for British manufacturers of such goods to insist on "cash against documents," or "before shipment." British shippers should also make themselves familiar with Canadian Customs regulations and tariffs.—*Financial Times*.

Educational.—UNIVERSITY OF LONDON.—UNIVERSITY COLLEGE.—The new session for 1917-18 of the Faculty of Engineering commences on October 1st. In addition to the degree and diploma courses, special courses can be arranged, and post-graduate and research work is provided for. A Goldsmid entrance scholarship (£90) will be competed for in September. See our advertisement pages for particulars.

Industrial Reconstruction.—The Employers' Parliamentary Council has issued a memorandum on industrial reconstruction, in which it deals with the interim report on "Joint Standing Industrial Councils" presented to the Prime Minister by the Sub-Committee on "Relations between Employers and Employed" (reviewed in our issue of July 6th).

The memorandum states that the first point that prominently presents itself in the report is the assumption, or implication, that the Labour Unions represent the whole of the workpeople of the country, which is not the case. It may be true that in certain industries the Unions do, in a large measure, if not fully, represent the workpeople employed therein; but, taking the workpeople throughout the country, the overwhelming majority are not members of Labour Unions. Nationally speaking, therefore, the Unions represent only the minority, and can speak and act only in the name of that section of labour that is organised.

The report does not make note of the privileged position of Labour Unions under the Trade Disputes Act. The Employers' Parliamentary Council submits that freedom and security for industry are impossible until all combinations of capital and labour are subjected to the ordinary law of the land, and conspiracies for "paralysing the country" by means of general strikes and lock-outs are rigorously suppressed. The repeal of the Trade Disputes Act must be regarded as a condition precedent to the establishment of that close co-operation between employers and employed which has now become, more than ever, vitally essential to industrial prosperity.

The Sub-Committee submits proposals for "the formation of Joint Standing Industrial Councils in the several industries, where they do not already exist, composed of representatives of employers and employed," and gives examples of the questions with which the Councils should deal. The memorandum points out that it may be doubted whether any industry is completely and perfectly covered by organisations either of employers or employed; and whether it is possible or practicable to bring within the scheme those industries where no organisation exists, or where the organisation is imperfect. At present the Sub-Committee insists that "the Councils should be composed only of representatives of Trade Unions and Employers' Associations, and that new organisations should be admitted only with the approval of the particular side of the Council of which the organisation would form a part."

When confronted by the questions: "Is it intended that decisions reached by the Councils shall be binding upon the bodies composing them? If so, is such binding effect to be conditional upon the consent of each Employers' Association or Trade Union affected?" the Sub-Committee can only answer that agreements reached by the Councils will "carry with them the same obligation of observance as exists in the case of other agreements between Employers' Associations and Trade Unions." The significance of this will be appreciated by Employers' Associations which have had experience of the "binding character" of such agreements as those referred to. It is idle to suggest that the agreements reached by the Industrial Councils could be of any real or lasting consequence, or be considered as possessing any proper guarantee that their terms would be enforced, unless they were of a legal character with provision for penalties recoverable out of funds reserved to meet liabilities involved. The Sub-Committee suggests that "it may be desirable at some later stage for the State to give the sanction of law to agreements made by the Councils, but the initiative in this direction should come from the Councils." It is certain, says the memorandum, that this aspect of the question will arise immediately the Councils, if established, set to work; and it can be settled only in the practical way mentioned above.

As regards the restoration of Trade Union rules and customs suspended by the war, the Committee insists that "the definite co-operation and acquiescence by both employers and employed must be a condition of any setting aside of these guarantees or undertakings"; may it be assumed that "the lessons of the war" have convinced even the Labour Unionists responsible for the old and fatal policy that the rules and customs referred to can, in the very nature of things, never be restored? There are many indications that warrant this assumption; and if it can be made a matter of mutual agreement between Employers' Associations and the Labour Unions, the outlook for British industry will be full of hope and promise. If not—well, says the memorandum, the writing is on the wall, and there can be no mistaking its direful meaning.

Taking the report under review as a whole, the Employers' Parliamentary Council expresses its appreciation of the efforts made by the Sub-Committee to propound a solution of the problem by which the country will soon be faced. While many of the recommendations are, in the opinion of the Council, in themselves laudable, and to some extent practicable—as a matter of fact certain of the recommendations are already, and have for long been, in operation in several industries—others are of a nebulous character, suitable more for academic discussion than for practical experiment. The report will, however, serve the useful purpose of presenting the problem of industrial reconstruction on definite lines; and in this respect, says the Council, the recommendations of the Sub-Committee should be studied and digested by those concerned, with a view to a true and lasting solution being found.

Japan's Progress in the Electrical Industry.—Referring to his article in our last issue on Japan's progress in the electrical industry, Mr. Malcolm Chalmers points out that the Japanese returns for May, which have just come to hand, confirm his remarks as to this year's exports, particularly in the case of electric lamps. The exports of these lamps in the month of May numbered 702,107, valued at about £13,000, bringing the total for the year to date up to nearly 5 million lamps, valued at £97,000.

Fatalities.—An inquest was held on August 10th, at the Hensworth Workhouse, on the body of Walter Hodge, aged 55, who was killed whilst at work at the Hodroyd Colliery, Brierley, on August 8th. He went to work, as usual, in the sub-station, through which run live wires conveying current at 10,000 volts from the Yorkshire Power Co.'s system to the colliery works, and about 20 minutes later he was found by the electrician, Charles Lewis, lying dead under the landing, the ironwork of which he had started to paint.—*Leeds Mercury*.

Eric Grayson, a St. Helens boy, aged 10 years, was last week killed by shock in the glass bottle works of Messrs. Cannington and Shaw, St. Helens; it was stated at the inquest that he had no right in the works. Verdict: Death from misadventure.

A verdict of "Accidental death" was returned at the adjourned inquest on Samuel Cowsill (23), electrical wireman, of Lower Broughton, who died as the result of burns sustained whilst at work, as mentioned in our last issue.

At an inquest at Wallsend on two boys, 8 and 6 years of age, it was stated that the boys were found with their heads against a live rail, in which position they had been lying all night. A verdict to the effect that the boys were killed by shock while trespassing on the railway was returned.

Forth and Clyde Ship Canal.—In the *Times Trade Supplement* for August, the proposal of the Government to proceed with a scheme for constructing a ship canal between the Forth and the Clyde is discussed. It is stated that the distance by the most direct route would be 30 miles, and no locks would be needed except the sea-gates at each end. The purposes to be served by the proposed canal would be primarily of a strategic rather than commercial nature, the bottom width being 148 ft. and the depth 40 ft.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W.

Orders for the week, by Lieut.-Colonel C. B. Clay, V.D., commanding:—

Officer for the Week.—Second Lieut. A. Ullmann.

Nest for Duty.—Platoon-Commander C. Campbell.

Monday, August 20th.—Technical instruction (searchlight) for No. 3 Company, Right Half Company, at Regency Street. Drill, No. 3 Company, Left Half Company. Signalling Class. Recruits' Drill, 6.30.

Tuesday, August 21st.—Lecture, 6.30. Physical drill and bayonet fighting, 7.30.

Wednesday, August 22nd.—Drill and elementary bridge construction for No. 1 Company, Left Half Company.

Thursday, August 23rd.—Drill and elementary bridge construction for No. 2 Company, Left Half Company. Ambulance Class.

Friday, August 24th.—Technical instruction (searchlight) for No. 3 Company, Left Half Company, at Regency Street. Drill, No. 3 Company, Right Half Company. Signalling Class. Recruits' Drill, 6.30.

Saturday, August 25th.—Commandant's Parade for Route March and Drill. Parade Putney Bridge Station, 2.45 p.m. Uniform.

(By order) MACLEOD YEARSLEY.

Electroculture.—Messrs. Harry W. Cox & Co., Ltd., of 159, Great Portland Street, W., have recently reprinted, in pamphlet form, the article on H.T. discharge apparatus and its application to electrocultural operations, which appeared in our issue of July 6th last. The pamphlet contains many useful hints to those who are studying this subject, and can be obtained by applying to Messrs. Cox.

Appointments Vacant.—Engineering staff for ordnance depôts, aerodromes, and military camps in the Southern Command; armature winder for the Keighley Electricity Department; shift engineer (50s.), shift driver (35s.) for the R.E., Wyke Valley district. See our advertisement pages to-day.

South African Institution of Engineers.—The following gentlemen have been elected officers for the ensuing year, the election of president being unavoidably deferred:—Vice-presidents, Messrs. E. G. Izod and C. D. Leslie; hon. treasurer, Mr. Edward Goffe.—*South African Mining Journal*.

New Insulation Material.—According to the *National Tidende* (Copenhagen) of July 21st, a Danish chemist has invented a process by which fish offal may be made to yield not only oil, but also a solid substance named "Corimite," which is specially suitable for electrical insulation. A company, capitalised at 70,000 kroner, has been formed to work the process, and production is expected to begin during the present year.—*Board of Trade Journal*.

Electricity for Cooking.—A Manchester correspondent writes that a Special Sub-Committee of the Engineers' Club, Albert Square, Manchester, having gone into the question whether gas or electricity should be installed for cooking purposes in the club kitchen, has recommended the adoption of electricity, and that a range, made by the Carron Co., will shortly be placed in position. It is stated that before deciding upon electric cooking the Sub-Committee inspected a similar apparatus in the works' kitchen at Messrs. Haworth's cotton mill, Salford, where the results are reported to be completely satisfactory, both as regards cost and quality of the cooking.

Dilution of Labour.—In the House of Commons, on Wednesday, in Committee on the Munitions of War Bill, Mr. Churchill announced that the scheme for the dilution of labour in private works must be dropped, in order to enable the Bill to pass before the adjournment. The leaving certificate would be abolished, subject to certain safeguards, including the requirement of a week's notice, and provision to prevent men from leaving munitions for private work. The amendments were welcomed generally, and new clauses having been agreed to, the Bill was read a third time.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—On the recommendation of the Public Works and Tramways Committee, the Burton T.C. has approved of an increase of £25 a year in the salary of the tramway manager, Mr. A. B. SLATER.

The Portsmouth Tramways Committee recommends that the salary of Mr. W. R. SPAVEN, general manager, be increased from £500 a year to £550 forthwith, and to £600 in a year's time; and that the salary of Mr. V. G. LIRONI, the resident engineer, be increased from £400 to £450 now, and to £500 in a year's time.

The Hereford Electricity Committee has recommended the payment of 100 guineas as an honorarium to Mr. KEIR, city electrical engineer, for the additional work he has had thrown upon him in consequence of extensions to the generating plant, &c., which have been carried out under his supervision. The Committee also recommends that the salary of Mr. G. H. WATSON, assistant electrical engineer, be increased from £156 to £203 a year.

At the annual meeting of the South African Institution of Engineers, Lieut.-Colonel DOBSON, D.S.O., was presented with the Institution's gold medal for the 1915-16 session.

Mr. F. BAILEY, of Bolton, has been appointed assistant station superintendent at Salford at a commencing salary of £200 per annum.

Mr. A. BOOTHROYD, of Huddersfield, has been appointed manager of the Holmfirth District Council's electricity undertaking.

Referring to the note in our issue of August 3rd with regard to an award for improvements in soldering irons, we are informed by Mr. J. WILKINSON, tramways electrical engineer, that the inventor was not, as stated, a member of the Hull tramway staff.

The Stockport T.C. has granted £200 to the electrical engineer for services rendered in connection with the extensions to the electricity works.

Mr. E. JORDAN, of the South Lancashire Tramways Co., was on Wednesday last presented by the engine-room staff with a wristlet watch, on the occasion of his leaving the company to join H.M. Forces. Mr. E. H. EDWARDS, the general manager, made the presentation.

General.—Mr. C. CLARE ATCHISON, who was until recently the manager of the Rochdale Corporation electricity works, retiring owing to ill-health, is now engaged on war work at Bristol, being Dilution Officer there.

The marriage took place at Blackburn last week of Captain GORDON DOUGLAS COE, R.G.A., only son of the Rev. Gordon Coe, Vicar of St. Matthew's, who performed the ceremony, and Miss Lilian Harwood McAdam. Captain Coe was employed at the Blackburn Corporation electricity works at the outbreak of war.

Roll of Honour.—The death at sea is reported of Mechanical Staff-Sergeant ALFRED HENRY MARSHALL, of the Mechanical Transport Section of the A.S.C. He was 29 years of age and a native of Scarborough, but was well known as an electrical engineer and motor engineer in York and Newcastle, where, though not in business on his own account, he had charge of the working staffs of large undertakings. Whilst in charge of a workshop overseas, and a member of the motor ambulance, he invented and constructed a single-wheel stretcher carrier for use in the narrow trenches. The conveyance was adopted by the military authorities. He was invalided home in April, 1916, and again in January of this year, and after a period as supervisor of a workshop he sailed for the Eastern front in April.

Private F. CLOUGHTON, Essex Regiment, who has died of wounds received in action, was with Messrs. Siemens.

Private L. HARDING, King's Liverpool Regiment, one of three soldier brothers, has been killed in action in France. He joined the Army on the outbreak of war, and before enlisting was employed by Messrs. Siemens Bros. Dynamo Works, Ltd.

Company-Sergeant-Major J. MEARY, East Lancs. Regiment, who was with the Salford Corporation tramways, has been awarded the D.C.M. and the Military Medal. At the Town Hall, last Friday, the Mayor, in pinning the medals on the sergeant-major's breast, remarked that it was the first occasion that he had had the honour of attaching a dual award to a Salford soldier.

Lance-Corporal W. HOLLIDAY, Manchester Regiment, killed by a shell, was formerly employed by the British Westinghouse Co., Ltd.

Bombardier B. CLARKE, R.F.A., killed in action, was an electrical engineer with the Carbonic Gas Co., Manchester.

Private R. AMBROSE, King's Liverpool Regiment, died of wounds, was employed by Messrs. I. Frankenburg & Sons, Ltd., cable manufacturers.

Sapper J. SUTTON, R.E. (Signallers) is in hospital from the effects of gas poisoning. He was electrician to the Derwent Valley Water Board, Bamford.

Gunner G. WILSON, R.G.A., a former Burnley tramcar driver, has been mortally injured in France.

Private W. CLARE, West Yorkshire Regiment, killed in action, was formerly on the staff of the Halifax Corporation tramways.

Private E. NORBURY, Northumberland Fusiliers, who has fallen in action, was on the staff of the Manchester Corporation tramways.

Lieutenant W. A. BOISSIER, Royal Marine Artillery, formerly in the Derby Corporation electricity department, has fallen in action. He was a son of the Rev. F. S. Boissier, Vicar of Denby, and enlisted whilst in business for himself as an electrical engineer.

Private H. S. FITCHETT, Northants Regiment, reported missing since the battle for the Dunes in Belgium, was formerly on the staff of the Northampton Tramway Co.

Sergeant G. ADAMS, R.F.A., who was prior to the war engaged at the Rugby works of the B.T.H. Co., has been awarded the D.C.M. for bravery in action in Mesopotamia.

Signaller J. B. SPENCER, Royal Warwickshire Regiment, killed in action, joined the regiment last September from the staff of the B.T.H. Co. at Rugby, where he acted as Assistant Scentmaster.

Bombardier A. COODE, Rugby Howitzer Battery, who enlisted whilst an engineer with Messrs. Willans & Robinson, of Rugby, has been severely wounded in France.

Major R. C. MATHER, son of Mr. Colin Mather, Wrenwood, Hilton Lane, Prestwich, Manchester, is in hospital for the second time, suffering from shell-shock. He was previously wounded in August last year. Major Mather is connected with the well-known engineering firm of Mather & Platt, Ltd., Park Works, Manchester.

Private T. EVANS, K.O.Y.L.I., who was an employé of the Yorkshire (W.D.) Electric Tramways Co., is reported to have died from gas poisoning.

Private A. MARTIN, who was employed in the Glasgow tramways department, has been killed in action.

Lance-Corporal J. SANDS, Border Regiment, killed by a sniper whilst on patrol duty, was before enlistment employed by Messrs. Charles Macintosh & Co., Ltd., electric wire and cable makers, Manchester.

Lance-Corporal T. WALLWORK, Loyal North Lancashire Regiment, who has died of wounds, had been previously awarded the Military Medal for conspicuous bravery. Prior to enlisting he was employed by Messrs. Eckstein, Heap and Co., Ltd., electrical engineers and manufacturers, Manchester.

Will.—According to the *Times*, the late Mr. JOHN HENRY TUCKER, electrical fittings manufacturer, Birmingham, left £230,760, of which £161,552 was net personalty.

NEW COMPANIES REGISTERED.

Harris Plating Works, Ltd. (148,189).—Private company. Registered August 10th. Capital, £8,000 in £1 shares. To take over the business of electro-platers and polishers carried on at 222-8, Goswell Road, and 2, President Street, London, as the Harris Plating Works, also to carry on business of tube makers, japanners, enamellers, electricians, &c. The subscribers (each with one share) are: E. W. Harris, 224, Goswell Road, E.C.; electro-plater; J. A. Watts, 75, Billiter Buildings, E.C., engineer. Permanent directors: E. W. Harris and J. A. Watts (chairman). Registered office: 2, President Street, Goswell Road, E.C.

High-Speed Machinery Co., Ltd. (148,199).—Private company. Registered August 10th. Capital, £2,500 in £1 shares. Mechanical, electrical, sanitary, hydraulic, motor, gas, water, telegraph, and telephone engineers, machinists, &c. The subscribers (each with one share) are: J. P. Annacker, Springfields, Powys Lane, Palmer's Green, N., engineer; F. B. Spear, Hazlewood, Fairview Road, Sutton, sales manager; B. Strachan, Fairport, Hillcroome Road, Sutton, merchant. The first directors are: Joseph P. Annacker, Karl Johann Almfelt, Francis B. Spear, Balfour Strachan, and Howard W. Whitworth (all permanent subject to holding 250 shares each). Solicitors: Chamberlayne, Hacking & Co., 45, Parliament Street, S.W.

Marconi International Code Co., Ltd. (148,204).—Private company. Registered August 10th. Capital, £5,000 in £1 shares. To take over from the Wireless Press, Ltd., all inventions, patents, and rights acquired by that company, or to which that company is entitled, under various agreements recited in an agreement between this company and the Wireless Press, Ltd., to compile, print, publish, and deal in codes, newspapers, magazines, and books, &c. The subscribers (each with one share) are: W. W. Bradfield, Marconi House, Strand, W.C., electrical engineer; H. W. Allen, 51, Braxted Park, Streatham Common, S.W., chartered secretary. The first directors are: Godfrey C. Isaacs, Captain H. Kiall Sankey, Chas. V. Daly, Wm. W. Bradfield, and Hy. W. Allen. Qualification, one share. Remuneration, as fixed by the company. Registered office: Marconi House, Strand, W.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Enterprise Manufacturing Co., Ltd.—Mortgage debenture dated August 3rd, 1917, to secure £500, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: A. P. Grange, Litchford, Warrington.

White, Jacoby & Co., Ltd.—Particulars of £1,500 debenture created March 29th, 1917, filed pursuant to Section 83 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £630. Property charged: The company's real and personal property, including uncalled capital.

Europe & Azores Telegraph Co., Ltd. (39,452).—Capital £200,000 in £10 shares. Return dated July 18th, 1917. All shares taken up £55,080 paid; £144,920 considered as paid. Mortgages and charges: Nil.

CITY NOTES.

**Kalgoorlie
Electric Tram-
ways, Ltd.**

The report of the directors for the year 1916 states that the gross receipts for the year amounted to £31,703, against £33,526 for the previous year, whilst the net profits earned, before charging depreciation, were £1,121, against £7,205. There had been a considerable amount of labour agitation in Kalgoorlie during the year and several strikes had taken place. The decrease of £1,823 was largely accounted for by the falling-off in the workmen's traffic to and from the mines. The company's agreement with its employees under the arbitration award given in 1913 expired during the year. In July the Tramways Employees' Association presented a new log of wages and working conditions which the company could not see its way to accept. The matter was referred to the Arbitration Court. During the year the cars travelled 581,085 car miles, as against 593,434 car miles in the year 1915, and carried 2,052,685 passengers, as against 2,192,135 in the year 1915. The earnings per car mile in 1916 were 12.98d., as against 13.52d. in 1915, with an expense of 10.27d. per car mile, as against 9.93d. in 1915. The expenses per cent. of earnings in 1916 were 79.14 per cent., as against 73.44 per cent. in 1915. The number of units consumed in 1916 was 680,785 (£7,801), as against 692,935 (£7,940) for the year 1915. The "A" debenture stock had been further reduced by the sum of £700 during the year under review, and the amount of stock outstanding at the date of the accounts was £47,300.

At the meeting on August 9th Mr. OLIVER WETHERED presided, and stated that the period had been one of difficulty and anxiety; the mines—on which the prosperity of Kalgoorlie necessarily depended—were passing through a very trying time. In 1916 there were 1,331 less men employed on the mines than the year before, and this meant a loss of about £4,000 a week in wages alone throughout the district. There were 1,121 less men employed in 1915 than in 1914. As in most other labour centres, the men at Kalgoorlie were demanding higher wages and improved conditions of working, with threats of strikes if their demands were not acceded to. The Judge of the Federal Arbitration Court had stated that a company's falling revenue, or its financial position, would not be taken into consideration by him when arriving at what he considered a fair rate of wages to be paid to its employees. Unlike other businesses, it was not possible for them to call on the public to share part of the extra expenses put upon the company, and, although the cost of every article used in the running and upkeep of the tramway might be doubled or trebled, the fares must remain the same, and the cars must run according to schedule. The Transcontinental Railway had been delayed in construction owing to the shortage of freight and the difficulty of obtaining rails; but the latest information from the office of the Commonwealth Government was that it would be completed next month (September). Its completion might favourably affect the situation, but some good discovery of gold in the district would do far more. Meanwhile they were doing their best to reduce costs to the lowest figure through their loyal and capable representatives. The report and accounts were adopted unanimously.—*Financial News*.

**Marconi's
Wireless
Telegraph
Co., Ltd.**

MR. GODFREY ISAACS presided at the meeting of this company on August 9th, in the absence of Senatore Marconi. He said that capital account had undergone no change during the year. The general reserve, with the additional amount which was being placed to the credit of this account, was now represented by the round sum of one million pounds sterling; it had been built up entirely within the last five years. The cash at bankers and in hand at the end of the year showed a very substantial reduction, which was accounted for largely by the great increase of sundry debtors, debit balances, and expenditure on foreign developments which arose from the normal conditions of their business. The investments showed little change. The company had that day invested in 5 per cent. war loan the sum of £200,000. The shares in associated companies and patents showed a small increase both in the balance sheet and in their par value. The latter figure was now represented by £2,487,450. Turning to the profit and loss account, the balance of contracts, sales, and trading account was less than that of the preceding year, as likewise was the balance of the net profit, but it must be borne in mind that during the year 1915 they had some large contracts of an exceptional nature to carry out. Last year they had done considerable business with the Admiralty, and nothing could have been more agreeable than the relations between the company and that department; the high officials with whom they had had to deal at the Admiralty had told him how deeply they were indebted to the company for its consistently admirable and prompt work on their behalf. The relationship between the Admiralty and the company had continued to be equally agreeable to the company, and he had every reason to believe it had been at least equally satisfactory to the Admiralty. The Marconi International Marine Communication Co., Ltd., had shown a very substantial development, and its progress this year was even greater than it was last. They regarded that business as a very sound industrial investment which was not likely to

return less than 15 per cent. per annum, and they had every reason to hope to see an improvement even upon that. These very satisfactory results were due simply to increased volume of business, and not to increased charges. The Russian company had continued to do a very large business, and had paid a dividend for 1916 at the rate of 17 per cent., but ever since the outbreak of war the rate of exchange had been very much against this country, and it had, therefore, been quite impossible to bring home very large sums of money which had been accumulated in Russian roubles unless they were prepared to face a very substantial loss. They had, however, written off from their profit and loss account whatever sum was represented by loss at the end of each year, as though they had brought their money home. The rate of interest on money ruling in Russia had been very low indeed; the opportunities for development of manufacturing businesses were never better. They therefore adopted a policy of investing their money in other factories closely allied with their own business. These businesses were being conducted largely by those who were responsible for the very able and successful management of their Russian company, and were proving very profitable investments. They would have no difficulty in realising upon very advantageous terms if they wished to do so. Their view, however, was that factories in Russia would have even better prospects after the war, and there was, therefore, every advantage in continuing to leave their money where it was for the present. The French company had declared an increased dividend for the past year both on the ordinary shares and upon the founders' shares, and continued to do a very satisfactory and progressive business. The Compagnie Universelle de Telegraphie et de Telephonie sans Fil, the shares of which were acquired by this company in furtherance of its programme prior to the war, was about to be transformed. The American company showed improvement in 1916, but, of course, continued to be handicapped very seriously in consequence of their Transatlantic stations being unable to work owing to the stations on this side being required for war purposes. The principal revenue of the American company was expected from its Transatlantic service, and very considerable expenditure was made upon the stations for that purpose. The whole of this money had been idle since the outbreak of war. The consequence was that, instead of very substantial revenue being obtained from this source, a yearly loss had resulted. Owing to the United States entering the war the Transatlantic stations and all the other American stations had passed temporarily into the hands of the American Government. Fair compensation would be paid, and negotiations were being actively carried on with a view to settling the terms. The same applied to the Transpacific service, which had been started and which was being successfully conducted. The immense number of orders which had been placed with the company by the United States Government should result in a very satisfactory year's work indeed, notwithstanding the closing of their telegraph services. The company had been very much occupied for some time past in the conduct of legal proceedings against infringers of their patents, and the results had been highly satisfactory. The most recent action was one in respect of the De Forest Valve Patents, which the Court held to be a complete infringement of the Fleming Patent, which was the property of the company. The Canadian company had had to contend with the abnormal conditions created by the war. However, their accounts would show an improvement over the preceding year. The Compania Nacional de Telegrafia sin Hilos, of Madrid, in which the Spanish and General Wireless Trust Co. were so largely interested, was making much more satisfactory progress. The Belgian company's business continued to develop very satisfactorily, but as they were unable to have any communication with their head office, it was impossible for them finally to close their accounts. Referring to the Locker-Lampson case and a circular which had been forwarded to the shareholders, he said that at every annual meeting subsequent to 1912 he had been prevented from saying anything about the business which Mr. Marconi and he carried out in America, inasmuch as the action had been commenced and the matter was *sub judice*. This was the first year that he had been free to speak. A circular of an extremely damaging nature had been sent to 12,000 shareholders in all parts of the world. That circular must be answered. Mr. Isaacs proceeded to recount the circumstances in which, in order to carry through the reconstruction of the American company, at the request of Mr. Marconi he made himself personally responsible for £500,000 of new capital, while the English company guaranteed the remainder of the £1,100,000 required. He detailed the subsequent history of the dealings in the shares, the excitement in the market owing to the loss of the *Titanic*, which created a great demand for American Marconi shares, the outbreak of war, which prevented the inauguration of the Transatlantic service when it was on the point of starting, the inquiry into the company's contract with the Postmaster-General for a chain of Imperial wireless stations, and the litigation, lasting three and a half years, which was brought against the directors and others, and eventually withdrawn. The circular issued by Mr. J. W. Hamilton was fully dealt with, Mr. Isaacs declaring that he had never received one penny profit from the transactions that were criticised, and that the company had never gone into the market to offer shares in any of its

subsidiary companies. He also read a letter from Mr. Marconi stating that it was impossible to over-value the services which Mr. Isaacs had rendered to the company, and that if the shareholders, contrary to his expectations, supported the threatened renewal of personal attacks upon him (Mr. Isaacs) and the other directors, he would terminate his connection with the company by resigning from the board. Neither Mr. Marconi nor he could tolerate this sort of persecution for ever, and he would ask them, therefore, to pass a resolution expressing their complete confidence in the chairman and managing director and the board, and with the way in which they had conducted the affairs of the company in the past and were conducting them to-day. The Transatlantic service had been closed down, in no sense on account of any fault on the part of anybody or any complaint of any kind whatsoever, but solely because the exigencies of war to-day had demanded it. The company would, of course, be entitled to full compensation from the Government. Since the issue of the report and accounts negotiations had been opened with a view to settling two important items under the four heads of claims upon the Government: (1) for remuneration and compensation in respect of the use of the company's high power stations since the beginning of the war, the staffing and management of those stations, and other services in connection therewith; (2) their claim in respect of the withdrawal of the Post Office from the contract for the Imperial chain of stations. Notwithstanding all their efforts, they were not able until the previous night to get anything in the nature of a definite suggestion out of the Post Office. As regarded the Imperial contract, there had been many negotiations, and on several occasions they had, by request, postponed any public move in the Courts with a view to further negotiations for a settlement. Negotiations, however, were now proceeding afresh, and they appeared to be nearer to a settlement than ever before. Should they again be disappointed, they had determined at a very early date to convene an extraordinary general meeting. With regard to the claim upon the War Office, this dealt with a question of patent rights, and having regard to the immense work which the War Office had to perform in these times, it would not be fair to complain of that department finding itself unable to deal with their claim until after the war. With regard to the Admiralty, they had been given the assurance that everything possible had been done and would be done to expedite the matter. He felt sure that all those shareholders who had been interested in the company for many years would warmly approve the appointment of Mr. Allen and Mr. Bradfield to the board. He moved the following resolution:—"That the report of the directors submitted, together with the annexed statement of the company's accounts at December 31st, 1916, duly audited, be received, approved, and adopted."

Mr. HENRY S. SAUNDERS seconded the resolution, and said that the work done by Mr. Godfrey Isaacs in America had received the full support of the directors, who had congratulated him on the wonderful service which he rendered to the company when he was over there.

Mr. J. W. HAMILTON, who said he represented by proxy over 300 shareholders, then addressed the meeting amid considerable interruption. He moved an amendment to the effect that the adoption of the report be postponed, and that the meeting be adjourned in order to allow a committee of investigation to be appointed, with authority to inquire into the charges which had been made in the Locker-Lampson action, and into the conduct of the company's affairs.

The amendment, however, was not seconded, and the report and accounts were unanimously adopted.

Mr. REGINALD WOODWARD moved a resolution expressing the complete confidence of the shareholders in the chairman, the managing director, and the board, and the manner in which they had conducted the affairs of the company in the past and were conducting them at the present time.

This was seconded by Mr. HORACE BOOT, and a shareholder having suggested as an addendum "that the greetings of the shareholders present be sent to Mr. Marconi," the proposition, with this addition, was carried with acclamation.

The CHAIRMAN next moved the declaration of final dividends of 5 per cent. on the cumulative participating preference shares and 10 per cent. on the ordinary shares.

Mr. SAMUEL GEOGHEGAN seconded the motion, which was unanimously agreed to.

The retiring directors and auditors were re-elected.

An extraordinary general meeting was then held, at which the CHAIRMAN proposed the following resolution:—"That the articles of association of the company be altered as follows:—By substituting the following article for article 77, that is to say—77. The remuneration of the directors shall, as from January 1st, 1917, be at the rate of £4,000 per annum, and in addition thereto in any year in which the dividend or dividends and/or bonus declared and paid for such year on the ordinary shares of the company shall be in excess of £7 per cent. on the nominal value of such shares, the remuneration of the directors shall be increased by the sum of £200 in respect of each 1 per cent. paid by way of dividend and/or bonus on the ordinary shares in excess of £7 per cent. as aforesaid. The remuneration of the directors shall be divided between the directors in such proportions as they may from time to time determine."

Captain H. RIAL SANKEY seconded the resolution, which was passed unanimously, and a vote of thanks to the chairman closed the proceedings.—*Financial Times*.

Oldham, Ashton & Hyde Electric Tramway.—Interim dividend of 5 per cent. per annum (6d. per share) on the ordinary shares, as last year.

W. T. Henley's Telegraph Works Co., Ltd.—Interim dividend on the preference shares at the rate of $4\frac{1}{2}$ per cent. per annum, less income-tax, and on the ordinary shares at the rate of 10 per cent. per annum, less income-tax, for the half-year ending June 30th.

San Luis (Mexico) Tramways Co.—The accounts for the year ended March 31st show that, after providing for loan interest, &c., the debit balance of £10,137 brought forward was increased to £14,514.—*Financial Times*.

South Metropolitan Electric Light & Power Co., Ltd.—The transfer register and register of members of this company will be closed from August 18th to the 31st, 1917 (both days inclusive), for the preparation of warrants for dividends payable 31st inst., for the half-year ended June 30th, 1917, on the 7 per cent. cumulative first preference shares and the 6 per cent. cumulative second preference shares.

Lancashire Dynamo & Motor Co., Ltd.—Dividend of $2\frac{1}{2}$ per cent., free of tax, making $12\frac{1}{2}$ per cent. for the year, on the ordinary shares. The same rate was paid for 1915.

Brompton & Kensington Electricity Supply Co., Ltd.—Interim dividend for the half-year to June 30th on the ordinary shares at the rate of 8 per cent. per annum (less tax), the same as a year ago.—*Financial Times*.

STOCKS AND SHARES.

TUESDAY EVENING.

MATERIAL improvement has taken place in securities of the Mexican industrial companies. This is the main feature of the week in the foreign groups. Upon what ground it is based there seems to be some doubt felt in the Stock Exchange. The news from the country, most of it emanating from United States sources, is certainly less unfavourable; but it is only in this negative sense that the improvement can be expressed, so far as definite intelligence is available.

However, the bonds of the Mexico Tramways and of the Mexican Light and Power Companies have both risen several points. The shares have participated, and such offshoots as Pachuca 5 per cent. bonds are better at 27 $\frac{1}{2}$, while Monterey 5 per cent. debenture stock is changing hands fairly freely on the higher basis of 20 $\frac{1}{2}$. The strength is shared by Mexican Government, railway, and oil issues, from which it would appear that there is something more in the buying than the news warrants; and further information is awaited with keen curiosity.

Brazilians have been moving on a different plane, and Brazil Traction eased off to 49, although Rio Tramway bonds hold their prices steadily. Rio Firsts are 87, and the Seconds 77 $\frac{1}{2}$. San Paulo Firsts have been done lately at 89, while the 5 per cent. consolidated debenture stock last changed hands at 76. In the 5 per cent. debentures of the Southern Electric Tramways of Buenos Aires, bargains were marked early this month at 95 and a little over.

Victoria Falls & Power ordinary shares are unusually active, considering the time of year, at 19s. 6d.; and the preference have risen to 23s. 6d. Those happy folk who bought the ordinary shares at a few shillings each are in the fortunate dilemma of not knowing whether to take their profit or not. The shares look a very possible 10 per cent. investment, but, on the other hand, the profit is alluring. The preference do not seem to be over-valued, and there has been a little buying of the 5 $\frac{1}{2}$ per cent. second mortgage debentures because of their receipt of interest tax free, although it must be remembered that the issue is repayable at 103.

The Marconi meeting had a stimulating effect upon the price of the shares, and from 27 the price rose briskly to 32, this including the recently-declared dividend. The preference are a little better at 23, but it cannot be concealed that there is a certain amount of disappointment at the Government award being still left in the air. The cable market as a whole is good. Eastern ordinary at 144 $\frac{1}{2}$ is a point up; so are Indo-Europeans at 53 $\frac{1}{2}$. Chinas rose to 14 $\frac{1}{2}$. Anglo-American preferred at 98 is a shade harder. The only change in the telephone share list is a rise of $\frac{1}{2}$ in Orientals to 24. Telephone of Egypt debenture is up a point to 78.

The railway market is doing little more than mark time. No changes have occurred amongst the electrical stocks. Central London guaranteed assented preferred ordinary has been bought at 60 $\frac{1}{2}$ since we last wrote. The assented deferred stands at 60 $\frac{1}{2}$, while the non-assented is about 30. The assented ordinary stock, quoted in our price lists, is 61 $\frac{1}{2}$, the non-assented 41 $\frac{1}{2}$. A small amount of East London stock changed hands the other day between 31 and 34, and London Electric Railway £10 shares were offered and declined to £2

per share. The company's 4 per cent. debenture stock marked 69 early this week, the return at this price being £5 16s. per cent. on the money, which is a decidedly better yield than is offered by the debenture stocks of most other Home Railway companies. Underground Income bonds strengthened to 82.

Electricity supply shares are quietly firm. Westminster have risen to 6, pursuing their steady improvement; and City of London ordinary have gained $\frac{1}{2}$ at 12 $\frac{1}{2}$. Charing Cross hold their rise at 33; and Metropolitan advanced to 23. Amongst the manufacturing shares, British Insulated at 30s. 7 $\frac{1}{2}$ d. are $\frac{1}{32}$ up. British Westinghouse preference put on 2s. 6d., the debenture gained 2 at 67 $\frac{1}{2}$. Edison Swan 4 per cent. debenture is a point to the good, and India-Rubber shares jumped 7s. 6d. to 13 $\frac{1}{2}$ for the reason that the shares pay very handsomely, apart altogether from the fact that the dividends are distributed at present free of income-tax.

A correspondent writes to ask whether we consider advisable the sale of Chelsea Electric and an exchange purchase of Marconi shares. This is one of the conundrums which can only be answered by the statement that Chelseas are investment shares, while in Marconis there lie very considerable elements of speculation. Relatively, Marconis are much higher, because they are £1 shares standing at 3 $\frac{1}{2}$, whereas Chelseas, which are £5 shares, are about 2 $\frac{1}{2}$. Chelseas before the war were 4 $\frac{1}{2}$, while Marconis stood at 1 15/16.

The rubber market shows a good deal of strength, and this week the shares of nearly 40 different companies are marked ex dividend. The price of the raw material is steady at half-a-crown per lb. Iron and steel descriptions advance where they move at all; and in the base-metal section there is slightly more animation amongst tin shares.

Errors in Thermometry.—In a recent number of *La Nature*, the eminent French scientist, M. Le Chatelier, has an article on the measurement of high temperatures. He gives a brief description of the various methods at present in use, and devotes some space to a consideration of the thermo-electric (Le Chatelier) type of instrument. He mentions the necessity of the frequent regraduation of the thermocouples, which alter in use. Further, the sensitivity of the galvanometers used varies with time, either from loss of magnetism in the permanent magnets, or by changes in the verticality of the instrument. The moving coils, which are generally heavy, rarely have their centre of gravity exactly in line with the points of suspension. The result is a disturbing couple, which tends to modify the galvanometer readings. Very often errors are discovered, the exact cause of which it is difficult to trace. The most frequent trouble is that the wires of the couple come adrift when they are simply twisted together instead of soldered, or they break when heated in a reducing atmosphere. If contact ceases entirely, the trouble is easily discovered, but very often the wires continue to touch and allow the current to pass, but with a reduction in strength on account of the additional contact resistance, and the readings are therefore falsified without the observer being aware of the exact trouble. A cause of error, frequent in factories, arises through fine iron powder settling on the soft iron core, and damping the action of the moving coil slightly. This source of error is even more difficult of discovery than those mentioned above. Finally, in laboratory tests, when the couple wires are not immersed sufficiently in the substance to be tested, the thermal conductance of the wires cools the thermojunction and affects the readings.

National Union of Manufacturers.—The articles of association of the National Union of Manufacturers, which were completed in June last, show that the Union is the successor of the British Manufacturers' Association, 1915. Mr. George Terrell, M.P., is chairman of the Union, which includes among its objects the promotion of the trade, commerce, and manufactures of British industries, and the home, colonial, and foreign trades of the United Kingdom.

The Union also desires to effect co-operation and mutual help among British manufacturers and producers of all kinds of goods and commodities, and to encourage free and unrestricted communication between masters and workmen with a view to the establishment of amicable arrangements and relations, between them.—*The Times*.

DIRECT-CURRENT MACHINES: SOME NOTES ON ESTIMATING.

By "W. A. E. M."

WHEN no actual recent cost is available of an exactly identical machine, the estimating of a new size of generator or motor may entail a considerable expenditure of time, and often the costs that are at hand are not in sufficient detail

of labour or material, an up-to-date cost may be obtained. The value of the price-adjusting coefficient—let us call this k_a —providing for the advances in the markets will be found to be :—

$$1 + .0001 [x y + (100 - x) . z],$$

where x = per cent. labour cost of total cost, y = per cent. advance on labour, z = per cent. advance on material.

The adjoining graphs (fig. 1) show values of percentage advance on total cost per cwt. of material for the principal and heaviest items of material used in the machine, viz., copper and iron (or steel), according to the price advances per lb. and cwt. respectively.

The graphs (fig. 2) show values for k_a for various combinations of x , y , and z .

FIG. 1.

to lend themselves conveniently to manipulation, or admit of very close adjustments or *pro ratas* being made.

A handy *pro rata* rule is shown below for obtaining the approximate cost of a new machine, given the cost totals for labour and materials of the basis machine and dimensions of the armature core of the latter, and of the one to be estimated :—

$$\text{Cost of labour} = \sqrt{D^3} \times k_l,$$

$$\text{Cost of material} = \sqrt{L} \times D^2 \times k_m,$$

where D = diameter of core (external) in inches, L = length of core (between end plates) in inches, and k_l and k_m = constants for (cost $\div \sqrt{D^3}$), and (cost $\div \sqrt{L} \times D^2$) for labour and material; these will vary according to the particular maker.

The writer has found that quite good results can be obtained in predetermining costs in this way, especially where the basis machine or machines taken for the values of k do not deviate very considerably from the new machines in the core dimensions; and, on occasions when it has been found convenient, or considered desirable, to use the more lengthy and closer methods, the application of the approximate rule shown has often proved a very useful check.

By the use of a further adjusting constant, which, from an intelligent analysis of machine costs, can be approximately deduced for correcting the price for increases in cost

MULTIPLEXING IN CABLE TELEGRAPHY.

IN the *Journal of the Franklin Institute* for May, Brigadier-General George O. Squier, Chief Signal Officer, U.S. Army, states that the use of alternating currents in cable telegraphy offers the great advantage that multiplexing is made possible. Among the many schemes which may be utilised, the method of using separate cables for sending and receiving, transmitting several messages on one cable and receiving a corresponding number on another, seems to offer the best solution of the problem where the volume of traffic warrants it. Such an arrangement eliminates the artificial cable, which is an indispensable element in duplexing, and at the same time gets rid of all the troubles incidental to the accurate balancing of the duplex bridge.

The method proposed is shown schematically in the two accompanying figures (p. 166). In fig. 1 an arrangement is shown for transmitting three messages simultaneously on one cable. We have here three local transmitting circuits coupled to the cable, the frequency of each transmitter being different from that of any other, say, 6, 8, and 10 cycles. In each local transmitting circuit, two looped circuits are included, which are separately tuned to the frequencies of the other two transmitters, offering thereby a high impedance to the current flow of these frequencies, and thus preventing the transfer of current from one transmitting circuit to the others

FIG. 2.

To further check any transfer of current from one local circuit to another, the intermediate circuits 1, 2, and 3 are introduced, through which E.M.F.'s of opposite phase to that induced by way of cable transformers are induced, thus balancing out any residual effect from one circuit on another.

In fig. 2 a receiving terminal of a cable is shown in which three circuits are used for the reception of three messages simul-

aneously. Each receiving circuit is coupled to the cable through an intermediate circuit. In each intermediate circuit, two loop circuits are included, which are separately tuned to the frequencies of the signals which are to be excluded from that particular receiver, each receiver responding accordingly only to a signal of one predetermined frequency and excluding the others. If desired, loop circuits may also be introduced in the receiver circuits, and thus further increase the selectivity.

In the arrangement described above, the disturbing effects of a local transmitter on the receiver, which are always present to a

Transmitting terminal.

FIG. 1.

Receiving terminal.

FIG. 2.

greater or less degree in duplexing, are entirely eliminated, and, as a consequence, detectors and amplifiers of very much greater sensitiveness may be employed.

For purposes of illustration, three transmitters and three receivers are shown, so that two cables could handle three messages both ways, but obviously the method outlined above is not limited to this number.

PERMANENT MAGNETS.*

By F. C. KELLEY.

By means of the hysteresis loop we are able to determine the two most important facts that we ought to know about steel for permanent magnets, namely, the remanent magnetism and coercive force: the height of the point where the curve cuts the vertical axis, and the breadth of the loop on either side of the zero point. The coercive force is the more important. Though the magnetic permeability of a specimen is inversely proportional to its carbon content, the amount of permanent magnetism retained is directly proportional to the carbon content.

The hard constituent called hardenite, which may be a solid solution of carbon in iron, or possibly a subcarbide of iron, is of the same percentage as pearlite, and is formed during any cooling that is so rapid that the particular pearlite structure has no time to form. This constituent appears to be the most important in magnets.

The shape and dimensions of a magnet have a great effect upon its retentivity, due to the fact that the poles of every magnet exercise a self-demagnetising influence on the body of the magnet.

The demagnetising effect in the case of slit rings has been shown to be nearly proportional to the width of the slit, or gap in the magnetic circuit. If the ring is provided with large pole pieces and the gap is narrow, the demagnetising coefficient may be greatly reduced. The amount of remanent magnetism increases regularly with the dimension ratio, that is, the ratio of the length to the diameter of the bars.

A laminated magnet has been found to be no more powerful than a solid magnet of equal weight and length.

Since the coercive force of magnets depends upon the way they are hardened, it is essential for magnets which are to have the greatest coercive force that they be quenched at a temperature above that at which they recalesce, and quenched quickly.

Magnetic material which has had previous working should be annealed slowly, and then quenched just a little above the point of recalescence. Mme. Curie tried experiments on the effect of quenching carbon steels of 0.06-1.20 per cent. C, and found that 770 deg. C. was the best temperature for quenching. If quenched at 975 deg. C. the remanence and coercive force both fell in value. She also found that the best magnet material, after hardening, if reheated to 905 deg., degenerated. By quenching first a little above and then a little below the point of recalescence, and going through this cycle several times, she found that the material could be improved, and that material which had become poor by over-heating could be repaired.

Barus and Strouhal found that annealing at a temperature which gave a blue tint produced the best results. They also found that for short bars a glass-hard state, produced by heating to a bright red, and quenching in cold water, gave the best results.

The tungsten steels which have proved best for magnets

fall in two groups: (1) Those containing 5 to 7 or 8 per cent. W with about 0.5 per cent. C, and (2) those containing 2½ to 3½ per cent. W with 1 per cent. C. Steels containing from 0.75 to 9.5 per cent. of chromium have high coercive forces; but there seems to be little advantage in adding more than 2½ or 3 per cent. Cr. Cast iron makes good magnets. Campbell, by quenching at 1,000 deg., found values of remanence from 200 to 229, and coercive forces from 48.9 to 52.8.

The method of magnetising bar magnets is to put them inside a long magnetising coil about twice as long as themselves. Short bar magnets may be put between the poles of an electromagnet, as may horse-shoe magnets. The field to which they are subjected should not be less than $H = 250$. Little depends upon the duration of the operation.

Permanent magnets age with time, or lose part of their magnetism. Causes for the decay of magnetism of magnets are mechanical shock, changes of temperature, contact with magnets or iron, and exposure to demagnetising forces. The lapse of time also apparently effects a deterioration. But in all magnets there seems to be a limit to this decay.

Permanent magnets are matured by repeated gentle heating and cooling, protracted gentle heating, repeated subjection to mechanical shock, and partial demagnetisation.

Barus and Strouhal found that by heating a glass-hard magnet in steam for 60 hours, then remagnetising, and steaming again, its remanence was reduced to a constant value. After this treatment it was dropped from a height of 1.5 to 0.5 m. on a wooden block, and it did not change over 0.54 per cent.

Mme. Curie found that heating magnets in steam caused a reduction of both coercive force and remanence, and that reheating to 200 deg. C. was disastrous, for about 50 per cent. of the original total magnetism was lost.

W. Brown found that glass-hard magnets resisted shocks much better than others, and that by prolonged reheating at 60 deg. a constant state was reached with a reduction of from 1 to 3 per cent. in best steels.

Krüse found that materials having the greatest coercive force had the least percentage loss from shock.

To produce permanent magnets which are both constant and powerful, a tungsten steel should be used, having from 5 to 8 per cent. of tungsten and from 0.4 to 6 per cent. carbon. Chromium up to 2 or 2.5 per cent. may be present, but the presence of manganese, titanium, copper, sulphur, and phosphorus should be avoided. For bar magnets the dimension ratio should be as large as possible. For horse-shoe magnets the gap between the poles should be short as possible, and the polar areas as large as possible.

The forging of magnet material should be done with little working of the material, and at a low temperature. After forging it should be normalised by raising to 900 deg. C., lowered to 750 deg. for a time, and then cooled off. To harden the magnets, they should be heated to 950 deg. C. for five minutes only, then lowered to 700 deg. C., and quenched in brine or oil at 20 deg. C. Some tungsten steels are better if quenched between 770 and 850 deg. C.

There is no advantage in tempering tungsten steel. Magnets of carbon steel of 20 diameters may be tempered to a straw tint, and those of 40 diameters to a blue tint. Any letting down below a straw tint impairs their power to resist decay and usage.

Magnets should be matured by boiling or steaming for 10-12 hours, or by heating them to 60 deg. C. for 20 or more hours. There is some advantage in letting them cool several times during the process.

The magnet should be magnetised by an electromagnet, or, if a bar magnet, by a magnetising coil, using the highest degree of magnetisation possible. There is some advantage in reversing the magnetism a few times, but in the final magnetisation the current should be turned off slowly to zero. There is an advantage in giving the magnet a slight mechanical shock. Some magnets which are to have extreme constancy are subjected to demagnetising forces.

Cr, Mn, Mo, and W are important additions in the manufacture of steels for permanent magnets, but the presence of a third element is necessary. While carbon is beneficial, highly satisfactory results are to be obtained with Si and vanadium, especially vanadium.

The following table represents some of the best alloys obtained for permanent magnets. The first section shows results obtained before rapping or ageing; the second after rapping:—

Composition.	Before ageing.		After ageing.	
	B (Ret)	in H	B (Ret)	in H
8 Mo, 0.3 V, 0.6 C	11,750	53.7 quenched	5,000	51.2 quenched
5 W, 0.5 C	11,700	59.0	5,200	52.5
5 Cr, 3 Mn, 4 Mo, 1 Si	11,350	55.8 as forged	5,300	61.7 as forged
1 Mn, 10 Mo, 0.5 C	10,750	58.4 quenched	5,400	57.5 quenched
2 Cr, 10 Mo, 0.5 C, 0.3 V	10,500	78.0	6,300	77.2
7 W, 0.3 V, 0.6 C	10,450	39.4 as forged	5,600	81.0
10 Mo, 0.3 V, 0.4 C	10,350	59.8 quenched	—	—
2 Mn, 5 Mo, 0.6 C	—	—	5,500	57.2 as forged
6 Cr, 0.81 Si	—	—	5,300	52.3 quenched
2 Cr, 14 W, 5 Mo, 0.3 V, 0.5 C	—	—	5,000	63.5
10 Mo, 1 V, 0.4 C	—	—	5,000	68.5

The general idea about permanent magnet material is that the harder it can be made the greater its permanence. Comparative tests on materials quenched in water or brine would be expected to show that the harder the piece, the less permeable, the lower its residual induction, and the higher its coercive force, but it is only true with certain steels under restricted conditions.

It is well known that the hardening capacity of steel decreases as its mass increases, yet the larger mass, and hence the softer piece, is magnetically most permanent.

It is well known, too, that the rate of cooling in oil is slower than in water, and does not give as great hardness. Yet experiments on steel, which was quenched both in water and in oil, show relatively soft oil-hardened pieces when compared with water-hardened pieces of the same size to have lower induction, lower residual and higher coercive force than the much harder water-quenched pieces.

Drawing the temper of steel has a very marked effect on the magnetic properties. Hardness may be relieved by drawing the temper, but this gives results directly contrary to those due to retarded quenching rates. That is, the maximum induction and residual magnetism are increased, and the coercive force is lowered. This is true whether the steel owes its original hardness to oil or water hardening, and it is also true that the effect of tempering is more marked on oil-hardened than on water-hardened pieces. That is, the augmented permanence in these alloy steels, due to oil hardening, is unstable, and this fact limits the possible commercial application of oil-hardening of magnets in manufacture.

Boiling in water has only a slight effect upon the magnetic tests, while drawing the temper at 205 deg. C. (400 deg. F.) seriously impairs the magnetic permanence. This is true of both the structural alloys and the commercial magnet alloys. At a drawing temperature of 315 deg. C. (600 deg. F.) the difference between oil and water-tempering is wholly wiped out, and nearly identical tests result.

REVIEWS.

Electrical Engineering Practice. Third Edition. By J. W. MEARES, F.R.A.S., M.Inst.C.E., M.I.E.E. London: E. and F. N. Spon, Ltd. Price 25s. net.

The author, in his preface, states that in re-writing this book for the third edition he intends it to fill the gap between the engineering pocket-books, which give a mass of highly-condensed information, and the specialised works, each dealing with a particular subject in detail. A book of this kind is by no means easy to write, owing to the difficulty of maintaining a due sense of proportion, and of avoiding giving prominence to one particular subject at the expense of others. The author of the book under consideration, while he cannot altogether be said to have escaped this defect, has nevertheless carried out his intention with a large measure of success, and has produced a work which should be a very valuable one, particularly to engineers whose connection with electricity is only secondary. The author's style is exceedingly clear and lucid, and his meaning can always be grasped at a first reading. This circumstance largely atones for the lack of diagrams in many places, which goes far to impair the utility of the work.

The book is divided into three parts, dealing respectively with elementary principles, installation work and domestic applications of electricity, and electrical plant and supplies. The first part is concerned with fundamental principles and elementary facts relating to the supply and applications of electricity, and suffers somewhat from a lack of logical sequence in the arrangement, and also from a lack of diagrams to explain the text. The author makes use of the hydraulic analogy to explain the relationship of electrical magnitudes, and his treatment is clear and convincing, but the corresponding treatment of the more complex magnetic units is poor. A lengthy description of the potentiometer could have been condensed to one quarter the present length if a diagram had been added. All the information given is, however, quite accurate and precise; as an example, in the section on instruments, the difference between "aperiodic" and "dead beat" is explained.

The second part of the book, dealing with wiring and the domestic applications of electricity, is a very good one, and contains a mass of valuable information. Modern interior lighting systems are fully treated, and the information regarding domestic heating apparatus is excellent, although the chapter would have been greatly improved by a more liberal use of illustrations. Installation work is dealt with fully, modern wiring systems and up-to-date methods of switching being described. The author would have done well to have pointed out the waste involved in indiscriminate "looping in," and to have indicated how this can be avoided by the use of modern accessories.

The third part deals with all remaining subjects covered by the title of the book, with varying degrees of thoroughness. The chapter referring to motors, welding plants, and electric furnaces is a good one, although the diagram of a motor starter on page 260 can hardly be said to represent modern practice. A chapter on smaller generating plant and accumulators follows. An interesting, but lengthy, account of systems of charging and tariffs divides this chapter from the remarks on larger plant for public supply. References are given for descriptions of automatic voltage regulators; a brief account of the most important of these would have been valuable. The few lines devoted to the motor converter seem

quite inadequate, considering the importance of this machine. The author has discussed modern tendencies in power-station development at some length, referring, for example, to the recent proposals and experiments in connection with the gasification of coal before burning under boilers, and the recovery of by-products. There is no reference in this chapter to the remarkable efficiency of the Ljungström turbine in the smaller sizes; and the subject of K.H.T. switchgear can hardly be said to have been touched upon. Excellent chapters follow on the application of water power, electric traction, electric vehicles, and electricity in mines. Transmission schemes are next dealt with, together with the subject of underground cables. The treatment of the latter subject shows the lack of balance that has been before referred to. While three pages are devoted to an excellent section dealing with up-to-date practice in the manufacture of cables for very high voltages, giving a clear explanation regarding graded insulation and intersheaths, the wider subject of cable-laying systems is dismissed in two pages. A good chapter on specifications and depreciation follows, and the final chapter is devoted to the subject of testing. In many ways this is the least satisfactory in the whole volume. The treatment is generally scanty, while the reference to the induction method of fault localising is so superficial as to be misleading. The same can be said of the paragraph on meter testing, in which one-quarter load is given as the lowest load to which meters should be tested. If this final chapter had received fuller treatment, even at the expense of some of the earlier chapters of more limited interest, it is safe to say that the work would have been considerably improved.

The book contains over 100 tables, and a useful list of these is given at the beginning. Extracts from wiring rules and standard specifications are given in the sections dealing with various aspects of installation and other work. These rules and specifications might well have been reprinted in full as an appendix. The value of the book is considerably enhanced by numerous cross-references and by the provision of an excellent index. The book can be recommended as a valuable work of reference, covering a wide field, and containing an immense amount of useful and up-to-date information.—G. W. S.

The Range of Electric Searchlight Projectors. By JEAN REY. London: Constable & Co., Ltd. Price 12s. 6d. net. (Translated by J. H. Johnson.)

Searchlights play so important a part in the work of our land, sea, and air forces that the appearance of this book is particularly opportune, especially as no treatise has hitherto been available making it possible for artillery officers to calculate the range of searchlights with some approximation to the ease and accuracy with which they calculate the range of their guns or—more generally—making it possible for any user of a searchlight to determine the distance at which the latter will illuminate effectively a stated objective. The problem is not altogether simple, and its solution involves many indeterminate variables (especially those dependent on atmospheric conditions); nevertheless, the author's work represents a material advance in range measurement from the practical point of view.

The study of the range of electric searchlights comprises the determination of luminous flux emitted by the arc; the extent of distribution of this flux as received and reflected by the mirror; the calculation of the amount of light projected at a distance, allowing for the size of apparatus and focal length of mirror. Knowing the amount of light projected at a distance by the searchlight, it is possible to calculate approximately the range of illumination by taking into account the coefficient of atmospheric absorption. It then becomes possible to determine for any given searchlight the probability of being able to illuminate a certain object at a given distance, provided that one knows the average degree of atmospheric transparency for the district.

The author handles the subject along these lines, dealing first, in Chapter I, with determination of the luminous flux emitted by any arc, pointing out the distinction between theoretical and practical results, and giving a number of useful formulæ and data. The theoretical illumination obtained with a specified reflector is next considered. A series of reflectors ranging in diameter from 0.3 to 2 metres is assumed, and the luminous flux corresponding to three different focal lengths is determined in each case, (a) for a series of low voltage arcs, (b) for a series of high voltage arcs. High voltage increases the luminous flux received by a given reflector, but necessitates the use of special carbons, difficult to obtain. In this chapter, again (as, indeed, throughout the book), the author shows clearly the corrections to be applied to theory in order to allow for the conditions of practice, and presents many useful formulæ and experimental data.

The efficiency of an electric searchlight (Chapter III) may be defined as the ratio of luminous flux projected at a distance by the apparatus to the flux emitted by the arc and received by the reflector. The author considers quantitatively each source of loss. A mirror in good condition should reflect 85 per cent. of the light falling upon it. In addition, there are shadow and shutter losses. The total efficiency in small and large searchlights respectively may be 65½ per cent. and 73½ per cent. without flashing shutters, or 51½ per cent. and 67½ per cent. with shutters.

Chapter IV gives data and curves for calculating the practical illumination from searchlights at a standard distance of 1,000 metres, knowing the theoretical illumination and the total efficiency of the searchlight. There seem to be a few misprints on page 44. The influence of current, voltage, and diameter of positive carbon on practical illumination is discussed, and it is shown that high-voltage, heavy-current searchlights have certain intrinsic advantages.

Although, for practical reasons, Mangin reflectors are used to a less extent than formerly, they have important optical advantages, and the author is justified in devoting Chapter V to consideration of the special results obtained with Mangin searchlights.

Having considered all the internal elements which affect the range of a searchlight (viz., power of the arc, diameter of reflector and focal length, efficiency of reflectors and searchlight), the author deals in the second part of the book with the external factors affecting range, viz., transparency of atmosphere, distance at which objective is placed, dimensions and nature of the objective, its colour and the colour of the background; finally, the distance at which the observer is from the searchlight and objective. The effect of transparency acts on the double range between searchlight, objective, and observer. This fact, the influence of form and colour of objective, and the limitations of visual acuity have all an important bearing on the fact that an airman (or working party, &c.) within an enemy beam may be so strongly illuminated as to feel certain that he is discovered whereas he may be absolutely invisible to the enemy observer. Striking instances of this sort are mentioned by the author, and it seems highly important that everyone in our forces should realise that he is not necessarily visible to the enemy although he is under comparatively brilliant illumination (*e.g.*, one and a half times that provided by the full moon at its zenith).

In Chapters VI *et seq.* the author starts from a formula of M. Blondel's for the range of searchlights (apart from visual sharpness). To facilitate the practical application of this formula the conception of "equivalent illumination" is introduced, *i.e.*, the illumination of various objects, under various test conditions, which renders them just visible (or clearly visible, as the case may be) assuming that the coefficient of reflection, diffusion, and physiological effect of contrast is the same for all objects. In other words, instead of attempting the very difficult operation of measuring this coefficient for each class of object, the author eliminates it entirely, and replaces it by empirical "equivalent illuminations." The latter are fictitious values, since they imply that the limit of visibility of the human eye for different illuminated objects corresponds to different quantities of light falling upon the retina. Once the table of equivalent illuminations is determined (and the author gives values for a whole series of land and sea objects), it is possible to calculate for the same objects the ranges under the conditions met in practice. Graphic diagrams are given to facilitate application of the general formula.

The question of atmospheric transparency is discussed at length, and typical data are given. The genesis and use of the graphic diagrams are well explained, and the curve sheets, abacs, and so forth are drawn clearly to large scale on folding plates. The examples and practical problems of ranges given in Chapter VIII should make the reader thoroughly competent to deal with any problem of his own. Throughout the book, data and curves relate to modern methods, appliances and constructions of war, and to climatic conditions in all the principal war zones of Europe on land and sea. Chapters IX and X deal with variation in ranges according to the size of searchlight and atmospheric transparency, and with visual acuity. The book presents in compact form a clear working exposition of the best methods and data at present available for determining the range of searchlights, and does not fail to point out where further data should be accumulated as opportunity arises.

The Orbit of Mercury.—Speaking at the summer meeting at the Hampstead Garden Suburb, last week, Sir Oliver Lodge said he had been working on the variations in the orbit of the planet Mercury. This orbit revolved slowly, and there was a discrepancy known to all the great astronomers. Le Verrier found that it amounted to 13 seconds. It had remained a puzzle, and some had believed that it was due to the proximity of another planet, which could not be seen by us, and which had been named Vulcan.

Sir Oliver Lodge said he believed the discrepancy was explained by the electrical theory of matter. The inertia of a body moving at a high speed was greater than if were at a standstill. Mercury, the fastest planet in the solar system, travelled 30 miles a second. One lb. of matter moving at 30 miles a second, the speed of Mercury, equalled one lb. plus the hundred-millionth part of a lb., and that fraction was not subject to gravity. This was, he thought, the probable cause of the variation of the orbit of Mercury.

ELECTRICAL INTERCONNECTION IN LANCASHIRE AND CHESHIRE.

WE referred in our last issue to the second report recently issued by the Committee for the Interconnection of the Lancashire and Cheshire Electricity Supply Systems, the contents of which were briefly outlined. Further perusal of the report leads us to the conclusion that the proposals are in the main so obviously dictated by commonsense considerations, and so clearly intended to operate with the single aim of providing an ample supply of cheap electricity for industrial purposes, that only minor criticism can be advanced by those who sympathise with the end in view. The Committee is thoroughly representative of the area concerned, and our only regret is that the company representatives, who did not sign the "additional powers" proposals of the Committee, have not more clearly defined their views. The reason for basing local authority representation on the Joint Board, on population, and company representation on capital outlay, is not self-apparent; neither appears to bear such a close relation to the electrical "figure of merit" of a supply authority as, for instance, output sold, which is a general indication either of initiative or favourable conditions. On the basis chosen, the 35 undertakings concerned would be represented by 90 members, including 11 representatives from four companies; as mentioned last week, these would be divided into four District Boards, which would elect a Central Executive of 20 members, two of whom would be special representatives of the Lancashire Power Co., in addition to its possible District Board representation. The Central Executive would have powers to elect a committee of six advisory engineers, one of whom would represent the Lancashire Power Co.

The capital expenditure of the municipal undertakings concerned on power stations, mains, &c., is £7,425,266, of which 43 per cent., or £3,166,274, has been redeemed; the corresponding capital value of the companies immediately concerned in the present proposals (exclusive of goodwill and investments) appears to be £1,021,645, of which only £73,218, or 7 per cent., has been written off. Although these figures have little bearing on the interconnection proposals of the Committee, they are of interest as showing the financial status of the two classes of undertaking in the area.

In passing, it should be emphasised that under the various powers associated with its interconnection proposals, the Committee specifically safeguards the right of appeal of individual authorities

to the proper Government Tribunal, as well as their existing rights as distributors within their statutory areas, and, moreover, lays down the principle of compensation for those authorities who are prejudicially affected by the operation of the scheme. Presumably, the latter contingency may arise if heavy expenditure is incurred on plant for bulk supply, &c., at the request of the Board.

As regards the second portion of the report, dealing with the proposed additional powers to establish and control all future and existing power stations and high-pressure transmission lines, it is pointed out that the 35 undertakings concerned generated 421 million units during the year ended March, 1916, and that in five years' time this output would under normal conditions expand to 1,000 millions, the maximum load increasing during the same period from 138,429 kW. to 300,000 kW., representing an average annual increase of 32,000 kW. This can be met by increasing the capacity of existing stations in some cases, while in others it would be desirable to erect new stations. The Committee states the case for co-ordination of effort at considerable length, finally arriving at the conclusion that the Board should possess the power to erect new stations and to acquire the ownership, control, and operation of all or any power stations, existing and future, and all high-pressure transmission lines. While we do not doubt the validity of these proposals, which would, if carried into effect, extinguish power company business, though leaving the ordinary statutory company no worse off than a corresponding local authority under similar circumstances, their *raison d'être* is not very clear, at any rate, as regards the more immediate future, having regard to the proposed powers of the Board for interconnection purposes, which include "to co-ordinate and *prescribe the running hours of existing stations* and to act in an advisory capacity in regard to all proposals for future extensions of generating plant."

For all practical purposes, the supply authorities and the Board appear to be identical. What is to prevent the Board in its wisdom from deciding that the future generating plant extensions of, say, half-a-dozen adjacent authorities should preferably be carried out jointly by them—under existing legislative powers—and on a site selected by the Board? In effect the same result would be obtained as if the Board proceeded under its "additional powers," with the exception that in the latter case the Board, *i.e.*, the whole of the authorities in the Lancashire and Cheshire scheme, would raise the capital and presumably share in the proceeds, while in the former case, only the authorities directly concerned would be interested financially. In either case, the operation would be controlled by the Board.

The proposals under "interconnection" were, moreover, adopted unanimously, while the "additional powers" have apparently led to a little rift within the lute.

No doubt the Committee has decided that the principle at stake renders the course which it has chosen worth while, although the powers of the Board for interconnection purposes, if we have correctly interpreted them, appear to be ample for the immediate future, and such as would automatically lead up to the proposed "additional powers." However, the Committee has, no doubt, had in mind the probability of some comprehensive effort by private interests to control bulk electricity supply in the future, and the proposals embodied in the Board's additional powers may be justified as indicating an alternative which is much more desirable in the interests of cheap electricity supply.

IN a recent issue of the *Textile Recorder*, an article on "Power Costs. Costs a Vital Factor" discusses the alleged certainty of textile mill

power costing more in the future than in the past, whatever method of obtaining power be adopted, and goes on to point out that the advantages at present possessed by a mill, in which the machinery stands in the books at a low figure, will be reduced materially if fuel costs keep on increasing. The writer briefly urges the necessity of obtaining the best results with whatever method is adopted, though evidently with a leaning towards electric driving, in connection with which he says that "first and foremost we must have cheap current," *i.e.*, in the cotton trade; the price per unit must compare favourably with the cost per horse-power, "then we shall reap to the full the advantages enumerated." These advantages include reduced transmission losses, abolition of smoke, even turning, cheap structures, higher production, &c.

This is all very interesting, but what proportion do power costs bear to the cost of placing manufactured cotton on the market? That such costs are as vital as suggested is unbelievable, bearing in mind the many archaic power installations which have in the past competed, and presumably still compete, with modern steam and electrical installations. The explanation that power plant investments have been written-off in the older installations cannot apply in all cases, yet the older mills survive, despite high power costs. Perhaps we have been woefully misled, but we seem to remember a few years ago the manufacturers' argument that power costs were such an insignificant proportion of the total that the introduction of electric driving with a view to their reduction was not worth while.

This attitude is, indeed, so generally understood, that there is a disposition to avoid the question of costs of electrical driving, which, even if higher, would not materially affect the case for the electrical drive, because the possibility of obtaining from 5 to 10 per cent. greater output, with an improved product thrown in, altogether outweighs any small increase, if such should take place, in power costs. We need not here discuss the reasons for this result; they are well known, and have been proved in practice the world over, though many mill owners are still sceptical.

What we fear our contemporary does not appreciate is that the case for electric driving *with purchased power*, strong as it has been in the past, will be rendered practically impregnable by the disproportionate effect of increasing fuel charges on the "well-established steam boiler and highly-developed mill engine" or the "gas-power plant with by-product recovery apparatus, or the newly-established oil engine" as compared with that on the modern public supply station, with its relatively less costly and more efficient plant, advantages in diversity of demand, and ever-growing output, which tend all along to neutralise increasing fuel costs.

The striking feature of electrical production costs in the past has been their continual decrease, particularly in industrial areas, and despite the gradually increasing cost of fuel in pre-war times; the war has simply accelerated the rate of increase of fuel costs, to such an extent as to more than neutralise, for the time being, the normal reduction of average costs due to expansion of business, introduction of more efficient plant, &c., and as a natural result prices have risen, in many instances, though not necessarily permanently. Given a return to settled conditions, even with fuel at present prices, we see no reason why, with an expanding business and modern methods, production costs should not com-

mence to fall again as in the past, and reach a lower than pre-war level.

Surmise would be turned into certainty given the whole-hearted co-operation of the Lancashire mill owners; indeed, it is with a view to ensuring that an ample supply of cheap electricity shall be available to meet their prospective requirements that the recent proposals of the Committee for the Inter-connection of the Lancashire and Cheshire Electricity Supply Systems have been put forward. It is not stretching the matter too far to say that the best private plant will be at a discount when the schemes for electricity supply on a wholesale scale at present under consideration mature; the North-East Coast may be cited as an example of intensive electrical development, but Lancashire offers even greater opportunities for electricity supply.

Industrial Reconstruction. In our issue of July 6th we gave a cordial welcome to the interim report on "joint standing industrial councils" by the sub-committee on relations between employers and employed, of which Mr. J. H. Whitley is chairman. We are glad to see that the desire of the sub-committee that this report should be discussed without delay has been fulfilled to some extent already. Last week we summarised the views of the Employers' Parliamentary Council, which took the form of friendly criticism of the proposals put forward, and an expression of hope that the recommendations of the Sub-Committee would be of assistance in arriving at a true and lasting solution of the problem of industrial reconstruction; this week we are enabled to reproduce a memorandum of the Executive Council of the Federation of British Industries on the subject, produced in compliance with a request from the Ministry of Labour, which claims to be the first authoritative public pronouncement by employers on this important question. From a perusal of this valuable statement it will be seen that the Federation, which is by far the largest and most representative body of employers in the country, and embraces an extremely wide variety of manufacturing and producing interests, is heartily in accord with the general principles which underlie the recommendations, and that its comments mainly relate to the details of the proposed organisation, the necessity of which is amply emphasised; the Federation is not content with mere criticism, it proceeds to discuss the composition and functions of the respective councils, and submits a plan carrying the scheme a stage further, in that it provides a fourth link in the chain, a "National Industrial Council" consisting of representatives of employers and employed in all industries, and forming a final Court of Appeal to which all questions which could not be settled in the sectional councils would be referred. This proposition appears to us admirably to crystallise and define the fundamental ideas embodied in the conclusions arrived at by the Whitley Committee. At first sight the plan would seem to suggest that the Federation was somewhat obsessed with the idea of settlement of disputes, which appears in the forefront of the "duties" allotted to each class of council, and it must be admitted that in the light of past experience this would unfortunately be one of their most important functions; but an examination of the memorandum itself shows that the Federation regards the provision of facilities for co-operative action as of still greater moment, and agrees that harmonious relations between employers and employed are absolutely essential to the attainment of that efficiency of production upon which our commercial prosperity in the

future will wholly depend. The importance of securing efficient management in every branch of industrial activity, and of giving it free play in development, is also clearly recognised.

It will be observed, on comparing this memorandum with that which we abstracted last week, that while the latter saw many lions in the path, the former courageously faces the admitted difficulties, and cordially endorses the view of the Sub-Committee that the organisation of every trade is a first essential to their solution; at the same time, it is urged that such organisation must be voluntary, and unfettered by Government control in any form.

So far all goes well; but once more the question to which we have previously referred inevitably crops up: how will it be ensured that the agreements drawn up by these Councils, or other organisations, will be loyally carried out? The problem should not prove insoluble; pending its solution, we are glad to see that the movement towards organisation is making such satisfactory progress.

Reform in Education. The views enunciated recently by the Senate of the University of London, taken in conjunction with the report of the Committee appointed by the Treasury to consider the scheme of examination for Class I of the Civil Service, afford good grounds for hoping that the reforms so long demanded, besought, and advocated by our most eminent educational authorities are at last about to attain fulfilment. The memorandum of the Senate is uncompromising; the University of London has long held broad and enlightened views on the question at issue, and in this statement the Senate cuts at the roots of the evils which so long have hampered intellectual progress and development in this country, and have contributed so largely to the inception and the prolongation of the war. Had those in chief authority during the past 10 or 20 years been endowed with a well-organised and adequate training for their posts, instead of the narrow and lop-sided curriculum that was forced upon them, we should either have been spared the horrors of world-war or we should long ago have emerged from it victorious.

The Committee is not so downright in its condemnation of the methods of the past, but nevertheless its conclusions may be accepted as highly satisfactory. We do not wish to see classical studies suppressed, or even subordinated to science; what we claim is that the balance should be held justly, and that a due proportion of time should be spent by every student on the study of the world in which he lives and is to work. The revised scheme places modern languages on an equality with the dead languages, gives prominence to the study of English and general knowledge, includes a *viva voce* examination to test mental activity, and gives due weight to mathematics, science, and (a new subject!) engineering. All this is very good, and we trust that the proposals will be carried into effect without serious modification.

In this connection, we wish to draw attention to a small book, entitled "The Public School System in relation to the coming conflict for national supremacy," by Mr. V. Seymour Bryant—a Master of Arts who recognises that increased attention to science in education is indispensable to the training of the mind, and in this work lays bare the defects of our present system, indicating also the steps required to make it more efficient, so that, as Lord Rayleigh says in the preface, "the next generation of English public school boys will have more to show for their time spent in school than could be claimed for ours."

V.B. CABLE BREAKDOWNS IN THE TROPICS.

By D. M. W. HUTCHISON, B.Sc., M.I.E.E.

THESE few notes are being written in the hope that readers at home and abroad may give their experiences in similar cases to those about to be mentioned.

It is evident that if the cause of these breakdowns can be traced it will be far easier to prescribe a remedy. V.B. cable breakdowns are nearly always put down by the makers to decentralisation of the cores due to overload, but the opinion of those operating these cable systems is by no means unanimous on this point.

The writer has had personal experience of the breakdown of a complete network of V.B. cables, which had ultimately to be replaced entirely, and quite recently there came under his notice a case of breakdown of V.B. shaft cables in a tin mine: both of these cases occurred in the Tropics. Other cases of V.B. cable breakdown have also occurred in the Tropics within the writer's knowledge.

In the first case mentioned, 3-core jute-insulated V.B. cables—mostly .05, .025, .05, but some twice and four times the capacity—were laid solid in bitumen: there can be no doubt in this case that the cables were the best obtainable of their class, and that the laying was done carefully, as the cables were manufactured by a leading firm and laid under the supervision of their own engineer.

The fact remains that within five years of the network being put into commission it was necessary to order new cables, which replaced the original V.B. network two years later: the present cables are lead-covered, paper-insulated, and are giving satisfaction.

In this system there can at first have been no question of overload, although, when faults began to develop, it became necessary to overload parts of the network to continue the supply.

The faults were nearly all of the same type, and occurred in the cable itself: faults in joint-boxes were extremely rare. The fault when dug up was invariably found to be a short-circuit between cores, and there was, as a rule, no leakage to earth: in many cases it was evident that the fault had been developing for weeks, as the cores had almost disappeared, and the bitumen sheathing for several feet on each side of the fault was soft and sticky. A trial length of paper-insulated V.B.-sheathed cable gave better results, but developed trouble at a joint-box.

In the second case mentioned the cables were of the solid V.B. type double-wire-armoured, and supplied pumps in a mine: the cables ran in on the adit level and then passed down a vertical shaft to a depth of about 400 ft., being supported by slings and cleats. The work was supervised by an experienced engineer. Within about three years faults developed of the same nature as indicated above, the cores coming together and short-circuiting: these faults occurred both in the shaft and in the adit level.

In the writer's opinion, V.B. cables are quite unsuitable for tropical countries: taking the F.M.S., where he has had a good deal of experience, there is a regular day temperature in the shade of close on 90° F., and the temperature in the underground workings of a mine may be 110° F. or so. Possibly a good deal of the damage is done in handling the cables: it is, as a rule, impossible to get them in position without exposing them to the heat of the sun, and this may mean a temperature of 160° F., sufficient to soften the bitumen.

There is an idea very prevalent at home that lead-covered cables should be avoided in the Tropics, as there is a difficulty in obtaining skilled labour for jointing: this has been true in the past to a great extent, but has been got over largely by the help of European jointers who have imparted their art to Oriental mechanics.

In the town where the writer resides, plumbed joints are made regularly and successfully by Chinese jointers, trained locally, who also make lead fittings for the purpose.

In the writer's opinion, lead-covered paper-insulated cable takes a lot of beating, and as it can carry a lot more current for the same area of copper than other types without damage, it is especially suitable for mining purposes where it may be necessary on occasions to overload plant and

cables to cope with an emergency. For special positions, such as shafts in a mine where acid water is encountered, a double-wire-armoured cable protected by a bitumen sheath over-all, and with solid strand filling, should meet every requirement and should give no trouble once properly installed. The possibility of the lead parting under the strain of its own weight might be avoided by specially careful manufacture, and by the use of fairly short lengths looped in to horizontal joint-boxes in chambers excavated in the sides of the mine shaft. Cables with varnished cambric insulation, which are used largely in America, might also solve the problem, as this class of insulation is said to be non-hygroscopic and is mechanically strong.

FAULT LOCALISATION BY DROP OF POTENTIAL.

By H. E. BLAKE, A.M.I.E.E.

A PREVIOUS article on "Induction Methods of Fault Localisation" has elicited so many interesting comments and inquiries, that the writer is encouraged to ventilate the subject of drop-of-potential methods in the hope of a similar fruitful result. A comparison of notes by those engaged in the practical work of the distribution of electricity should be of the greatest benefit to the industry.

In utilising the drop-of-potential method, the ideal conditions for success are indicated by the following diagram:—

FIG. 1.

Obtain suitable readings on G by adjusting the resistance

$$\text{Then } x = l \times d_1 c_2 / (d_1 c_2 + d_2 c_1).$$

x = distance of fault from A,
 d_1 = galvo. deflection with S to A } Without altering
 d_2 = " " " S to D } galvo., shunt, or
 c_1 = milliamperes with S to A } variable resist-
 c_2 = " " " S to D } ance.
 l = length A B.

It will be noted that with two sound lines available between the ends of the faulty cable, it is unnecessary to know their length or sectional area, because, with the two-way change-over switch S to D, the drop is measured by G between F and B only, A F and C B automatically becoming extensions of the galvanometer leads. Similarly with S to A, the drop is then measured from A to F only, C B F becoming an extension of the galvanometer lead to C. The result eliminates all errors except those of contact resistance, which can be guarded against by clean connections, and those due to the slight difference in length between the inner and outer conductors of a concentric system, owing to the bridging of the outers, where the cable has been cut for services. The errors entirely eliminated by this method of connection are:—

1. *Due to fault resistance.* This may be high, low, or varying, without vitiating the test. In the case of a steady resistance, either high or low, deliberate readings may be taken on the galvanometer, as the drop is measured before the current passes to earth. In the case of a variable resistance, rapid readings should be taken, three or four times in succession, by means of the change-over switch, thus counteracting the error due to this cause.

2. *Due to the loop at the far end B.* By connecting as shown, no loop need be allowed for, as the measurements are taken on the faulty cable only, the loop merely forming part of the galvanometer leads.

3. Due to the cable connections to the apparatus. By connecting the galvanometer direct to the cable under test, as shown, this error is entirely removed. This constitutes a great advantage for this method over the Murray or Varley loop tests.

These ideal conditions for the use of this test most frequently arise on d.c. three-wire systems, where the negative conductor has developed its habitual fault due to osmosis, and the positive and neutral conductors remain sound; but faults on short lengths of distributor under the worst conditions of shorting may be localised by this method, by laying a length of twin cab-tire-sheathed cable in the gutter to represent the two testing lines.

The numerous adaptations of the drop-of-potential method of fault localisation for the infinite variety of conditions that arise in practice, after the fault has been analysed by megger testing from both ends, would require too long a demonstration. Suffice it to say that when only one sound line is available, the sectional area of lead and return must then, of course, be considered, and the loop at the far end allowed for. The writer has achieved highly-successful results by this method with a Paul Unipivot galvanometer of 50 ohms resistance and a scale range of 50 divisions each side of a central zero. The current to actuate this instrument is so small, that very careful milliampere readings are necessary to obtain an entirely accurate result on short lengths. The battery used was one of 4 volts, 20 ampere-hours, the variable resistance 0 to 2,000 ohms, and the galvanometer shunt resistance $\frac{1}{3}$, $\frac{1}{9}$ and $\frac{1}{27}$ of the instrument. An induction test with a telephone and search-coil should be made after the drop-of-potential test, to check the position of the fault, should it happen to be on a service, as the drop-of-potential test will only show the position accurately if it is on the straight run. A drop-of-potential test, however, saves walking over the whole of a long route with a search-coil.

With reference to variable fault resistances, where time allows of it, the faulty cable should always be broken down to earth before starting the test, in order to avoid this source of error entirely. If the fault resistance varies rapidly, the change-over switch is not quick enough to obtain two galvanometer readings with the same resistance in the whole circuit. In cases where a cable has shorted and sealed itself again (not an uncommon event on H.T. supply, especially where diatrium or similar insulation is used), only the outer conductor should be broken down to earth, as the inner may then be used as one of the sound testing lines. When using high pressure to break down cables to earth, which have re-sealed themselves, the desired result will be obtained more rapidly by raising the pressure gradually through a liquid resistance. If the high pressure is switched on instantaneously, it will merely blow its fuse at the moment it sparks through the insulation, which will re-seal itself again and again.

A breakdown on a feeder is often heralded by preliminary intermittent shorts a day or two before the event. These shorts are usually instantaneous, and it is impossible to localise them to a single feeder area, where no maximum pointers or relays are fixed in connection with the feeder ammeters at the generating station.

The following simple method, which has the important recommendation of economy in these days, will localise the trouble to one area, which can then be inspected and tested. A loop of tissue paper $\frac{1}{16}$ in. wide, in the shape of the upper half of a clamp connection, should be stuck across the scale on the face of each feeder ammeter—say, 30 amperes above maximum load. This will be severed or moved by the swing of the ammeter needle, and the feeder affected will thus be indicated.

With regard to the causes of faults on three-wire v.b. single cables d.c. laid solid in wood troughing, moisture is often first introduced by the pine knots in the cover of the troughing letting out their turpentine under the influence of damp and varying temperature, thus acting as a solvent on the bitumen beneath. There is a considerable deposit of turpentine in a pine knot, which is a hardening of the sap where the tree has branched.

When locating faults on a.c. concentric L.T. systems, the fact must be remembered that this system acts as a condenser, giving a high reading in volts from inner to earth,

with sound insulation. A fault dead to earth, on inner or outer, will bring the volts to zero of the affected winding, when measured to earth, and the volts between the unaffected winding and earth will rise to the same pressure as that between inner and outer. This should be borne in mind, in order to distinguish normal condenser effect from faults. The following results are of interest as an example of what may be expected under working conditions on a network clear of earths, without disconnecting consumers' wiring:—

Size and type of cable.	Insulation.	Length.	Volts.			Remarks.
			I to E.	O to E.	I to O.	
0.1 sq. in. concentric, paper-insulated, lead-covered.	0.5 Ω	1 yards	0	0	210	Drawn in iron pipes to this point.

THE EXAMINATION OF COMMUTATION CONDITIONS IN INTERPOLE MACHINES.

By FREDERICK MURGATROYD, B.Sc. Tech.

THE introduction of interpole machines simplified enormously the practical problems of commutation by establishing a constant brush position. To maintain a constant brush position it is necessary to have a fixed neutral at all loads. This, obviously, may be attained by providing—

- (a) A flux equal in magnitude and opposite in direction to the armature reaction flux.
- (b) A flux strong enough to neutralise the reactance flux existing in the coils undergoing commutation.

Both these functions the interpole is able to perform, with the result that a machine fitted with interpoles has many substantial advantages over the non-interpole machine. The necessary field ampere-turns are lowered, flux densities are reduced, higher peripheral speeds are made possible, brush thicknesses may be increased without excessive circulating currents resulting, higher ratings are made possible for the same frame, and sparkless commutation is obtained much more easily.

It is thus seen that in the running of interpole machines the engineer is primarily concerned with two factors, namely:—

- (a) Maintaining the correct brush position.
- (b) Maintaining the correct interpole field strength.

The object of this article is to discuss the methods by means of which these factors may be correctly ascertained.

Brush Position.—As stated above, the correct brush position for interpole machines is the neutral axis. There are several good methods of ascertaining this neutral position, but by far the best is the "kick" method. This consists in alternately switching the field "on" and "off," and in taking millivoltmeter readings, the ends of the instrument leads being held firmly on successive pairs of commutator segments which are a full pole-pitch apart. The armature must be kept stationary, of course, and all brushes must be lifted. The positions of the segments between which the millivoltmeter reading is zero, are the positions of two adjacent neutral points. A check test should be made by rotating the armature slightly so as to make the relative positions of armature slots and pole pieces different, and the above procedure should be repeated. If the second neutral point is different from that obtained by the first test, the mean of the two determinations should be chosen as the true one. However, if the machine is a generator, it may be more convenient to run it up to speed by means of its motor or prime mover, with brushes lifted and field excited. Then, if the ends of the millivoltmeter leads be placed at various points on the commutator near one of the neutral axes, the ends themselves

being as close together as possible, the point at which the reading on the voltmeter is zero is the true neutral. The neutral point having thus been found, the brushes should be carefully set, so that their centre lines coincide with this neutral axis. The brush spacing should then be checked up, and the brushes rebled to the commutator, if necessary, before starting up.

Commutation.—The actual disposition of current in the brush is a very complicated phenomenon. However, ideal commutation is quite a simple action, and as it is towards this ideal that we are always working, it is perhaps necessary that we should now state what this is. By "straight-line" or "ideal" commutation, we mean that, as any one coil becomes short-circuited by the brush at A (fig. 1), the current in the coil should begin to die away uniformly, until at the midway point B the coil carries no current. The current should then build up uniformly, until at the point C, where the coil becomes open-circuited again, it should be carrying its maximum current as at A, but in the opposite direction. When this condition is not fulfilled, there is an abrupt change of current in the coil when it open-circuits at C, and sparking ensues. Now this ideal commutation cannot be attained if the self-induction of the coil is not adequately compensated for by providing the correct number of extra ampere-turns on the interpole, the result being that the energy stored up in the coil has to be dissipated by a circulating current which passes through the coil and brush, destroying all the conditions necessary for ideal commutation. It may be taken as an axiom that, given good mechanical conditions, sparking in interpole machines is always due to these unbalanced circulating currents, and therefore to an incorrect interpole field strength. It is patent, therefore, that to be able to test for circulating currents is an absolute necessity, and this may easily be done by means of brush-volt curves.

Brush-volt Curves.—The brush-volt curve is a curve showing the variation in contact drop between brush and commutator throughout the brush thickness. It is obtained in the following manner:—Mark along the brush thickness a number of equidistant points as shown in fig. 2. For a $\frac{3}{4}$ -in. brush, $\frac{1}{8}$ -in. divisions are very suitable, and give seven readings. Readings are then taken whilst the machine is

FIG. 1.

FIG. 2.

on load, by connecting a millivoltmeter between the top of the brush and points on the commutator immediately under each of the divisions of the brush in turn. It is very important to agree upon one standard method of connecting up the voltmeter, and the usual practice is to take the readings at the + brush in a motor and the - in a generator, the + of the voltmeter being connected to the brush and the - to the commutator. It is also advisable to standardise the direction of rotation, say, clockwise. The terminal of the + lead of the voltmeter may be a copper hook which is easily attached to, and detached from, the brush flexible. The - lead should terminate in a thick copper wire pointed at the end. The curve is constructed by plotting as ordinates the readings on the voltmeter, and as abscissae the corresponding points along the brush thickness.

Diagnosis of Commutation Conditions from the Brush-volt Curve.—Let us first assume that we have ideal commutation. Although each individual coil whilst shorted by the brush reverses its current from maximum in one direction, through zero, to maximum in the other direction, the current collected by the brush itself is quite constant, and

under a condition of ideal commutation the current density is the same at every point on the contact surface. Thus the contact drop is uniform, and ideal commutation may therefore be represented by the straight line shown in fig. 3a. Circulating currents upset this uniform current density, so that the straight line becomes inclined and curved. The five curves in fig. 3 illustrate typical results. Fig. 3a shows a condition of ideal commutation, as already described. Fig. 3b shows the curve obtained with a weak interpole, which, by retarding commutation, produces an excessive current density at the toe of the brush, and, as a general rule, sparking. The contact drop varies approximately as the

FIG. 3.

current density, and is seen to be low at A and high at C. Fig. 3c is the reverse of the above, and shows the curve obtained with a strong interpole field, which has the effect of hastening commutation, and thus producing a low current density at the toe, thereby lessening any tendency to spark. Fig. 3d shows the effect of a reversed interpole field, which would, of course, lead to vicious sparking, and fig. 3e, the effect of an excessive increase in the interpole field strength. The curves do not indicate the absolute current density at a point on the brush, because the current density is continually varying at any one point, so that the reading on the voltmeter is merely the average contact drop. Still, they do indicate the nature of the commutation conditions the brush is being called upon to withstand, and give a true indication as to whether the interpole flux is correctly adjusted, and if not, how it should be changed to produce a condition nearer to that of ideal commutation.

THE PRODUCTION AND DISTRIBUTION OF POWER, AND ITS INFLUENCE ON THE DEVELOPMENT OF IRISH INDUSTRY.

By J. F. CROWLEY, D.Sc.

(Abstract of paper read before the IRISH TECHNICAL CONGRESS, DUBLIN.)

NOTWITHSTANDING the many sources of power apparently open to us, over 90 per cent. of the power used in industry in the United Kingdom comes from reciprocating steam engines or steam turbines using coal as a prime source, and less than 10 per cent. is derived from all other sources. Coal, therefore, is our principal source of power, and it is important to inquire how we stand with regard to our supplies of it.

In 1905 it was estimated that "the available quantity of coal in the proved coalfields of the United Kingdom was 100,914,668,167 tons, and in the unproved coalfields 39,183,000,000 tons, at depths of less than 4,000 ft. in both cases, while the total figures for available coal in Ireland were given as 174,458,000 tons.

The amount of coal raised in the United Kingdom in 1903 was 230,334,469 tons. The average yearly output for Ireland between the years 1880 and 1902 was 115,500 tons, and for the past 12

years only 86,000 tons, with average yearly imports during the same period of 4,574,231 tons. Of the total coal raised annually in the United Kingdom, 63,805,000 tons are exported in one form or another, the remainder being consumed at home. Apparently, then, if we ignore the needs of future generations we can continue to use coal at our present rate for very a considerable time without any fear of exhausting our supplies.

There is another side to this matter, however. While our supplies of coal are very great, we cannot go on increasing our yearly output indefinitely, and the price of coal at the pit mouth is steadily advancing, while, on the other hand, our need of this important commodity is steadily growing. We must, therefore, seek some method of economising in the use of coal employed for power purposes, and may consider the following possible methods:—

- (a) A reduction in the amount of power used for industrial purposes.
- (b) The development of alternative sources of power.
- (c) Economy in the methods of producing, transmitting, distributing, and applying power.

In considering whether it is practicable to reduce the amount of power used in industry, the following table compiled from figures given in the Census of Production (1907) Report should be of interest:—

—	Excess of value of work done over cost of materials used in pounds.	Number of operatives employed.	Engines owned. Total H.P.	Net output per operative employed.	H.P. per operative employed.
England and Wales ...	602,994,000	5,808,269	9,097,869	104	1.56
Scotland ...	86,364,000	885,403	1,397,733	98	1.57
Ireland ...	22,777,000	291,304	259,407	78	.88

Column 1 gives the value of the total output of all the industries of the United Kingdom covered by the Census of Production, less the value of the raw materials purchased and the amount paid to other firms for work given out. This value is called the "net output," and is a figure of considerable value, as it gives without duplication the value added to the raw materials during manufacture.

Column 4 gives the "net output" per operative per annum, and judiciously employed is a figure of the greatest importance for comparing the efficiencies of various industries or groups of industries.

In a paper read in Manchester in 1912 I expressed the relation between the various quantities above referred to algebraically, as under:—

If M = the value in pounds of one year's raw material,
 S = the " " " " output,
 N = the number of operatives, and
 K_1 = a constant for a particular industry or group of industries,

$$\text{Then—} \quad M + K_1 N = S. \quad \dots \quad (1)$$

For the industries of the United Kingdom, taken as a whole, the constant K_1 has a value of 102.

Still following the method of treatment developed in the paper referred to, and since the "net output" has to provide all wages, standing charges and profits, we have—

If P = profits in pounds per operative per annum,
 C = cost of power " " " "
 R = rent, rates and taxes, maintenance, interest and depreciation in pounds per operative per annum,
 W = the wages in pounds per operative per annum,

$$P + C + R + W = K_1. \quad \dots \quad (2)$$

From the Board of Trade Reports on Earnings and Hours of Labour we obtain the average wages of all operatives in a given industry, and we thus obtain the value of W , which enables us to re-write (2) thus:—

$$P + C + R = K_2. \quad \dots \quad (3)$$

The following table, which gives the values of certain of the above figures for industries which are of special importance to Ireland, may be of interest:—

—	H.P. per operative.	K_1 .	W .	K_2 .
Lace28	98	£54.5	£43.5
Cotton ...	2.16	79	48.0	31.0
Wool and worsted, carpet, flock and shoddy ...	1.23	70	40.0	30.0
Elastic webbing36	68	37.0	31.0
Hosiery15	61	38.5	22.5
Silk58	55	34.5	20.5
Linen, jute and hemp (spinning and weaving) ...	1.09	61	31.5	29.5
Bleaching, dyeing, finishing, and printing of textile goods	1.83	101	54.5	46.5

As already pointed out, it is usual to take the values of K_1 for different industries, as indicating to some extent their efficiency as competing entities; I would suggest that K_2 , a figure that is available for all countries for which K_1 can be obtained, forms a better basis for comparing industries as trading bodies abroad, since high wages, while they increase the value of K_1 , have an adverse effect on ability to compete.

The only really practical test, however, is the price at which competitive articles are placed on a suitably chosen neutral market.

By a work first published in 1916, public attention was focussed on the fact that in comparing two similar trades in different countries, a high value of K_1 is almost invariably associated with a high horse-power per operative. The horse-power per operative for England, Scotland, and Ireland at the time of the last Census of Production, as given in a previous table, was 1.56, 1.57, and 0.88 respectively, the corresponding figures for K_1 being 104, 98, and 78. If we turn to America, we find figures for K_1 varying over a wide range of industries between one and a-half and three times as great as those for the United Kingdom with the horse-power per operative between one and a-half and six times as great.

It should be clear, then, that if wages are to improve and capitalists to receive an increased return on their investments, both essential to the advancement of industry, an increased amount of power must be introduced into industry; and instead of being able to effect coal economies in this direction, we must be prepared to meet fresh demands on our resources.

We may now consider our second alternative—viz., the development of other sources of power. First, as regards peat; the principal problems to be solved if peat is to be successfully used on a large scale for power purposes, are:—

- (a) The securing of rights over an area of bog containing peat with a suitable nitrogen content, and sufficiently large to provide power for a period long enough to justify the capital expenditure involved. This may be difficult in some cases owing to vested interests and the existing turbary rights of small holders.
- (b) The development of a suitable method of "winning" peat on a large scale from the bog.
- (c) A commercial process for the removal of surplus water from the required quantity of peat.

Granted the provision of a continuous supply at a sufficiently low cost of peat with a water content not much exceeding, say, 50 per cent., it may at once be said that there are no unsurmountable engineering difficulties to prevent peat being used on a large scale as a substitute for coal for the production of power, in gas engines for small and medium powers, and preferably in steam engines for large powers.

Oil may form a substitute for coal to a certain extent, provided the supply can be made more reliable, and the price per ton brought down to a sufficiently low figure, and kept out of the realm of speculation.

It may be interesting to note in passing that the largest oil engine so far built is a two-cycle single-acting Diesel engine, completed during the present war to the order of Messrs. Harland and Wolff, of Belfast. This engine was built in Switzerland for an output of 3,750 H.P., and gave 4,500 H.P. on the test bed.

The only source of power other than peat that we need seriously consider in this country as a substitute for coal is water. The Coal Commissioners (1905), in dealing with this matter, suggest that it is desirable to examine into the capabilities of the water powers in Ireland, as small sources of power might be used economically where there is little or no competition with coal. There is no doubt that it is eminently desirable that the investigation suggested by the Commissioners should be carried out. Matters for consideration in connection with the development of water power in this country are existing and future navigation and fishery rights, and the peculiar geological formation of the country, which raises important questions with regard to drainage. It should not be overlooked that the capital cost of a scheme for developing power from water is almost always much higher than the cost of a corresponding steam plant.

Altogether I think it may be said that for the United Kingdom, as a whole, no new facts have arisen since the Royal Commissioners' Report, to which reference has been made, to alter the conclusion they arrived at—viz., that "coal is our only reliable source of power, and there is no real substitute." With regard to Ireland, however, the bulk of the coal consumed is sea-borne; its cost is consequently higher than in Great Britain, and a very strong case can be made for a careful and systematic investigation of Irish resources in coal, peat, and water power, and of the best methods of utilising these for the development and distribution of power.

The production of power from large power units in central power stations is incomparably more economical in coal consumption per horse-power than the present method of production in small scattered plants, and the decrease in coal consumption with size of generating unit continues far beyond the largest size unit so far built. Further, the cost of power produced falls off even more rapidly with the size of generating unit than does the consumption of fuel. It may be of interest to note, in passing, that the Germans claim to be building just now the world's largest single electrical unit, of an output of 60,000 K.V.A., or at a power factor of 0.8, approximately 65,000 electrical H.P. I mention this advisedly, as it shows that the Germans are working on the same lines as we are with regard to the economical generation of power.

The production and distribution throughout suitably chosen areas of economic size of power in bulk from large suitably situated central power stations would, at a conservative figure, save us 50 per cent. of our present coal bill for power purposes, and effect a still greater percentage saving in the cost of the power generated.

Power engineers generally are agreed that the steam turbine is the most suitable prime mover to produce power on a large scale, and electricity the most suitable agent to distribute it. The steam required can be raised from coal, fired in the ordinary way, coal-

dust, producer gas made from coal, waste gases of any kind as coke oven, blast furnace gas, &c., natural gas, water gas, peat fired directly under boilers, peat powder alone, or mixed with coal, producer gas made from peat, &c. or from oil. There are many points in favour of factory owners taking bulk electrical supply from central generating stations, and many well-known advantages in driving the machinery electrically.

Any advantages claimed for electric driving generally can be claimed for individual electric driving also; while, in addition, special advantages can be obtained with this drive in certain cases, such as: (1) Saving in the power consumed; (2) increased production due to (a) peculiar advantages in the case of certain machines, resulting, in some cases, in an increase in production varying from 10 to 25 per cent.; (b) better supervision, &c.

General opinions such as have to be expressed in a paper such as this are naturally subject to revision based on developments in engineering or increases in the cost of power; Belfast may, one day, for instance, receive its power electrically from the coal-fields of Scotland, but I do not see any reason to anticipate any substantial revision in the immediate future.

I have endeavoured in the short time at my disposal to show that coal is our main source of power, that there is reason to fear that supply will not always keep pace with demand, that the price will steadily advance, and that in our endeavour to economise in its use and at the same time provide cheap power for our industries we would do well to consider the use of peat and of water as alternative sources of power. Further, considerable economies can be effected by producing power in bulk in central stations, transmitting it electrically to the industrial centres of the country and distributing it to consumers, both large and small.

STEEL TROLLEY WIRE.

In an article in the *Electric Railway Journal*, S. H. Anderson describes the successful use of steel trolley wire on the Pacific Electric Railway.

The company put up its first steel trolley wire in February, 1910, with a view to testing its value against copper costing 15 cents a lb.; now copper is valued at 40 cents and steel costs 12 cents a lb., and since 1910 the company has gradually extended its use until about 100 miles of No. 0000 double-grooved Roebling steel wire has been erected. The first steel trolley wire was for 600-volt direct suspension, and was butt-welded and ungalvanised. Galvanised wire was then adopted to prevent corrosion, and a lap-welded braze superseded the butt joint on account of the wire parting at the factory splices. This eliminated most of the trouble, but it was necessary to provide an oxy-acetylene welding outfit to weld the wire on site when breaks occurred. Seven years' service on a line with a 3 or 4-minute service during rush hours, shows the wire to be in first-class condition as a whole. It has a smooth under surface, and no signs of wear at clips, switch points, or splices, contrary to the condition of copper trolley wire.

Since the copper and splice at the ends of the steel wire has been renewed twice since 1910, and as the steel is good for four or five years more, the life of the steel on tangents should be three or four times that of copper. At accelerating or feeding points, however, steel is not expected to last longer than copper, if as long. In 1912, some 1,800 ft. of steel wire was installed on a high-speed catenary line with a 3 or 4-car train service. Inspection shows 13 per cent. wear on tangents, and 22 per cent. at clips of hangers; future life estimated at 3 years. On curves the wear is 22 per cent. on the run and 29 per cent. at clips; future life estimate, 2 years. About 500 ft. of tangent was renewed this year, owing to wear due to heavy arcing at accelerating points, the wear being as great, or greater, than with copper.

The most important installation is on a stretch of line operated at 60 to 70 M.P.H. on 1,200 volts, where the smaller current induces less burning than on the 600-volt lines.

It is not found that trolley wheels wear out faster under steel, but it is surmised that the pneumatic trolley bases, which keep a constant upward pressure, may be the reason.

A larger number of feed-in points are required; on the San Bernardino line, with a copper circuit and steel messenger in parallel with the trolley, the feed-ins are 450 ft. apart. For direct suspension, a feed-in at every other pole—that is, 220 ft. apart—is being gradually adopted.

Generally speaking, the maintenance on steel trolley wire is far below that on copper; the steel is harder, the clips hold better, and the wire does not break if the trolley pole hits a span. No breaks have been due to crystallisation at ears, &c., and where wire has broken and shorted to the rail, it can usually be restrung, whereas copper would become annealed. The steel is easier to pull up, and its wear is almost all due to burning and arcing.

For welding, rods of $\frac{1}{8}$ in. or $\frac{3}{16}$ in. nickel steel are used, the time taken to weld the wire in the air being 10–15 minutes.

Bending tests showed that the wire would stand six right-angle bends in a vice before breaking, and heating tests, by passing current through the wire until red hot, showed that though the galvanising burnt off, the wire was otherwise uninjured. Tests showed the resistance to be 0.00342 ohm. per ft. at 100° F., or 6.53 times that of No. 0000 copper under similar conditions; being 10.6 per cent. lighter, its resistance per unit of weight is 5.83 times that of copper.

INDUSTRIAL RECONSTRUCTION.

THE following recommendations on the Whitley Report on Industrial Councils have been put forward by the FEDERATION OF BRITISH INDUSTRIES, and are referred to in our leading columns to-day:—

1. The Federation cordially endorses the view of the Reconstruction Committee as to the vital importance of securing co-operation between employers and workpeople after the war; it is needless to recapitulate the many difficult problems which are likely to arise, some of which are touched upon in the Report of the Committee, but few can fail to realise the serious consequences to our commercial and national position which may result from failure to secure harmony between employers and employed. Efficiency of production is a prime consideration. For this it is necessary to have co-operation and agreement with labour, who in return will, and are entitled to, demand improved conditions of employment, a higher standard of comfort generally, and opportunity of appreciating the true interests of the trade in which they are engaged.

The complement of efficiency of production is efficiency of management, whether in the organisation of works and of business, in inventiveness, or in the study and capture of world-wide markets. Such management is at the base of an intensive demand for labour, and must be guided and controlled by the best individual brains of the country. Care must therefore be taken not to interfere with their work, but to afford them the fullest scope, for without an intensive demand for labour it is hard to see how the best conditions can obtain. Any scheme for reconstruction must therefore have regard to the importance of efficiency, both in business and productive methods and in commercial management, and nothing in the suggested Councils should tend to impair or interfere with development in this direction.

2. The Federation cordially welcomes the views expressed by the Committee as to the important part which must be played by Associations in the settlement of these difficult questions, and expresses the opinion that it is indeed only by the establishment in each trade of organisations representative of employers and workpeople respectively that the object can be achieved.

The Federation, therefore, would lay particular emphasis upon the views expressed in Paragraph 23 of the Report:—

"It may be desirable to state here our considered opinion that an essential condition of securing a permanent improvement in the relations between employers and employed is that there should be adequate organisation on the part of both employers and workpeople. The proposals outlined for joint co-operation throughout the several industries depend for their ultimate success upon there being such organisation on both sides: and such organisation is necessary also to provide means whereby the arrangements and agreements made for the industry may be effectively carried out."

While agreements in the fullest sense can only be made between organisations representing each side, it is almost impossible to provide security for such agreements if any appreciable portion of workpeople on the one side, or manufacturers on the other, are not members of their respective organisations, and are consequently not bound by the agreements.

In the opinion of the Federation this point is so important that they suggest that the Government ought to go far to recognise, and give an official standing to, organisations representative of employers and workpeople respectively, and to encourage the development of such organisations.

3. The recommendations of the Committee are far-reaching and important, but it will be readily admitted that the construction of an organisation on the lines suggested is a delicate matter, and the Federation notes with satisfaction that in the creation of the proposed organisation it is not contemplated that the Government shall actively interfere. The Federation desires to emphasise this point, and to urge that while sympathetic Government assistance may be, and doubtless will be, of great value, it is most important that there should be no suggestion whatever of Government pressure or coercion, and that each trade shall be free to build up its own organisation voluntarily and on lines best suited to its peculiar needs.

4. It may be pointed out that the descriptions in the Report of the various Councils are somewhat vague and uncertain. The Federation, however, understands that the National Industrial Councils referred to are Councils of individual trades, and not national in the literal sense.

The Federation is of opinion that the basis of the scheme should be Trade Councils of masters and men—that is to say, that each trade or section of an industry should form a Council representative of the employers' organisation or organisations and of the Trade Union or Trade Unions concerned with such particular trade or section of an industry. This Council should have the sole power of dealing with agreements of all kinds and any other matters appropriate to the particular trade or section of industry.

Some difficulty arises in this connection owing to the existence of Unions in certain cases overlapping various different sections of trade. This, however, is a matter of detail which could no doubt be easily overcome.

5. In the opinion of the Federation, devolution of constructive work to District or Works Committees would be very dangerous. It should only be permitted to develop in the light of experience.

6. It is suggested that the main value of District Councils would be to constitute a court of arbitration in the case of any difference between employers and employed in the trade in the district, having regard to the general and any peculiar conditions obtaining in that district.

7. In the opinion of the Federation the Works Committees

should be entirely voluntary in the case of each individual firm, and not in any way officially constituted. They should consist entirely of representatives of the employes, and they should, if possible, be elected by secret ballot. Where instituted their duties should be confined to reporting to, or receiving from, the management complaints regarding breaches of any agreements which may have been made between employers and employed.

8. It appears to the Federation that the general principle underlying these suggested Councils should be the centralisation of policy and the decentralisation of administration.

9. The Federation suggests that while the proposed Trade, or as they are designated in the Report National, Councils, may be well suited for discussing questions peculiar to the trade, and may provide a suitable Court of First Instance for the settlement of disputes, it would be highly desirable that superior bodies should exist, consisting (1) of representatives of employers and employed in each group of trades forming an industry, which might possibly be styled "Councils of Industry," and (2) of representatives of the employers and employed in all industries, which might possibly be styled "The National Industrial Council."

The Councils of Industry and the National Industrial Council would provide suitable Courts of Appeal from the Trade Councils in cases of differences between employers and employed in any trade which cannot be settled by the Trade Council. It is not necessary to suggest exact details of procedure, nor is it intended to interfere in any way with existing Conciliation Boards or other arrangements for settling disputes, but rather to build up similar organisations in industries where they do not at present exist, and only to supplement existing organisations.

The Federation is of opinion that provision of methods for preventing or settling differences is almost as important as provision of facilities for co-operative action, and the Federation is of opinion that if no strike or lock-out could take place until the question had been submitted to final arbitration by a truly National Council of employers and employed, there would be good grounds for hoping that the time for reflection afforded, and the pressure of popular opinion, would ensure the loyal adoption of the award.

10. With regard to the consideration of general questions, amongst which many of the most important are mentioned in paragraph 16 of the Report, the Federation are of opinion that these should be dealt with primarily by the National Industrial Council, which should delegate to the Councils of Industry, and possibly to the Trade Councils, the consideration of matters of peculiar trade interest in such cases as the National Industrial Council may think desirable. The final decision in all matters of general policy should be taken by the National Industrial Council after providing reasonable opportunities of criticism on the part of the Councils of Industry and Trade Councils. Nothing in this suggestion, however, is intended to prevent the Trade Councils or Councils of Industry from initiating the consideration of any matter of general interest.

SYSTEM OF INDUSTRIAL COUNCILS RECOMMENDED BY THE FEDERATION OF BRITISH INDUSTRIES.

National Industrial Council.—Composition.—Representatives of employers and workpeople from all industries.

Duties.—Final Court of Appeal in disputes. Primary body for consideration of questions in Clause 16 of Whitley Report, with powers to allocate specific questions to other Councils. Should take final decision in all matters of general policy after giving ample opportunity for discussion and criticism by Councils of Industry and Trade Councils.

Councils of Industry.—Composition.—Representatives of employers and employed in each group of trades forming an industry (such as the textile trades, &c.).

Duties.—To act as a Court of Appeal from the Trade Councils in disputes. To deal with all special matters which may be allocated to them by the National Industrial Council, to initiate consideration of matters of general interest to the particular industry with which they are concerned, and to forward such matters to the National Industrial Council if of general interest, and to consider, and, if necessary, forward to the National Industrial Council any such matter initiated by a Trade Council.

Trade Councils.—Composition.—Representatives of the Employers' Organisation or Organisations, and of the Trade Union, or Trade Unions, concerned with a particular trade or section of an industry.

Duties.—First Court of Appeal in case of disputes. Sole power of dealing with agreements and all other matters pertaining to the particular trade or section, and with any special matters delegated to them by the Council of Industry or by the National Industrial Council.

Works Committees.—Composition.—An elected body of workpeople in each works, to be set up only by the joint consent of the individual employers and employed concerned, their institution to be entirely voluntary.

Duties.—Reporting to, or receiving from, the management complaints regarding any breaches of agreements which may have been made between employers and workpeople.

TRADE STATISTICS OF SPAIN.

The figures given below show the imports of electrical and similar goods into Spain during the year 1915, according to the official statistics recently issued. The figures for 1914 are given for purposes of comparison, and notes of increases and decreases (which are very considerable) have been added:—

	1914.	1915.	Inc. or dec.
	Pesetas.	Pesetas.	Pesetas.
<i>Arc lamps.—</i>			
From Germany ...	66,000	9,000	— 57,000

Electrical Trades Union.—An organising meeting of power and sub-station engineers was to be held by the London District Committee on Wednesday last. All central station and sub-station men were invited to attend and to hear what was being done for the station men. "Join us, and so hasten the day when your Trade Union shall control the electrical industry. Over 600 station men already in our ranks in London branches."

NOTE.—25 Pesetas = £1.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

Temperature Indicators for Electrical Apparatus.

The rating of electrical machinery depends in most cases purely upon the temperature of the insulated windings; as a rule the efficiency is high on "overload" and even if this is not the case the fixed charges per KW. are so much reduced on overload that the loss in efficiency will often be comparatively negligible. Hence it is important to distinguish between the nominal overload which a machine is rated to carry and the actual overload which it can safely deal with in actual practice, bearing in mind that the duration of the overload is an essential factor in this question. Yet very little has been done hitherto with a view to enabling the operating staff to run machines at their full practical output, regardless of the figures on the name plate, though really important economies in capital cost might be effected by this means.

The *Electrical World* states that the GENERAL ELECTRIC CO., of Schenectady, has developed temperature indicators which, when used in conjunction with temperature coils in electrical apparatus, afford a convenient means of indicating continuously at the switch-board the temperatures of various portions of the windings of electrical apparatus under various conditions. The indicator is a direct-current differential indicator with three terminals. Its

FIG. 1.—CONNECTIONS OF TEMPERATURE INDICATORS.

operation depends on the variation of resistance of a copper resistor placed in a slot of the machine stator in contact with the insulation of the winding, or in any location, external or internal, where the resistor may be protected from the conductors by suitable insulation. Four temperature coils are used on machines rated at 500 KVA. to 3,125 KVA., two of the coils being considered as spares. Above 3,125 KVA. six coils are used, three of which are spares.

One of the windings of the temperature indicator is in series with a coil of manganin, having a resistance equal to that of the temperature coils (usually at 80° C.). The other winding is in series with the temperature coil itself. When the temperature in the copper coil rises, the current in the branch of the circuit including the temperature coil decreases, causing a corresponding deflection toward the higher temperature end on the indicator scale. The reverse action occurs when the temperature of the temperature coil falls. The scale of the standard instrument has a range of 20-120° F. or 0-90° C., marked in 1° divisions. The temperature coils are made of copper wire wound in a thin form and pressed flat so as to be non-inductive. Current is derived from the supply circuit. The connections of the apparatus are shown in fig. 1.

Cable-pulling Eye.

In pulling cable it is considered good practice among some cable men to make an attachment to the cable conductors as well as the sheath in all duct runs over 375 ft. (114 m.) in length. To facilitate such a connection, one of the foremen of the General Electric Co.'s cable-pulling crew, working on large cables at Cincinnati, developed an attachment eye shown herewith, fig. 2.

This device is made in two styles. One of them is a solid forging about 9 in. (22.8 cm.) long, having an eye at one end. The shank is made of 1-in. (2.54 cm.) round stock, one end being upset or spread out in the form of a truncated cone. In this cone are

three grooves which extend from the base toward the shank of the device.

In using this device the sheath of the cable to be pulled is cut saw-tooth fashion for several inches back from the cable end; the lead is then turned back and the conductors are peeled. After this operation the conductors are laid in the grooves in the cone-shaped end of the pulling device, and the strands are served around the

FIG. 2.—ATTACHMENT EYE.

shank of the tool. The saw-toothed lead-sheath ends are then bent down closely around the conductors and solder is sweated into the joint, making a smooth wiped joint. With these joints properly made it has been possible to break ropes designed to stand a 6'8-ton load without parting the joint between the cable and the eye. The second style of attachment eye is like the first, except that a swivel is used in the shank.—*Electrical World*.

Armature-winding Machine.

This machine has been invented with the idea of expediting the output, thereby cheapening cost, and to obviate the use of skilled labour, male or female. This applies especially to places where labour is of so migratory a character that it is always a problem to those who have to get this work done. The machine here illustrated is the experimental one, and will wind armatures up to 3 in. in diameter, but the machine as intended for commercial purposes will wind up to 5 in., after which it is usual to wind with formed coils. The inventor, Mr. L. E. WOOD, A.M.I.E.E., states that the machine follows the hand method as nearly as it is possible to do so, fills the slots and piles up the ends in less space and more neatly than is possible by hand, and will wind 3 to 1 with the best female winder he has yet seen—that is with the experimental machine; better results are claimed for the commercial machine. No previous experience, skill, or training is necessary; any boy or girl can operate a number of machines according to the size of the armature and number of turns per coil. All that is necessary on the part of the operator is to put in the loop and

adjustments being made by turning hand-wheels while the machine is running.

The armature runs at the same speed and in the same direction as a dummy shaft. This shaft carries two weights, which may be shifted toward or from each other. The armature and the dummy shaft are supported together on a bed which is hinged at one end and free to vibrate vertically at the other end under the influence of any unbalanced couple in the armature or in the weights. When the weights are brought close together they exert no couple, but any running unbalance in the armature will cause the bed to vibrate. The weights are then moved to such positions that the couple they exert is opposite and equal to that exerted by the armature; the vibration then stops. Since the weights and their radius from the centre of the shaft are predetermined, it only remains to measure their distance apart to calculate the couple they exert. With this known, it is easy to calculate what weights should be added to or subtracted from points of known radius at known distances apart in the armature to produce a similar couple in the opposite direction. In order that the plane of unbalance may be determined, the dummy shaft is arranged so that it may be rotated with respect to the armature. The weights may be shifted on their shaft without stopping the machine.

To apply the readings of the machine to the object tested, a set of charts is used from which the readings in ounce-inches are converted directly into diameter and depth of holes to be drilled at the specified radii and specified distances apart. This is usually more convenient than adding weights.

The makers, the CARLSON-WENSTROM Co., of Philadelphia, state that the machine will easily handle 100 armatures in an eight-hour day.—*Electrical World*.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Employment of Disabled Soldiers.

It was with great pleasure that I perused your valuable journal of July 27th, and on page 87 you called attention to the recent advertisement which had the audacity to call for invalid young officers, at a salary, including war bonus, of 37s. per week, to act as switchboard attendants. It goes to prove that the undertaking concerned values the "invalided young officer," who has had to bear the "burden and heat of the day," at a low rate; and it is also unfortunate that the letters appearing on page 128 of your issue of August 10th have apparently been inspired by authors who have not yet had any experience of active service during the past three years.

I would point out to the authors of the letters that such an advertisement as referred to does not materially help their position, as it obviously follows that probably an advertisement might appear calling for shift engineers, worded similarly.

Before the war, the condition of pay to central-station men was deplorable, and it looks as if the advertisement in question tends to make the position worse. Therefore, it behoves those who are at present spared the trials and hardships of active service not to kick against the Editors of the ELECTRICAL

REVIEW, but to protest, and protest strongly, against the advertisement and the undertaking which inspired it. It is to be remembered that in these days hundreds of commissions are given from the ranks, irrespective of a man's station in life; therefore I cannot understand the attitude of the writers of the letters. If anything is to be done to raise the status and increase the salaries of central-station men as a whole, it must be by a concerted action, and not as a divided party. It would therefore appear that the steps taken by the Institution of Electrical Engineers, with their new scheme, are absolutely on the right lines; and I do most sincerely hope that the Institution of Mechanical Engineers and other kindred institutions will do likewise in organising some scheme to provide employment for those unfortunate invalided men who, in the prime of their vigour and manhood, have given their best to keep the invader at bay. The people at home, however much good work they may be doing, have no conception of a modern battle and the terrible conditions under which the men out here have to exist.

As one who has been on active service for over two years in France, an advertisement like the one quoted above caused me to wonder who was the author and what the central-station men think of it who are on active service on the different fronts.

FIG. 3.—ARMATURE-WINDING MACHINE.

revolve the armature to the next slot, which is done by a graduated disk, restart the machine, pass on to another, and repeat the process; an electrical device stops the machine when the predetermined number of turns is reached. The machine has been developed so as to be entirely automatic, if required—that is, to form the loop and move the armature to the next slot.

The power required to run one machine is approximately $\frac{1}{2}$ H.P.; where a number of machines were used they would be grouped on shafting, driven by a suitable motor.

It is proposed to make the machine in two sizes—one for the smallest armatures up to, say, 2½ in., the other from 2½ in. to 5 in. The machine is in process of being patented in the U.S.A. and other countries, and the inventor would be pleased to hear from any one interested with a view to its being exploited in the United Kingdom. His address is P.O. Box 427, Valleyfield, P.Q., Canada.

Dynamic Balancing Machine.

True running balance may be quickly secured in an armature, motor crank shaft, turbine rotor, fan, or other high-speed rotating part by the use of a dynamic balancing machine built under the

It is to be hoped that after the above trespass on space in your valuable journal, the authors of the various letters will take a different view of the situation.

A.M.I.Mech.E., A.M.I.E.E.

B.E.F., France.

The Psychology of Shift Work.

In reference to my letter in your issue of August 17th, it should read: "Secretary, Birmingham Station Engineers' Branch, Electrical Trades Union."

Thos. N. Morris.

WAR ITEMS.

Trading with the Enemy.—In the "London Gazette" of August 17th is given an amended list of persons and firms in neutral and allied countries with whom trading is prohibited.

Employment of Women.—Returns made by employers to the Board of Trade show that since July, 1914, the number of women employed mainly in industries and commerce and Government establishments has increased by one and a quarter millions, and about the same number of men have been directly replaced by women. Between January and April, 1917, there was an increase of 51,000 women in industrial occupations.

Bribery in War Time.—The valuable "News-sheet" of the Bribery and Secret Commissions Prevention League, Inc., states that in the three war years ended August 4th there have been directly connected with the war 22 convictions on indictment under the Prevention of Corruption Act, and 27 summary convictions. During the same period there were 26 convictions, eight on indictment, purely civil. Together there were 90 cases, including five untried and 75 convictions, 56 of which belong to the present year, irrespective of convictions for bribery under other Acts and the common law.

A Dublin Wiring Contract.—The contract for the electric lighting of Coleraine House, Dublin—a Government Department—has been the subject of some comment. It is now officially announced that five contractors were invited by the Board of Works to tender for the work; that three responded, but that the tenders were in excess of the Board's estimate; and that, as no substantial modifications could be obtained, and as the work was urgent, it was decided to ask the General Post Office Telegraph Department, Dublin, to undertake the work. In the opinion of the Government, no further action is required, though, needless to add, local opinion differs.

Munitions Levy.—With the passing of the Finance Act the duty of assessing munitions levy up to December 31st, 1916, when the levy ceases, passes to the Board of Inland Revenue, and the staff engaged on this work is transferred to that department. In dealing with the question of the values of plant, buildings, and machinery erected or installed in controlled establishments for munitions work, the Board of Inland Revenue has made arrangements to retain the honorary services of the Valuation Advisory Committee of eminent experts, formed by the late Mr. Howard Chatefield Clarke, and consisting of Mr. Basil Mott, Captain H. Riall Sankey, C.B., R.E., Lieut.-Col. C. L. Morgan, Mr. Leslie R. Vigers, Mr. H. M. Jones, and Mr. J. George Head, who have for the past 18 months been almost daily occupied in visiting controlled establishments in various munitions areas and advising the Ministry of Munitions on the extensions therein.—*Financial Times*.

A Munitions Council.—The Minister of Munitions has formed a body, to be known as the Munitions Council, including the Minister as President, two Parliamentary Secretaries as Vice-Presidents, and 10 members, each representing a group of departments of the Ministry, together with a secretary. The staff of the Ministry at headquarters has increased from 5,000 a year ago to 13,500 at present; the Department employs in all about 2,000,000 persons, and is responsible for the expenditure of over 600 millions sterling per annum. The possibilities of further expansion to meet the needs of the situation are approaching exhaustion, and it is necessary to seek the means of increasing production by improving the efficiency of the organisation. The new Council will be the intermediary between the Minister and the component departments, which number over 50; it will aid and advise the Minister, and will fill a rôle similar to that of the Board of Admiralty or the War Council, relieving the Minister of much administrative work, and dealing with important questions affecting more than one group of departments. The scheme was brought into effect on Monday last, the following being the members of the Council and the groups of departments under them:—Finance: Sir H. Hambling. Design: Major-General the Hon. F. R. Bingham. Steel and Iron: Mr. John Hunter. Materials, &c.: Sir E. Moir. Explosives: Sir K. Price. Projectiles, &c.: Sir J. Stevenson. Guns: Sir G. West. Engines: Sir A. Duckham. Allies: Sir F. Black (*pro tem.* Sir C. Ellis). Labour: Sir S. Kent.

China and the German-Asiatic Bank.—As a result of China's entrance into the war, the German concessions at Tientsin and Hankow revert to China, the large financial obligations to Germany are cancelled, and her extra-territorial privileges are abolished. All the offices of the Deutsch-Asiatische Bank have been sealed up, and foreign bankers, in conjunction with a Chinese official, have been instructed to liquidate its affairs.

German Methods in South Africa.—The August issue of "Production," the monthly report of the British Empire Producers' Organisation, contains an abstract of an address in which Mr. E. Saunders, of the S.A. Federated Chamber of Industries, explained the German "Circle System" which enabled the German engineering firm of Koppels to secure a grip of the mining and engineering trade of the Transvaal, and to continue trading freely even after the outbreak of war. Large groups of mines were worked on the "circle" system, almost all the orders for machinery going to Germany, and large portions of the surplus funds being invested in German, Hungarian, and Turkish securities before the war.

War Poetry.—We have received a copy of "Stand Down," a small book of poems written by Mr. Donald H. Lea, of the New Zealand Expeditionary Force; the author is the younger son of the late Mr. Henry Lea, the well-known consulting engineer, and we regret to add that owing to the ill-effects of being gassed in France, where he was serving in a Machine-Gun Section, he had to be invalided out of the N.Z. Force. In a brief "Foreword," Sir Thos. Mackenzie expresses the pleasure that the poems have given him, and we can cordially endorse the judgment of the High Commissioner for New Zealand. The poems all relate to incidents or aspects of the great war; a few are humorous, but most are pathetic, and some sublime. We defy any lover of children to read "First Aid" unmoved. The author is to be congratulated on his excellent work, and we trust that it will be continued.

Trade Cards and Exemptions.—At Southwark, Coun. Weaver drew attention to the decision of Mr. F. Mead, the magistrate at the South-West London Police Court, in dealing with a charge against an engineer of being a deserter, but who held a card under the protected trades schedule. Mr. Mead held that the card was *ultra vires*, as it was issued by a munitions area recruiting officer, to whom powers under the Military Service Acts could not legally be delegated. He maintained that the card was not an exemption, and was null and void, although the Military had given a promise to the holders of these cards that they should not be called up for military service. Coun. Weaver pointed out that it placed the men who held these trade cards in a very serious position, for by Mr. Mead's decision they held no legal exemption, and were liable to be called up for military service. If they did not join up they might be arrested and charged as being deserters. The Military Representative replied that Mr. Mead, who was the chairman of the Lewisham Tribunal, had always held that these cards were not exemptions under the Military Service Acts. In the case before the magistrate an error had been made by the military authorities, for when the man was arrested they were not aware that he held a card; but when they found that he did hold one, they did rightly in at once offering to withdraw the charge. Mr. Mead would not consent, and, ignoring the honourable undertaking the military authorities had given the holders of the cards, said, in effect: "I want to call public attention to the fact that these cards are not exemptions under the Acts." Everybody knew that; but the reason why this Tribunal, and many other Tribunals as well, withdrew their exemptions to holders of these cards was that it was undesirable for men to hold two exemption cards, one from a Tribunal and the other under the Protected Trades Schedule, for one might get lost, and be found and kept by another man not entitled to it. He thought the Tribunal had adopted the best course in withdrawing their exemptions to the holders of the cards, but granting them the right to apply to the Tribunal again for exemption should the cards be withdrawn. The Tribunal decided to continue to adopt this course.

Exemption Applications.—A singular application came before the Manchester Appeals Tribunal, when a man named Macintosh, aged 37, carrying on a dairyman's business in the day-time and acting as electric crane-driver and attendant-in-charge of a private electric light and power works in Salford at night time, appealed for exemption. Mr. E. C. Pearson, solicitor, who represented the man, said it was not claimed that he was a skilled electrician, but owing to the dearth of labour the firm had been obliged to put up with his services. If he were taken, however, they would have to replace him by a skilled electrician, as he was in possession of a red protected trade card for his last employment. His present wages were 43s. 6d., for 53½ hours a week. The appeal was dismissed, and the man was told he would have to rely on his trade protection card.

On the recommendation of the Advisory Committee, Rochdale Tribunal has granted conditional exemption to five motor-men appealed for by the Corporation Tramways Committee; and until December 31st to J. B. Chadwick (41, B2), coach-builder, also appealed for by the Tramway Committee. Other appeals by the department were for J. Crossley (36, Class A), electric wireman, and for four motor-men, three in Class A and the other in B1. Mr. Webster stated that he had lost

43 drivers out of 88, and was still 14 short. He was trying to obtain substitutes wherever he could. Crossley was given conditional exemption, and the others were put back to November 15th.

Oswestry Tribunal has given exemption until January 1st to E. Jobson (37, Class A), electrical engineer.

At Weymouth, the borough electrical engineer appealed for the retention of W. O. Sargeant (26, Class A), stoker at the refuse destructor works. He stated that the Committee had not appealed for any of the 32 men employed at the works, and 24 had gone into the Army. The Military Representative contended that the occupation was not a certified one. The Town Clerk said that they had approached the Military, but they could not give a substitute. In reply to a question, Mr. Bolam said that with war bonus the man's wages were £2 2s. per week. The appeal was refused as from September 30th.

The County Appeal Court has dismissed a Military appeal against exemption until September 13th granted to an electrical engineer (39, B 2), in business at Hove.

Chester-le-Street Tribunal has given conditional exemption, on his undertaking some additional work, to J. Paruley (40), electrician at the Empire Picture Hall.

At a sitting of the East Kent Appeal Court, on August 13th, the Isle of Thanet Traction & Lighting Co. appealed against the variation of certificates granted to three drivers, aged respectively 37, 40, and 39, whose conditional exemption had been altered to exemption until September 1st. It was stated that as a result of an interview with the War Office, the latter had undertaken to find substitutes for the men, but none had arrived. The appeal was allowed, and exemption granted on each of the men remaining in their present certified occupations, unless suitable substitutes are found for them in the meantime.

At Oxford, the Tramway Co. asked for exemption for F. L. Chatwin (34, general service), fitter, and M. F. Sadler (33, C 1), unit adjuster, and each was temporarily exempted for three months.

At Wigan, an electrician who appealed claimed that he was indispensable to a firm of munition workers and Government contractors, and that he came within the list of certified occupations, and he was exempted until November 1st.

An appeal was made to the Herts. County Tribunal by Mr. M. J. Connari (37), electrical engineer, of Watford; appeal dismissed.

At Maidstone, three months' extended exemption has been granted to C. Butler (33, passed for general service), coal carman at the Corporation electricity works; and six months to J. E. Watkin (25, B 2), electrician at the Palace Theatre.

The Surrey Appeal Court has respite until called up an appeal filed by T. Hill (37, B 1), electrical engineer, of Farnham, he having been relegated to the reserve.

Frome Tribunal has granted a month exemption to two employees, single and passed for general service, of the electricity works, pending an appeal to the Munition Area Recruiting Officer for temporary exemptions.

The West Lancashire Rural Tribunal has refused an application for exemption for an electrical engineer and tractor driver by Major Fermor-Hesketh, of Rufford Hall. It was admitted that four tenant farmers on the estate had received notice to quit.

BUSINESS NOTES.

Ferranti Transformers.—MESSRS. FERRANTI, LTD., have recently secured the following orders:—

Rotherham Corporation.—Four single-phase transformers, 2,085 K.V.A. each.
Manchester Corporation.—Annual contract for transformers, 250, 500 and 1,000 K.V.A. sizes.
Salford Corporation.—One three-phase 250 K.V.A. transformer.

Circulars and Catalogues.—Tradesmen's catalogues and price lists, and all classes of advertising circulars, with certain exceptions, may be issued and dispatched from now up to January 31st, 1918, to the extent of one-third of the weight of paper used for the catalogues and price lists and advertising circulars issued by tradesmen between August 1st, 1916, and January 31st, 1917. For the purpose of this licence the expression "advertising circulars" includes any advertising sheet or periodical in the form of a newspaper or magazine, whether registered as a newspaper or not, which is distributed gratuitously, and of which advertising is the main, and not merely an ancillary purpose; diaries, almanacs, and calendars issued gratuitously, and containing advertising matter; but does not include circulars requesting the verification of information for books of reference. The expression "paper" includes cardboard or other similar material, or any substitute for paper.

Bankruptcy Proceedings.—C. B. OGILVIE, Whalley Range, Manchester, electrical engineer.—First and final dividend of 2s. 2½d. in the £, payable August 27th, by the Official Receiver.

Trade Announcement.—BRITISH ELECTRICAL FEDERATION.—The temporary address of the Federation and its constituent companies as from the 20th inst. is Manchester Hotel, Aldersgate Street, E.C. 1.

Sale.—Oldham Corporation has for sale two 740-KW. sets. See our advertisement pages.

Fire.—Early reports of the fire which took place at the works of the India-Rubber Co., Silvertown, on the 11th inst. appear to have been greatly exaggerated. Comparatively little damage was caused, and there was practically no disturbance to the manufacturing operations in the building involved.

Catalogues and Lists.—THE LONDON TELEPHONE (NEW SYSTEM) CO., LTD., Donington House, Norfolk Street, W.C. 2. Folder relating to the "New System" intercommunication telephone service.

MESSRS. JOHN MACLENNAN & CO., 90, Newgate Street, E.C. 1. Card drawing attention to electrical insulating tapes and tubular sleeving, cotton, linen, and silk tapes, &c. Scales of centimetres and inches are printed on the edges of the card.

MR. GEORGE ELLISON, Wellhead Lane, Perry Barr, Birmingham. Lists Nos. 151 and 304, the former describing the "Industrial Unit Type" switchgear, which is of the totally enclosed ironclad pattern for workshops and mines, each panel being a self-contained unit adapted for assembly with similar units to form a switch-board, and the latter relating to quick make-and-break switches operated by a tappet on a crane, hoist, or similar machinery, or by hand, with positive mechanism.

Book Notices.—British Westinghouse Motors and Generators in Industrial Service. This brochure (Instruction Book No. 5,010/1) deals with the installation, operation, care, and repair of the B.W. motors and generators; but it will be of interest and value to erectors and users of all such machines. It contains concise and simple directions relating to the subject-matter, including allied considerations, such as lubrication, belts, starters, the causes of sparking, &c., and if carefully studied by attendants should be largely instrumental in prolonging the life and maintaining the efficiency of the machines concerned. It is issued by the British Westinghouse Electric and Manufacturing Co., Ltd., Trafford Park, Manchester.

Messrs. Fawcett & Co., of 125, Strand, London, W.C. 2, announce the preparation of a history of British commercial houses which have been established over 100 years, under the title "Historic Firms of Great Britain and Ireland." They will be greatly obliged if firms coming under the scope of the publication will communicate with them.

Liquidation.—ANGLO-COLONIAL ENGINEERING CO., LTD. —General meeting to be held on September 29th to hear an account of the winding-up from the liquidator, Mr. G. E. Corfield.

LIGHTING AND POWER NOTES.

Australia.—The newly-incorporated Borough of Sandringham (Vic.) has already decided to install electricity for lighting and power purposes. At the last meeting of the Council the Mayor reported that he had interviewed the Melbourne Electric Supply Co. and suggested that it should extend its mains or supply the Council with electricity in bulk. The company stated that it was prepared to extend the mains to the Black Rock railway terminus, where a transformer station would have to be erected to permit of the neighbourhood being served, but at present the company was faced with a shortage of cable, &c. With regard to the extension to Beaumaris, it would not be possible to undertake that work until after the war; in addition, it would be necessary to obtain permission to supply that district, for which it was about to apply. It was decided that the matter should be deferred for further consideration. *Tenders.*

The Melbourne Harbour Trust proposes installing mechanical coal-handling plant capable of dealing with 400 tons of coal per hour; the present rate per hour of handling by man power is 60 tons. Tenders are to be invited for both steam and electrically-operated appliances (those electrically-operated being preferred), of which not less than two, or more than four, are to be employed to obtain the total output.

Mr. T. Murray, the engineer to the Victorian State Rivers and Water Supply Commission, is to furnish a report on the proposal of the Yea and Mansfield Dairy Co. to supply electric power for pumping water to the township of Yea. *Tenders.*

Canada.—The report of the Toronto hydro-electric system for the year ended December 31st shows a gross income of \$1,706,177, and after deducting working expenses, a gross surplus of \$634,042; interest, depreciation, and sinking fund charges absorbed \$615,646, leaving a net surplus of \$18,396. The report states that the gross income is 53 per cent. in advance of that for 1915. Mr. H. H. Cousins, the general manager, states that the total kw.-hours sold in 1916 were greater than in 1915 by approximately 27 per cent.; the total revenue shows an increase of 6 per cent., in spite of rate reductions; the total number of private consumers is 43,160, with a connected load of 70,500 KW.; the capital expenditure amounts to \$6,300,000; the sustained 20-minute peak load on December 4th, 1916, was 47,165 H.P.; the average revenue per kw.-hour for the whole system was 1.2 cents in 1916, as compared with 1.41 in 1915; the total number of kw.-hours sold was 139,000,000 in 1916, as compared with 109,000,000 in 1915 and 83,000,000 in 1914. Notwithstanding these heavy increases, the total cost of operation and maintenance has decreased from \$550,000 in 1914 to \$548,000 in 1915 and to \$543,000 last year. An item of interest, as indicating the extent to which the customers of the Toronto hydro-electric system are utilising electrical

appliances of various kinds, is that, excluding lamps, 18,500 articles were sold from the hydro-electric showrooms, an increase of more than 30 per cent. over the previous year. The balance-sheet now shows total assets for the Toronto hydro-electric system of \$8,882,171, made up roughly as follows:—Fixed assets, \$7,501,186; stores in hand, \$125,259; accounts recoverable, \$241,461; capital funds in hands of city treasurer and cash in bank, \$710,141. The report states that the necessary amounts have been set aside for interest, depreciation, and sinking funds, in accordance with the regular policy of the Commissioners.—*Canadian Electrical News*.

Continental.—SPAIN.—A concession has lately been granted for the establishment of a plant to utilise the water power of the River Mijares near Montargis (Province of Castellon) in the generation of electrical energy for power purposes.

Dundee.—The Electricity Committee has refused a request for compensation by the Yorkshire Henebique Co. in respect of a contract entered into in May, 1915, in regard to which it was contended that a serious loss was incurred through the increased cost of labour and materials.

Finchley.—PROPOSED EXTENSION.—At the last meeting of the U.D.C. it was announced that an increase of plant was necessary to the electricity undertaking, at a cost of £14,000. Permission to proceed with the proposed scheme had been refused, and a new one was being prepared.

Great Harwood.—PROVISIONAL ORDER.—The B. of T. has agreed to the request of the U.D.C. for an extension of the Electric Lighting Order, the date now fixed being August 7th, 1918.

Halifax.—WAGES.—The Committee on Production has made an award of a 9s. per week advance on pre-war rates of pay for the semi-skilled employees of the Corporation—to the number of about 500. The men demanded 12s.; the Corporation offered 8s.

London.—MARYLEBONE.—The annual statement of accounts of the B.C.'s electricity undertaking for the year ended March 31st last, shows a gross revenue from sales of electricity amounting to £185,465, as compared with £174,753 in the previous year, being an increase of 6.13 per cent. The average price decreased by .09d. per cent. from 2.74d. to 2.65d. per unit. The total revenue amounted to £214,170, while working, management and establishment expenses accounted for £105,790, leaving £121,444 to be carried to net revenue account, which, with bank interest, totalled £121,716. Interest charges and loan instalments absorbed £114,753, and the net profit on the year's working was £6,963. During the year the final instalment of one of the short period loans was paid off, relieving this year's account of £4,740, and the ensuing and subsequent years of £5,358 per annum; another loan will be fully liquidated during the present year, which will further reduce the loan service charges by £850. The revenue, surplus and appropriation account at March, 1916, showed a balance of £13,917, which, with this year's net profit added, made a total credit of £20,880; of this £2,936 has been expended on new meters, mains, services, &c., other improvements accounted for £1,761, and after providing for depreciation of fittings on hire, there is a surplus carried forward of £14,582. During the year 17,617,146 units were sold, as compared with 16,069,870 in the previous year; the total works cost per unit sold being 1.216d., and the total all-in costs 2.773d.; the total average price obtained was 3.009d. The maximum load was 9,737 K.W., and the load factor 20.7 per cent.

London Electricity Supply Conference.—At a conference recently held between the L.C.C. Special Committee on London Electric Supply and representatives of the City Corporation, Metropolitan Borough Councils, and the London Electric Supply Companies, upon the question of the electricity supply in London, the following resolutions were passed:—1. That, in the opinion of this Conference it is desirable that, before formulating a scheme for the electricity supply of London, the L.C.C. should consult the Metropolitan Borough Councils owning electric undertakings, the Metropolitan Borough Councils not owning electric undertakings, the City Corporation, and the London Electric Supply Companies. 2. That, in the opinion of the Conference, it is desirable that Metropolitan Borough Councils owning electricity undertakings, Metropolitan Borough Councils not owning electricity undertakings, and the various companies should appoint a Committee, or Committees, to confer with the Electricity Committee of the County Council.

Llandudno.—The Urban Council has decided to engage Mr. W. H. Patchell to report on the Council's electricity undertaking in relation to the supply of energy to the Light Railway Co. and on the economical working and the undertaking generally.

Mytholmroyd (Yorkshire).—Some time ago the D.C. declined to agree to an intended application by the Electrical Distribution of Yorkshire, Ltd., for a prov. order, and has since arranged with the Halifax Corporation to provide electricity. The Council, at its recent meeting, received a letter from the Power Co., stating that the Halifax Corporation had applied to it for a supply of electricity for Mytholmroyd consumers, and that the company had agreed to provide it; but for the war, it was added, the main would by now have been extended to Mytholmroyd.

Radcliffe.—YEAR'S WORKING.—The engineer's report shows that for the year ended March last the electricity undertaking had a total income of £12,793, an increase of £2,516 on the previous year, while the gross profit was £1,292, after providing £373 for meters and war allowances; deducting interest and sinking fund charges, the net surplus was £251, as against a deficit

of £176 in the previous year. Some 2,150,000 units were sold, as against 1,764,000 in the previous year; the department generated 1,056,000 units, and purchased 1,533,000 units in bulk from the Bury Corporation, the joint coal and bulk supply costs being .467d. per unit sold. During the year a three-phase supply for textile driving has been inaugurated.

South Africa.—The Cape Town T.C. has made arrangements with the Cape Town Tramways Co. for a temporary supply of 200 to 300 K.W., to be taken at the Council's convenience, so long as it does not interfere with the tramway service, the Council to carry out all necessary work at the power station, and to provide suitable meters.

The Paarl (Cape Province) hydro-electric lighting installation was recently opened; the lights were switched on by the Mayoress, this being the signal for the firing of a seven-gun salute.

Warrington.—YEAR'S WORKING.—The accounts of the electricity undertaking show that the income during the past year amounted to £41,203 and the expenditure to £28,577, leaving a gross profit of £12,626. Loan charges and bank interest, less interest received, absorb £8,455, leaving a net profit of £4,171, as against £2,395 in the previous year.

TRAMWAY AND RAILWAY NOTES.

Belfast.—With reference to the views expressed by our correspondent in this column in our issue of the 10th inst., we gather from Mr. J. S. D. Moffet, general manager of the Corporation Tramways, that these are not in agreement with the facts, as regards fare revisions and extensions of the system. He states that the new fare scheme put into operation in May last has given an additional revenue of £8,000—a much bigger increase than was expected—and that its success is admitted. As regards the extensions, no new ones have been opened since 1912, so that they cannot be called recent. It is also untrue to say that certain routes are being run at a dead loss to the ratepayers, the difficulty being how to increase the services and so remove the grievance of overcrowding. Mr. Moffet further urges that, in any case, tramway facilities cannot be confined within artificial boundaries, in which we fully agree with him.

According to the *Belfast News-Letter*, Mr. Moffet recently reported on the working of the tramways during the four months ended July 1st, from which it appeared that the total revenue was £108,204, as compared with £100,287 for the corresponding months last year. Due to additional expenditure, and after allowing for fixed charges, there was, however, a deficit of £1,981 for the period mentioned.

Bolton.—WAGES.—The Tramways Committee has received an application from the Lancashire District Council of Tramway Workers for an advance of 7s. 6d. per week for all the members 18 years of age and over, including motormen, conductors, inspectors, and general staff. The Committee resolved that the application be not acceded to, but that the matter be referred to the Committee on Production for decision, and also that various other matters raised by the Association at an interview with representatives of tramway authorities on August 2nd, relative to the method of paying war bonus and payment of bonus for overtime should be embodied in such reference, with a view to the decision of the Committee on Production being obtained thereon.

Brighton and Hove.—The B. of T. has granted an extension of time for the completion of the overhead equipment of the Brighton, Hove and District railless traction system, for one year from August 7th, 1917.

Dover.—ACCIDENT.—A crowded Corporation car descending Crabble Hill, on Sunday, got out of control, and finally collided with a wall and overturned, 10 people being killed and 35 injured. The driver jumped clear as the collision occurred, and escaped with minor injuries; the conductress was killed.

Dunfermline.—Following upon the appointment of Sir Eric Geddes as First Lord of the Admiralty, the construction of the tramway line between Dunfermline and Rosyth will be begun in the immediate future.

Edinburgh.—INCREASED FARES.—The Edinburgh and District Tramway Co. has decided to raise the fares. The company, it is stated, has been compelled to take this step in view of the refusal of the Corporation to reduce the rent. In a statement regarding the increased expenditure, Mr. J. R. D. Cox, general manager of the company, says it is highly probable that the cost of materials will further increase. In fact, the cable makers have already advised a further increase of £12 a ton, making a total increase in price since 1914 in this important item of 73 per cent.

Halifax.—HOLIDAY TRAFFIC.—The Corporation tramways experienced a time of great prosperity during the local "Wakes" week, which is the week following Bank Holiday week. The receipts during the four days, Saturday to Tuesday, were £2,341, as compared with £1,910 during the same period last year.

Huddersfield.—FREE RIDES.—The T.C., last week, agreed that members of the local Volunteer Force be permitted to travel on the cars at half fares when in uniform. An amendment that the recommendation be referred back was defeated. It was mentioned that 11,000 wounded and other soldiers travel free weekly on the local tramways.

Rochdale.—The Tramways Committee has decided to renew the overhead equipment between Heybrook and Little-borough.

Swinton.—At a meeting of the D.C., last week, it was announced that the South Lancashire Tramways Co. had refused to reopen the question of tramway service in the Swinton district. It was understood that it was going to revise the whole of the stages, but would not consider the question of transfer tickets at Swinton.

U.S.A.—The New York, New Haven, and Hartford Railway intends to reduce its schedule by 199 passenger trains a week, in compliance with national defence plans, and with a view to movements of troops and supplies. The Boston Elevated Railway has inaugurated a tank-car haulage system for transporting molasses during off-peak hours. A maximum of 12 tank cars have been filled, hauled, and emptied in one night, the distance being two miles, and the charge being equivalent to 18 cent per gallon as against 3 cent for team haulage when 13 trucks were employed.—*Electric Railway Journal*.

The four Chicago traction Bills, which would have enabled an extensive reorganisation of the city's transportation system to take place, have been shelved by the State Legislature until its next meeting, which may not be for two years.

West Riding Holidays.—A Yorkshire correspondent states that the high railway fares and the spread of tramways all over the West Riding of Yorkshire and Lancashire have resulted in large numbers of people from the West Riding cities and towns adopting, this summer, the comparatively new method of reaching Blackpool and other Lancashire holiday resorts by tramway. There are various routes from different industrial centres, but they mostly converge when over the border, and utilise the Preston tramway system as the final "jumping off" place in getting clear of industrial environment. Practically all the routes involve an occasional walk between the termini of different towns' systems, but, despite the repeated changing and transference of luggage by hand and the length of the journey, an increasing proportion of workers are realising the huge saving which can be effected in travelling costs. Many people from Bradford and Halifax, during the general holiday period last week, were grievously inconvenienced in utilising the Keighley way over the county border, by finding that the Keighley railless service from the tramway terminus did not commence until nearly mid-day.

TELEGRAPH AND TELEPHONE NOTES.

Federated Malay States.—During the past year 410,641 telegrams were dispatched and 451,417 received for delivery, an increase of 138,014. There are 2,210 miles of telegraph and telephone line in the country and 10,461 miles of overhead wire, of which 7,914 miles are telephone wires. In addition, there are 26½ miles of underground telephone cables, containing 2,413 miles of wire, single line.

Mexico.—After a lapse of several years, telegraphic communication has been re-established between Mexico City, Mexico, and the State of Yucatan.—*T. and T. Age*.

Secret Wireless Station.—Men of the Argentine Navy have discovered, on the coast of Chubut, Patagonia, a secret wireless installation. The authorities have seized the plant. It is thought that the station was used to communicate with suspect vessels in the South Atlantic.—*Birmingham Daily Post*.

United States.—The Government is making such heavy demands for telegraphists all over the country that the situation is assuming a serious aspect. The telegraph and telephone companies are experiencing very large increases of business, and it is with difficulty that they can keep up their own supply of working forces, let alone meeting the requirements of the Government. Approximately 6,000 telegraphists will be taken to secure the required strength of the Signal Corps department of the first military unit of 500,000 men: each succeeding unit of the same size will require 4,000 more.—*T. and T. Age*.

U.S. Telephones.—During the year 1916 the daily average of telephone calls in New York City was about 29,420,000. The Bell Telephone system in the United States on May 31st owned 20,870,194 miles of wire, compared with 18,905,218 at the same time in the year 1916, and 10,256,068 connected stations, compared with 9,463,800.—*T. and T. Age*.

CONTRACTS OPEN AND CLOSED.

OPEN.

Australia.—MELBOURNE.—October 10th. Department of the Navy. Pumping plant and equipment for the Commonwealth Naval Dockyard, Cockatoo Island, Sydney. Specifications from the Director of Navy Contracts, Melbourne.

Kettering.—August 28th. Electricity Department. Supplying and laying 751 yards of lead-covered cable, with three-core pilot; feeder pillar, dividing boxes, switchboard instruments and stoneware troughing. See "Official Notices" August 17th.

London.—BERMONDSEY.—Sept. 7th. B.C. 500-KW. rotary converter. See "Official Notices" August 3rd.

New Zealand.—The Public Service Stores Tender Board, Wellington, N.Z., invites tenders up to 4 p.m. on September 5th, for the supply and delivery of (1) 30,000 dry cells for telephones; (2) 3,000 cords, 4 conductor; and 2,000 diaphragms for watch receivers; (3) 15,000 swan-neck insulator bolts and 20,000 cups to fit these bolts; and (4) 3,135,000 envelopes of various kinds. The conditions of tender, &c., may be consulted by British manufacturers at the Department of Commercial Intelligence, 73, Basinghall Street, London, E.C. 2.—*Board of Trade Journal*.

Portsmouth.—August 28th. Tramways Committee. Six months' supply of engine-room stores, insulating material, &c. See "Official Notices" August 10th.

Rathmines.—August 29th. U.D.C. 500 tons of coal for the electricity works. Particulars from the Electricity Department.

Spain.—The municipal authorities of Cáceres have just invited tenders for the concession for the electric lighting of the town. Tenders have also lately been invited for the concession for the electric lighting of the town of Ferrol (Province of Coruna) during a period of 15 years.

The Spanish Post and Telegraph authorities in Madrid have just invited tenders for the supply of about 12 km. of telephone cable.

CLOSED.

Glasgow.—The Tramways Committee recommends acceptance of the following offers:—

Special trackwork.—Haddfields, Ltd.
Traction lamps.—Edison Swan Electric Co.; General Electric Co.
Steel pinions.—A. Wiseman, Ltd.
Gear-cases.—Equipment & Engineering Co.

The following tenders for plant at Dalmarnock generating station were recommended for acceptance by the Electricity Committee:—

Fraser & Chalmers.—One 500-kw. turbo-alternator, £6,180.
British Westinghouse Co.—One 500-kw. turbo-alternator, £6,300.

For static transformers for sub-stations:—
British Electric Transformer Co.—16 transformers, £1,932 each.
Ferranti, Ltd.—16 transformers, £1,924 each.

Government Contracts.—List of new contracts placed during July, 1917:—

WAR OFFICE.

Electric bells.—W. Maxwell & Co., Ltd.; J. Sax & Co., Ltd.
Practice buzzers.—Edison Swan Electric Co., Ltd.
Generating sets.—Aster Engineering Co. (1913), Ltd.; O. Stott, Ltd.
Terminals.—Ingram & Kempe, Ltd.
Copper wire.—B.I. & Helsby Cables, Ltd.; Shropshire Iron Co., Ltd.; F. Smith & Co., Ltd.
Works services.—Installation of electric power: Edmundson's Electricity Corporation.

POST OFFICE.

Protective apparatus.—L. M. Ericsson Manufacturing Co., Ltd.
Telegraph apparatus.—I.R., G.P. & Telegraph Works Co., Ltd.
Telephone apparatus.—British L. M. Ericsson Mfg. Co., Ltd.; Gent & Co., Ltd.; Peel-Conner Telephone Works, Ltd.; Siemens Bros. & Co., Ltd.; Western Electric Co., Ltd.
Telegraph cable.—Craigpark Electric Cable Co., Ltd.; Fuller's Wire and Cable Co., Ltd.; General Electric Co., Ltd.; Johnson & Phillips, Ltd.; New Gutta-Percha Co., Ltd.; Union Cable Co., Ltd.; Western Electric Co., Ltd.
Telephone cords.—B.I. & Helsby Cables, Ltd.
Insulators.—Bullers, Ltd.
Jointing sleeves.—C. M. Powell Bros.
Solder.—B.I. & Helsby Cables, Ltd.
Insulator spindles.—Bullers, Ltd.; Guest, Keen & Nettlefolds, Ltd.; C. Richards & Sons.
Bronze insulated wire.—B.I. & Helsby Cables, Ltd.

Leigh (Lancs.).—Tramways and Electricity Committee. Accepted tenders:—

Wigan Coal & Iron Co., Ltd.—2,500 tons fine slack (Priestner's), at 11s. 6d. per ton; 1,200 tons rough slack, at 15s. 6d. per ton; and coke dust, at 6s. per ton, delivered.
Astley & Tyldesley Collieries, Ltd.—Engine fuel, at 15s. 9d. per ton, delivered.

NOTES.

The Channel Tunnel.—In the House of Commons, last week, Mr. Fell asked the Prime Minister if he could now say if the Government was in favour of the construction of the Channel Tunnel, and would support the Bill when introduced to give the necessary powers. Mr. Bonar Law replied:—The Cabinet have again carefully considered the question in consultation with their naval and military advisers, and they are still of the opinion that it is not practicable to proceed further with the matter during the continuance of the war. In these circumstances, it would not be possible for the Government to support a Bill of the nature indicated in my hon. friend's question.

Educational.—SOUTH-WESTERN POLYTECHNIC, CHELSEA, S.W. 3.—The college will re-open on September 24th, for day and evening classes. Students are prepared for the London University B.Sc. degree in engineering, for the examinations of the engineering institutions, and those of the City and Guilds of London Institute. The evening courses also include classes in aeronautics and electrical installation work. In the electrical installation department, an advanced course has been arranged for the preparation of candidates for the final examination of the City and Guilds of London Institute. Arrangements have been made for placing students who have passed satisfactorily through the three years' day course in positions with large engineering firms, and hitherto such firms have offered more vacancies than the Institute has been able to fill with its students. Further particulars can be obtained on application to the secretary.

ROYAL TECHNICAL COLLEGE, GLASGOW.—Particulars of the diploma and degree courses in Engineering, &c., for the new session (which begins on September 25th) are advertised in this issue.

UNIVERSITY OF LONDON.—At a recent meeting, the Senate approved a memorandum, which has been forwarded to the Treasury, the Board of Education, the Civil Service Commission, the Government Committee on Science, and the Royal Society. It sets forth, in the first place, that education till the age of 16 should be general and not specialised, and should embrace not only literary, but also scientific studies. In the second place, it is laid down that natural science—including physics and chemistry—should be compulsory in all secondary schools.

In addition to the ordinary secondary schools, the Senate also desires that special technical day schools in accordance with local needs should be established in all industrial centres for boys and girls between 13 and 16 years of age who wish to enter technical industries at the age of 16. These schools would apparently form an exception to the general principle laid down, that education under the age of 16 should not be specialised.

The Senate in its memorandum next states that, in order to secure for science teaching the position to which it is entitled and which for the benefit of the nation it ought to occupy, the schemes under which the great public schools are administered should in each case contain provisions to the effect that:—(a) The governing body shall include a substantial number of representatives of the learned and scientific societies; and (b) that members of the governing body shall not hold office for life.

Without such provisions it is probable that men distinguished by mathematical and scientific attainments will continue to be at a disadvantage in applying for appointment to headmasterships of public schools. Greek should not be a compulsory subject for entrance scholarships to these schools, and adequate facilities, including equipment, for learning science should be available for, and accessible to, all their pupils.

Almost all the headmasterships of the great public schools are held by those who have taken classical degrees, and consequently in the schools in question science is relegated to an inferior position. In the few cases where a mathematician or scientist is headmaster, and science is well taught, the schools are so full that it is almost impossible for boys at the present time to gain admission.

Specialised first degrees in science at a university are deprecated in the memorandum. It is held that a student should first obtain a general degree in science, and then specialise in some branch of science or in the application of science to industry. This is probably the ideal training, but the question of time is of importance, and it may be found in practice that few, without valuable scholarships, can undertake such a lengthened course of study.

The Civil Service examinations are next considered, and the Senate suggests that the present arrangement for the selection of first division clerks in the Civil Service should be modified so that on every occasion an adequate proportion of those appointed must have had mathematical or scientific training. In all selections for the higher administrative posts for the Government Departments, the work of which is of a scientific or technical character, the official selected ought to have received such a scientific training as will fit him to understand the character of the work for the organisation of which he will be responsible.—*Daily Telegraph*.

Books for British Prisoners of War.—Excellent work is being done in the way of enabling British prisoners of war usefully to employ their time during internment by Mr. A. T. Davies, C.B., of the Board of Education, chairman of the British Prisoners of War Book Scheme, the war charity which provides British prisoners interned in enemy or neutral countries with books for study purposes. Through the instrumentality of the organisers of the book scheme arrangements have been made, and in some cases have been in operation for a considerable time, whereby examinations have been held at a foreign camp, of those students who have been desirous of taking their examinations notwithstanding their internment. Increasing use, too, is being made by the prisoners of the "Form of Record" prepared by the Committee of the Book Scheme, which enables the regular studies in any subject of a "Student Captive" to be duly recorded and certified with a view to the record assisting him on his return from captivity at the close of the war. Contributions in aid of the scheme are urgently needed. In the technical and scientific sections the prisoners' demand for books is very large, but the works asked for are rarely obtainable as gifts, as the owners generally need them for their own use, while second-hand copies, sufficiently up to date, are proving increasingly difficult to procure. In these circumstances, the Committee is compelled to make large purchases of

new copies of up-to-date books of the above character, and, for this, ample funds are essential. Offers of books (which should always be accompanied by a detailed list) are also invited, and should be addressed to Mr. A. T. Davies, C.B., "Prisoners of War," Board of Education, Victoria and Albert Museum, South Kensington, S.W. 7.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel C. B. Clay, V.D., commanding:—
Office for the Week.—Platoon Commander C. Campbell.

Monday, August 27th.—Technical instruction (searchlight) for No. 3 Company, Right Half Company, at Regency Street, Drill, No. 3 Company, Left Half Company. Signalling Class. Recruits' Drill, 6.30.

Tuesday, August 28th.—Lecture, 6.30. Physical drill and bayonet fighting, 7.30.

Wednesday, August 29th.—Drill and elementary bridge construction for No. 1 Company, Right Half Company.

Thursday, August 30th.—Drill and elementary bridge construction for No. 2 Company, Right Half Company. Ambulance Class.

Friday, August 31st.—Technical instruction (searchlight) for No. 3 Company, Left Half Company, at Regency Street. Drill, No. 3 Company, Right Half Company. Signalling Class. Recruits' Drill, 6.30.

Musketry.—All N.C.O.'s and men who have signed the "A" and "B" agreements are required to attend during this month to reclassify in order to enable the corps to obtain the capitation grant. Preference will be given to those men in firing.

(By order) MACLEON YEARSLY.

TYNESIDE VOLUNTEERS.—A joint meeting of the electrical section of the Newcastle-upon-Tyne and Gateshead Chamber of Commerce and the Local Section of the Institution of Electrical Engineers was held on the 14th inst., at Newcastle, Mr. H. W. Clothier presiding. It was in relation to the raising of certain specialist units for the Durham and Northumberland County Volunteer Regiments. The units required were signal companies and electric light companies for what will become the County Engineer Corps. The suggestion was to raise two electric light companies south of the Tyne, one north of the Tyne, and one in the Hartlepool area of Durham; and one similar company at Newcastle, one at Tynemouth, one at Blyth, in Northumberland. It was proposed to form one signal company for Durham, with six sections centred at, respectively, Gateshead, South Shields, Sunderland, Hartlepool, Stockton, and Darlington. The sections of the Northumberland Company would be located two at Newcastle, one at North Shields, one at Blyth, and one at Morpeth. The establishment of an electric company was put at £7, and of a signal company headquarters section 38, and of other sections at 24.

The Chairman said the whole industry was alive to the necessity of moving with the times, and it was most essential for the individual members themselves to take an active part in such movements. He said they were being approached in various matters, and instanced the action of the Electrical Section of the Chamber of Commerce with respect to the giving of evidence before the Board of Trade Electrical Committee on the development of power stations. The matter before them that night was one which concerned them individually.

Col. W. C. Blackett, County Commandant, Durham Volunteer Regiment, said there was real need for the appeal they were making to raise those units for the Volunteer Regiments, to have them ready for any emergency that might arise. They had twelve battalions of infantry, and engineering corps (in which the signalling and electric light corps would be included), artillery, transport and medical corps were being raised. They had hopes of raising two companies of the electric light corps at Hartlepool, and wanted two at Tyneside. As to the signalling companies they had three movements under way which they hoped would bear fruit.

Captain Barnes laid stress upon the urgency of the matter, and gave details as to the formations, emphasising the importance of the signalling companies, upon which matter Capt. Worsley also spoke. The latter stated that a very important part of the work of the signalling company was to deal with field telephones, and there would be also motor cycle sections.

The Chairman moved: That this meeting representing the electrical industry of Tyneside give the appeal their heartiest support. Mr. Lunn seconded and the motion was carried.

As the outcome of the above meeting, the following preliminary arrangements have been made for the Durham area:—Mr. H. W. Clothier, of Messrs. A. Reyrolle & Co., Hebburn-on-Tyne, will confer with Mr. Pyne, of Palmer's, Hebburn, with a view to raising an electric light company for that district. From Hartlepool Engine Works, under the direction of Mr. D. B. Morison, two electric light companies will be formed, and the names of 150 men have been sent to the County Territorial Association. There are also 21 men for the signalling section awaiting word from headquarters to commence training. In connection with the Horden Coal Co., South Shields, a signalling section is proposed, Mr. H. S. Ellis, borough electrician, acting as organiser. At Sunderland, Mr. Windle proposes to co-operate with local firms with a view to raising a signalling section. At Stockton-on-Tees, Lieut. J. Riley is to co-operate with Messrs. Riley Bros. in raising a signalling section. In regard to the county of Northumberland, it is stated that the Newcastle Electric Supply Co. are raising a special unit amongst their men in connection with their own plant. This unit would engage principally those in the operating department, and other members of the staff may be available to co-operate with consulting engineers with a view to raising a signal section in Newcastle. Members have already signed on for different units.

Any gentleman or firm, who was not able to be present at the meeting and who is interested in the movement, is asked to communicate with Mr. Herbert Shaw, Secretary, Newcastle Chamber of Commerce.

National Insurance (Unemployment) Acts, Unemployment Insurance.

The Umpire has decided that contributions are payable in respect of:—

2,372 X. A steam-hammer forger engaged in making copper refining ladle plates and rabble heads and light forgings for use in copper, spelter, and steel works.

2,375 X. Workmen engaged in screwing tubes.

2,377 X. Workmen engaged wholly or mainly in making metal laths.

2,378 X. Workmen engaged in corrugating and curving galvanised metal sheets.

2,380 X. Workmen engaged wholly or mainly in the manufacture of accumulator cell boxes or of lead linings for such boxes.

2,381 X. Workmen engaged in making wrought or welded iron pipes for use as telegraph poles.

2,383 X. Workmen engaged wholly or mainly in making and fitting together wrought-iron parts of small forges for heating rivets.

The Umpire has decided that contributions are not payable in respect of:—

2,369. Switchboard attendants and workmen engaged wholly or mainly in minding, tending, or driving electrical machinery in connection with uninsured trades.

2,373. Joiners engaged wholly or mainly in making by hand wooden drums for electric cables.

2,384. Workmen engaged wholly or mainly in making vulcanised fibre parts of electric light fittings which are not intended for use in war.

Tribute to Samuel Insull.—Officers and directors of the Commonwealth Edison Co. celebrated the twenty-fifth anniversary of Samuel Insull's presidency of the company and its predecessors by giving an "Edison Family Birthday Party," on June 25th.

In an address acknowledging the tributes, Mr. Insull reviewed the gigantic growth of the company and its predecessors, as well as of the other corporations composing what is commonly called "the Insull group." These companies have an aggregate capital of \$445,000,000, and the gross annual turnover is \$75,000,000. On the average, this shows that the companies turn over their capital about once in six years. The companies pay a little less than \$5,000,000 in taxes, and serve 1,500,000 customers living within an area of between 58,000 and 60,000 square miles. They have between 20,000 and 25,000 employes.—*Electrical World*.

Commercial Intelligence Service.—Lord Robert Cecil and Sir Albert Stanley are submitting to the Commercial Committee of the House of Commons a new scheme for a Commercial Intelligence Service. The suggested arrangements have been approved by the Cabinet. An emergency meeting of the Committee has been convened to consider the scheme.—*The Times*.

Inland Water Traffic.—The Canal Control Committee has issued a letter directing the attention of manufacturers, merchants, and others to the desirability of using the inland waterways of the country for the conveyance of goods of all kinds. The letter points out that the principal object for which the Canal Control Committee has been appointed is to relieve the traffic on the railways by increasing the amount carried on canals.

Since the beginning of the war, both the canal companies and the carriers on the canals have lost a considerable number of their employes, but the Committee is taking steps to provide crews for as large a number of boats as possible, and it is hoped that a greater number of boats capable of carrying traffic will be available at an early date.

The A.E.S.E. and Central Station Staffs.—As we go to press we have received the following letter:—

"Staff," that magic word, I notice has occurred with remarkable frequency of late in various articles and correspondence anent electrical station engineers appearing in the REVIEW.

The "staffs" of electrical stations are apparently realising that they have had no say in the scheme of things, where those employed in stations not on the staff have had a great deal to say through their organisations, and have influenced to some extent Acts of Parliament, war bonuses, &c.

The liberty of action of the staffs has been curtailed by Acts of Parliament and Regulations agreed to by organisations of employes not on the staff.

Staff engineers of this country must rouse themselves: they must strengthen existing staff organisations, and must be prepared to subscribe to these organisations an amount yearly at least equal to that subscribed by a member of a skilled Trade Union. They can then, at least, be on an equal footing with employes not on the staff with regard to influencing regulations concerning their employment.

The Government does not deal with individuals: it now invites representatives from various organisations when some new regulation with regard to any industry is proposed.

It is certain that the time will shortly arrive when vast new regulations will be made to regulate the transition from munitions of war manufacture to reconstruction and ordinary peace industries.

Only those men who are organised will have any say in the matter. Fitters, wiremen, and labourers are organised, and have been consulted on various matters appertaining to their employment. The staff engineers must organise, if only to preserve their position.

Will they take the opportunity before it is too late?

W. J. EBBEN, Hon. Secretary A.E.S.E.

26, Little Park Gardens, Enfield.

August 20th, 1917.

Fatalities.—A collision between a taxicab and a motor-wagon at Aspley, Huddersfield, on Thursday last, resulted in injuries to Lance-Corporal Edward William Chinn, of the Royal Engineers—formerly a driver on the Huddersfield tramways—from which he died later in the day at the infirmary. Verdict, "Accidental death."

Arthur Suthers, aged 28, an electrician employed by the Cleveland Bridge and Engineering Co., at Darlington, was working on a platform of a travelling crane, on Saturday, when he was knocked off accidentally and fell 30 ft. to the ground, receiving fatal injuries.

Leaving Certificate Case.—At Oldham Munitions Court, an electrician employed at a local electrical engineering establishment applied for a leaving certificate. He said he was asked to do "navy's work" to get through a 2-ft. wall, in order to wire a private office, and he was not going to do it. He received 17s. 5d. for a 49½-hour week, which, he said, was not the standard rate. He was not on war work, though he had been previously, and he had been offered a post at Sheffield. The representative of the firm said they were not on munitions, and so could not grant a leaving certificate. The President said the Court had no sympathy with the plaintiff, and, in granting the certificate, they wished to remind him to be careful, or he might have to prefer the trenches.

Textile Research.—In their annual report, the Tootal Broadhurst Lee Co. announced that "assured of the importance of research and education in the struggle for the world's trade, the directors have decided to set aside £10,000 for five years for this purpose." The Provisional Committee on Research and Education for the cotton industry will, at the close of the current holiday season, issue a prospectus of the new Government-incepted and aided organisation. This definite industrial research federation of the cotton trade will be followed by the establishment of institutes and laboratories.

The Anchor Hospital and Distress Fund.—The sixth annual general meeting of members of the Hospital and Distress Fund, in operation at the Anchor Cable Works, Leigh, was held on August 16th. There are three separate funds in existence, and the balances standing to the credit of these funds at June 30th, 1917, were as follows:—

The Hospital and Distress Fund	...	£210	2	1
The Belgian Refugee Fund	...	108	13	6
Special War Fund	...	339	14	0
		£688	9	10

The parent Hospital and Distress Fund has for its objects:—

(a) The granting of annual sums to hospitals and convalescent homes, &c., thereby ensuring to members hospital treatment in case of accident or other sickness.

(b) The granting of temporary relief to members in exceptionally distressed circumstances, so that shop collections may be discontinued.

All the employes in the works and offices at Leigh, aged 17 years and over, are members, and contribute according to their means sums varying from 1d. to 8d per week.

The Committee of the Fund is responsible for the administration and distribution of the allowances made by the firm to dependents of members who have joined His Majesty's Forces, and is also responsible for the maintenance of a Belgian refugee family. From the special war contributions of members parcels of comforts and cigarettes and tobacco are regularly sent out to the firm's employes on active service, and during the 12 months ended June 30th last a total sum of £210 was distributed amongst the various local and national war funds. At the general meeting it was decided to make grants amounting to more than £200.

It should be added that the good work of the Fund could not be continued were it not for the generous assistance rendered by the directors and management of the company—Messrs. Callender's Cable and Construction Co., Ltd., of London and Leigh.

Competition for Electric Cookers.—According to the *Génie Civil*, the Société Générale Italienne d'Electricité Edison has opened a prize competition for the construction of an electric cooking outfit of the thermal storage type, designed to consume as little energy as possible, and to spread the daily demand over the longest possible period, the criterion being the ratio between the consumption in kw.-hours and the maximum demand in kw. The conditions are that before March 31st, 1918, at least three samples shall be submitted, suitable for a family of five or six persons, as well as particulars of smaller and larger sets. The Société Edison has placed 10,000 lire (£400) at the disposal of a commission for distribution in the form of one or more prizes.

Munitions and Labour.—The Minister of Munitions, accompanied by officials of the Ministry of Munitions, Admiralty, and Ministry of Labour, met representatives of the Engineering and Shipbuilding Trades Federation in the Central Hall, Westminster, on August 22nd. He explained to them that the principal object of the meeting was to set up an advisory committee of trade unionists, the appointment of which had been discussed at previous conferences. The delegates indicated that they had every intention of helping him in his work. Their proposals as to the membership of the advisory committee were handed to the Minister in the course of the afternoon.—*Daily Telegraph*.

Patents and Alien Enemies.—Licences have been granted by the Board of Trade to the Chesham Supply Co., Ltd., in respect of 10 patents granted to Simms and Robert Bosch.

A Large American Loan Issue.—The *Electrical World* states that the General Electric Co., of Schenectady, has arranged a loan of \$15,000,000 for three years, to provide for the demands of a largely increased business. The company expended nearly \$9,000,000 on additional plant facilities in 1916, and will spend much more this year. The live assets of the company, as shown by its last annual report, excluding securities, amounted to \$97,000,000, and the indebtedness, excluding current liabilities, to \$12,000,000. The new issue was made at 6 per cent. to Messrs. J. P. Morgan & Co. and Lee, Higginson & Co. The subscriptions are said to have aggregated \$80,000,000.

Removing Rust by Electrolysis.—An electrolytic process of deoxidisation has been patented in the United States. The object to be treated is made the cathode in an electrolyte containing phosphoric acid. In addition to its normal function of carrying the current, this acid acts as a solvent upon rust without attacking the steel or iron body beneath. It is in this last detail that its chief availability lies, since nitric, sulphuric, or hydrochloric acid would not display such moderation. Finally, the phosphoric acid is beneficial in preventing subsequent further rusting. The electrolyte is made by adding 10 parts of phosphoric acid to 90 parts of water, or by adding 10 per cent. of the acid to a 10 per cent. solution of sodium phosphate. A temperature between 50° and 70° C. is recommended.—*Scientific American*.

South African Institution of Engineers.—The report of the Council for the session 1916-17 states that, as a result of the work of a Joint Committee formed in 1915-16, a conference of the Councils of the Mining, Electrical, and Engineers' Societies was held in May, which agreed that the time was ripe for the closer working and joint housing of all scientific and technical societies, and a Committee is to be appointed to prepare a scheme. Mr. C. T. Elliott, the secretary, having resigned, Mr. W. R. Jago was appointed in his place. The membership of the Institution numbers 488, a net increase of 25; 72 members are on Active Service or war work. The income was £1,345 and the expenditure £1,585; the capital fund stands at £2,330. At the annual general meeting the president presented the Institution Gold Medal to Lieut.-Colonel J. H. Dobson, D.S.O., for his paper on the Johannesburg electricity works, and referred to his splendid work in German East Africa. Owing to the death of Mr. D. Cullen, the only nominee for the presidency, the election of president had to be deferred to the next general meeting. Mr. Bernard Price, the retiring president, then delivered his valedictory address, dealing mainly with the past year's work, and especially the proposed federation of technical societies on the Rand, which, he believed, was a matter of national importance.

Importation Prohibited.—A Royal Proclamation prohibits the importation, save under licence from the Board of Trade, of all machinery driven by power and suitable for use in operating on wood, including electrical motors up to $\frac{1}{2}$ H.P.

Electrically Equipped Seminary.—A recent issue of our American namesake, the *Electrical Review* of Chicago, contained a description of the electrical equipment of the St. Stanislaus Seminary, near St. Louis. This institution consists of several large buildings, as well as outbuildings, including a bakery, shoe shop, laundry, cannery, cold storage, dairy, pumping station, smith and carpenter's shops, winery, garage and stables, a 900-acre farm being part of the property. To supply it a 13,200-volt line, built with galvanised iron wire, was run 6 miles from the 60-cycle transmission line of the Electric Co., of Missouri, the seminary guaranteeing a connected load of 60 kW.

At the seminary end the line is led into a distribution house, whence 110-volt lighting circuits radiate to the various buildings, underground cable being used. In all 600 lamps of 22,000 watts capacity are installed. For the farm supply two 220-volt underground lines run from the distribution station; one of these supplies a 10-H.P. laundry motor, a 10-H.P. ammonia compressor motor, and a 5-H.P. well-pump motor. A 10-H.P. corn grinder, a 10-H.P. circular saw, and a cream separator motor are also operated. The lighting for the farm buildings is taken off the power supply, up to 20 per cent. of the connected power load.

In the kitchen of the infirmary, a General Electric range is installed, also two 18-in. exhaust fans for use in vacuum cleaning. Heaters are being placed in the rooms and tests are being made for space heating.

The community kitchen is to have an electric bake-oven to bake 100 24-oz. loaves per hour, and an electric range to cook meals for 350 persons. This range will have four large ovens and two broilers to deal with 140 lb. of steak an hour. All vegetables, soups, &c., will be prepared in six electric steamers, and all roasting is to be carried out in a special oven. A plate-warmer, potato peeler, meat and coffee grinders are also included in the equipment.

All water heating for cooking, dish washing and bathing will be done electrically by two 300-gallon heaters which will furnish some 1,000 gallons of water at 180° every 24 hours.

Electrically heated coffee and tea-urns will be supplied with initially heated water from this source. The bakery has been equipped with an electric dough-mixer driven by a 2-H.P. motor, also with three electric baking ovens each with a capacity of 100 24-oz. loaves an hour. The output of two of these ovens has easily equalled the combined rated capacity of all three. In each oven three heats are employed. Previously the brick ovens in use required 24 hours' heating to obtain the proper temperature; with the electric ovens 14 hours suffices. Already well-defined monetary savings are being made over the previous costs.

Appointments Vacant.—Car-shed mechanic (36s.—42s.), for Exeter; shift engineer, Birmingham Corporation; switchboard attendant for the Leek U.D.C. Electricity Works. See our advertisement pages to-day.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—A request has been received by the Dublin Corporation from the Coal Mines Department of the Board of Trade for the part-time services of Mr. LAURENCE J. KETTLE, deputy city electrical engineer. The Corporation has acceded to the request.

The Rochdale Electricity Committee has decided to recommend the appointment of Mr. F. H. RUDD as permanent electrical engineer to the Corporation, at a salary of £400 per year, with a further increment of £50 within 12 months. Mr. Rudd has been the acting engineer since the resignation of Mr. C. C. Atchison.

The Greenock Electricity Committee recommends that the salary of Mr. FRANK H. WHYSALL, the burgh electrical engineer, be increased by £100, which will bring it up to £700.

Mr. W. E. THORP has been appointed inspector on the Doncaster Corporation tramways. He was engaged in the service prior to the war, has been to the Front, and has been discharged as unfit for further military service.

General.—The marriage took place last week, at Erith Parish Church, of Mr. E. J. DAVIS, and Miss Mabel May Vaux, second daughter of Mr. J. H. Vaux, of Callender's Cable & Construction Co., Ltd.

The marriage took place, at Crewe Green Church, last week of Sapper HUBERT SIMPSON, London Electrical Engineers, late of the staff of the Crewe Corporation electricity works, and Miss Melville Alcock, only daughter of Coun. C. Alcock, of Crewe.

At St. Paul's Church, Helsby, the marriage has taken place of Mr. N. GREENING, only son of Mr. N. Greening, of Newlands, Frodsham, and Miss Elsie Brotherton, younger daughter of Mr. J. Brotherton, J.P., manager of the Helsby Cable Works.

Roll of Honour.—Captain ESMOND WILLIAM MILNES, R.G.A., who has succumbed to wounds, was manager of the electric power station at Tres Arroyos, Argentina, and returned home in 1915 to take up a commission.

Lieut.-Col. MACRORY, D.S.O., wounded, is a brother of Mr. R. V. Macrory, city electrical engineer, Londonderry.

Lieutenant DOUGLAS KENNETH BEST, son of Mr. Walter Best, of the electric light department, India-Rubber, Gutta-Percha & Telegraph Co., Silvertown, was killed in action on August 16th. He joined the London Rifle Brigade in 1913, and went with the 1st Battalion to France in October, 1914. He was given a commission in the 6th Essex in 1915, and went through the Dardanelles; afterwards he went to Egypt, where he saw some further active service. He was then attached to the Royal Flying Corps, and sent home to complete his training. He obtained his wings this year, and was sent to France a short time ago. He was employed for some time in the test room of the electric light department at Silvertown, and afterwards with Messrs. Wallace Bros., Ltd., of Crosby Square, and was within one month of his 21st birthday.

Private A. E. WERRELL, of the Royal Fusiliers, who was wounded in France on August 2nd, was outside representative of the A.E.G. Electric Co. up to the outbreak of war.

Gunner MAURICE LIGHTOLLER JONES, South African Heavy Artillery, who died on April 22nd, 1917, was for 10 years accountant to the British General Electric Co., Ltd., Cape Town.

Company-Sergeant-Major R. EDWARDS and Sergeant S. DAVY, York and Lancaster Regiment, who were before the war on the Rotherham Corporation tramway staff, have been promoted to the respective ranks of Regimental-Sergeant-Major and Company-Sergeant-Major.

Private J. COOPER, Royal Dublin Fusiliers, who enlisted whilst with Messrs. Siemens, of Stafford, has fallen in action.

Private J. A. MITCHELL, Seaforth Highlanders, who has fallen in action, was a driver on the Corporation tramways at Croydon.

Sergeant BERNARD CHAPMAN, Northants Regiment, who has died of wounds, was engaged with the Premier Accumulator Co.

Private A. PHILLIPS, Royal West Surrey Regiment, who joined up whilst a motorman with the Swansea Tramways Co., is reported missing since May 12th last.

Lance-Corporal E. RICHARDSON, East Kent Regiment, who was prior to the war engaged at the Maidstone Corporation electricity works, is reported dead after being missing since October 7th, 1916.

Lance-Corporal C. BISHOP, Sussex Regiment, killed in action, was formerly with the Brush Electrical Engineering Co., Ltd.

Sergeant A. B. CLIFFORD, Royal Engineers, formerly in the electrical department at Wharfedale Silkstone Colliery, has been awarded the Meritorious Service Medal for special work at the front in connection with mining.

Private W. CLARE, West Yorks Regiment, who was on the Halifax Corporation tramway staff, has fallen in action.

Sergeant J. BERRYMAN, Royal Fusiliers, son of Inspector Berryman, of the Torquay Tramway Co.'s staff, and who enlisted whilst a motorman on the system, has been promoted to the rank of Company-Sergeant-Major.

The Military Cross has been awarded to Sec.-Lieut. EDWARD HARLEY, York and Lancaster Regiment, formerly assistant electrical engineer to Hastings Corporation.

Formerly employed on the Blackpool and Fleetwood tramways, Private J. SIMPSON, A.O.C., has died from heat-stroke in Mesopotamia. He was 38 years of age.

Signaller-Sergeant F. HILL, in hospital in France, suffering from shrapnel wounds, was employed in the Lytham & St. Annes tramway offices.

Private R. A. STEWART, of Wallasey, who has been killed in action, was an electrical engineer in Liverpool.

Private FRANK SMITH, who has been killed in action, was on the tramway staff of the Doncaster Corporation.

Corporal W. HOLT, Machine Gun Corps, of Crawshawbooth, has been awarded the Military Medal, and also recommended for the Distinguished Conduct Medal. Prior to enlisting he was employed in the British Westinghouse Co.'s works.

Private J. CODDICK, King's (Liverpool) Regiment, has died from wounds received in action; he was employed by the Automatic Telephone Manufacturing Co., Ltd.

Private N. TAYLOR, West Riding Regiment, who is reported missing, was employed by the Halifax Corporation tramway department.

Private H. BROOKE, of the Grenadier Guards, who has been killed in action, was a driver on the Bradford Corporation tramways prior to the war.

Company-Sergeant-Major HUGH HOUSTON, York and Lancaster Regiment, formerly with the Glasgow Corporation tramways, has been awarded the Military Medal for conspicuous gallantry.

Lance-Corporal J. LESLIE, King's Own Scottish Borderers, a former employé of the Glasgow Corporation tramways, has been posted as missing.

Private H. BURNS, Manchester Regiment, previously reported missing, and now officially posted killed, was employed by Messrs. W. T. Glover & Co., Ltd., cable makers, Trafford Park.

Private B. REILLY, Lancashire Fusiliers, killed in action, was formerly employed by Messrs. Charles Macintosh & Co., Ltd., cable makers, Manchester.

Obituary.—THEODORE TURRETTINI.—In *La Revue Générale de l'Electricité* the death of M. Théodore Turrettini is recorded; he was a Swiss engineer of the first rank, and took part in 1868 in the first test of Siemens & Halske's electric generators at Berlin. He was one of the experts advising on the utilisation of Niagara Falls in 1891, for 20 years a member of the Administrative Council of Geneva, and for long periods a member of the municipal and national councils, a colonel of artillery, and consulting engineer to many important undertakings.

Will.—An estate of the gross value of £405,965, with net personality £390,056, has been left by Alderman ISIDOR FRANKENBURG, J.P., of I. Frankenburg & Sons, Ltd., Manchester and Salford.

NEW COMPANIES REGISTERED.

Grimsby Electric Vehicle Co., Ltd. (148,210).—Private company. Registered August 14th. Capital, £5,000 in 1,800 7 per cent. cumulative pref. and 3,200 ord. shares of £1 each. To take over four electric vehicles and the business of an automobile proprietor and carrier carried on by J. Morris, at 67, Wellowgate, Grimsby, also to carry on the business of bakers, wholesale and retail confectioners, &c. The subscribers (each with one share) are: J. Morris, 67, Wellowgate, Grimsby, wholesale confectioner and vehicle owner; Mrs. E. R. Morris, 67, Wellowgate, Grimsby. The first directors are: J. Morris (managing director) and Mrs. E. R. Morris. Registered office: 67, Wellowgate, Grimsby.

A. Chase & Co., Ltd. (148,214).—Private company. Registered August 14th. Capital, £3,000 in £1 shares. Electrical and general engineers, &c. Agreement with A. M. Cole and A. R. Cole. The subscribers (each with one share) are: A. M. Cole, 97, High Street, Teddington, engineer; A. R. Cole, 97, High Street, Teddington, engineer; T. B. Hill, Hillside, Tonning, accountant. The first directors are: A. M. Cole, A. R. Cole, and T. B. Hill. Registered office: 97, High Street, Teddington.

Portable Electric Motors, Ltd. (148,223).—Private company. Registered August 14th. Capital, £2,500 in £1 shares. To acquire certain inventions and rights relating to portable electric cutters, &c. Agreement with G. Fryer. The subscribers (each with one share) are: Lord Clifford of Chudleigh, 18, Haven Green, Ealing, landowner; G. Fryer, 121, Victoria Street, S.W.1, engineer. The first directors are: Lord Clifford of Chudleigh and G. Fryer. Registered office: 121, Victoria Street, S.W.1.

Argilla Aluminium Co., Ltd. (148,228).—Private company. Registered August 15th. Capital, £7,500 in 5s. shares. Manufacturers of aluminium and other metals, &c. Agreement with R. D. Mackintosh, M.B. The subscribers (each with one share) are: R. D. Mackintosh, The Bungalow, Mortlake, medical practitioner; P. Evans, 92, Victoria Street, S.W., organiser. Permanent directors: R. D. Mackintosh and P. Evans. Registered office: 92, Victoria Street, S.W.

Chemical Engineering and Wilton's Patent Furnace Co., Ltd. (148,912).—Private company. Registered August 15th. Capital, £20,000 in £1 shares. To take over the business formerly carried on at Hendon by F. Wilton and G. Wilton as the Chemical Engineering Co. and Wilton's Patent Furnace Co., also to carry on the business of electrical engineers, &c. Agreement with N. Wilton and T. O. Wilton. The subscribers (each with one share) are: N. Wilton, 100, Station Road, Hendon, N.W.4, engineer; T. O. Wilton, 6, Emerson Road, Ilford, E., engineer. The first directors are: N. Wilton and T. O. Wilton, each of whom may retain office while holding 9,000 ord. shares. Registered office: Hendon, N.W.4.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

David Anderson & Co., Ltd.—Charge on general assets (subject to debentures authorised in 1915), dated July 19th, 1917, to secure £1,000 in favour of Mrs. A. M. Anderson, Putney.

Stuart Turner, Ltd.—Mortgage on freehold premises at Henley, dated July 31st, 1917, to secure £1,250. Holders: L. H. Hanbury, A. T. Hawes, and W. Simonds.

William Taylor Electric Lamp Co., Ltd.—Particulars of £400 debentures created January 29th, 1917, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

Ackroyd & Best, Ltd.—Issue on July 31st, 1917, of £1,300 debentures, part of a series of which particulars have already been filed.

Thomas Pritchard, Ltd.—Trust deed dated July 19th, 1917, securing £6,000 debentures. Property charged: South Staffordshire Tube Works, the business of tube manufacturers carried on there, the company's plant and stock-in-trade, &c. Trustees: A. E. Pritchard, Wednesbury, and Rev. L. A. Pritchard, Sutton Coldfield.

Glantawe Electric Supply Co., Ltd. (112,615).—Capital, £15,000 in £10 shares. Return dated June 20th, 1917. All shares taken up; £15,000 paid. Mortgages and charges: Nil.

Brush Electrical Engineering Co., Ltd. (29,533).—Capital, £253,780 in ordinary stock. Return dated May 21st, 1917. £105,244 issued; £49,312 10s. paid; £55,931 4s. considered as paid. Mortgages and charges: £358,447 4s.

Anglo-Portuguese Telephone Co., Ltd. (24,545).—Capital, £200,000 in £1 shares. Return dated June 26th, 1917. All shares taken up. £51,046 paid; £98,954 considered as paid. Mortgages and charges: £33,940.

Altrincham Electric Supply, Ltd. (40,795).—Capital, £50,000 in 49,650 pref. shares of £1 each and 7,000 shares of 1s. each. Return dated June 4th, 1917. 45,000 pref. and 7,000 ord. shares taken up. £1 per share called up on 40,000 pref., 1s. per share on 5,000 pref., and 1s. per share on 7,000 def.; £40,600 paid. Mortgages and charges: £40,000.

Walter's Electrical Manufacturing Co., Ltd. (94,300).—Capital, £13,000 in £1 shares. Return dated July 18th, 1917. 11,250 shares taken up. £1,250 paid; £10,000 considered as paid. Mortgages and charges: Nil.

CITY NOTES.

Tyneside Tramways Co. The report of the directors of the Tyneside Tramways & Tramroads Co. states that the surplus of receipts over expenses was £7,490, which, with the balance brought forward from last half-year of £664, makes a total to the credit of profit and loss account of £8,154, and after deducting interest on debentures, loans, &c., amounting to £1,012, there remains an available balance of £7,142. This profit the directors propose to appropriate as follows: In the payment of a dividend on the preference shares at the rate of 5 per cent. per annum (less income-tax), £601; in the payment of a dividend on the ordinary shares at the rate of 4 per cent. per annum (less income-tax), £2,678; in placing to the credit of reserve for renewals, depreciation, and other contingencies, £1,000 (this, with £576 interest on investments, will increase the fund to £27,413); in placing to the credit of special reserve account, to meet contingencies, £1,000; in setting aside for the reduction of registration and formation expenses, &c., £389; leaving to be carried forward to next half-year £1,474. The traffic receipts show an increase of £5,539, compared with the corresponding period of last year.

Electro Bleach & By-Products, Ltd.—Interim dividend of 3½ per cent. (less income-tax) on the preference shares, payable on September 1st next.

France.—The capital of the Société Française des Fonderies et Acieries Electriques, of Paris, is being increased from £40,000 to £100,000.

A new company has been formed in Lyons, with a capital of £20,000, and the title of La Société pour la Création et l'Utilisation des Forces Motrices, to establish hydro-electric plants.

Crossley Bros., Ltd.—Interim dividends of 5 per cent. per annum on both the preference and the ordinary shares for the half-year ended June—the same as last year.

Guildford Electricity Supply Co., Ltd.—The report of the directors, to be presented at the meeting on Monday next, states that the gross receipts for the past year were £12,792, as compared with £12,098 for the year 1915, thus showing an increased revenue of £694. There is a balance on the revenue account of £2,657 (after crediting depreciation fund account with £572), as compared with a balance of £1,380 on the revenue account for 1915, when no provision was made for depreciation. After making due provision for debenture interest, interest on temporary loans, and the placing of £514 to the credit of reserve fund account, the net revenue account shows a balance of £289, and the directors recommend that this balance be carried forward to the credit of the net revenue account for the present year. The company during the past year has again suffered owing to the increased cost of production of electricity, and also to some extent by the decrease in the sale of current for lighting purposes. To meet these difficulties the directors were compelled again to increase the company's charges for current for all purposes as from the end of June quarter, 1916.

Reduction of Capital.—*Creed & Co., Ltd., and Reduced.*—The order confirming the reduction of the capital of this company from £130,000 to £90,000 was registered by the Registrar of Joint Stock Companies on August 9th.

Stewarts & Lloyd.—Interim dividend for the half-year ended June 30th at the rate of 10 per cent. per annum on the preferred ordinary shares, to be paid on August 31st, the same as a year ago.

Blackpool & Fleetwood Tramroad Co.—An interim dividend of 4 per cent. per annum, free of income-tax, on the ordinary shares has been declared. The same rate was paid a year ago.

Calcutta Electric Supply Corporation, Ltd.—The number of units sold to consumers during the four weeks ended June 29th, 1917, amounted to 2,230,711, compared with 1,866,546 units in the corresponding four weeks of 1916.

STOCKS AND SHARES.

TUESDAY EVENING.

VARIOUS of the electric lighting shares are quoted ex dividend, but this has not checked further advances in their prices. That is to say, the amount of the deduction has been more than recovered; and the prices of the shares are decidedly good. Rises have occurred in Charing Cross ordinary and preference, County, St. James's, City of London, Metropolitan, and Westminster. The market is good all round, and has received a little attention in consequence of an article in one of the evening papers suggesting that investors will find in this section excellent opportunities for cheap purchases.

The advice would be very sound, were it not for the fact that there are scarcely any shares to be had; and the little demand which arose as a result of the article found no amount of stock worth mentioning ready to supply it. This, of course, has been pointed out in these notes from time to time. The best way of securing shares is to leave an order with a stockbroker that he shall pick them up at a fixed price whenever any happen to come to market; otherwise, the would-be purchaser is likely to be disappointed, and, after waiting some time, will probably elect to put his money into something else.

The threatening aspect of affairs in the railway world caused a natural dullness amongst the various issues of the steam companies, and most prices are lower on the week, despite the calmer complexion that the trouble assumed on Tuesday. The depression coloured to some extent the stocks of the electrically-driven concerns. Districts, for instance, are down to 15. Metropolitan keep steady at 22½. The income bonds of the Underground Electric Railways are maintained by the consideration that the price carries £2 net dividend in it at the present time, and, accordingly, it shows another rise of ½ at 82½.

From the speculative point of view, the most interesting features in the Stock Exchange at the moment are those connected with Mexico. Carranza is declared, by those who profess to know what they are talking about, to entertain a new-born friendliness for the railway systems and the utility companies. Whether this be so or not, the prices of all the stocks have advanced hand over fist, and come, of course, upon the top of substantial improvements a week ago.

Mexican Tramway 5 per cent. bonds at 11½ are 1 point up, following their previous rise of ½. Mexican Light & Power preferred at 29½ is also 1 point to the good, after its rise of ½ last week. Pachuca Fives at 35½ are up 7, and Monterey Fives at 23½ have also gained several points. The same tendency is noticeable in everything else pertaining to Mexico, but, as those who follow the course of these markets are

fully aware, it requires very little demand to push up prices; and a rise of a few points can easily be secured in some particular security without any stock at all changing hands.

Foreign descriptions are very firm throughout, although British Columbia deferred has lost part of its rise of last week, and at 29 is 1 to the bad. A little buying of Anglo-Argentine Tramway issues is reported. Brazilian Traction remain at 49. Bombay Electric preference at 9½ are ex dividend.

Cable stocks and shares show no diminution of strength. Indo-Europeans have risen £1. Eastern Extensions are ½ higher. Westerns are up ¼. The Telephone list is equally good. Chiles and United River Plates are both 1/16 higher. The rise in Marconis is well maintained; the shares now are quoted 3 1/16, ex the dividend of 2s. There is a fair amount of business doing in this department, but there would be more were there a sufficiency of shares to satisfy the would-be buyers.

British Aluminium ordinary are 1/32 better at 31s. 3d. British Insulated put on 7s. 6d. to 13½, and Castner-Kellners are good at 3 7/16. Nearly all the sections given up to industrials exhibit prominent strength. For August, there is quite a lot of business doing.

This applies also to rubber shares, where a large volume of business has been accompanied by very little alteration in quotations, arguing that the buying is fairly well balanced by the selling. The iron and steel market would be better were it not for the labour difficulties, which it is feared may radiate from those engendered by the minority Union of the railwaymen. The armament group is quiet; and amongst base-metal shares, notwithstanding the prices now current for the metals themselves, there is but little doing.

SECOND REPORT OF THE COMMITTEE FOR THE INTERCONNECTION OF THE LANCASHIRE AND CHESHIRE ELECTRICITY SUPPLY SYSTEMS.

(Continued from page 153.)

Basis for Determining the Charges for Electricity Supplies.

—15. The Committee consider it of importance that some basis for arriving at the costs for the different classes of supply should be put forward in this report.

They fully recognise the complexity of this problem, and consider it impossible to formulate any uniform rate or rates.

16. **BULK SUPPLIES.**—By a bulk supply is implied a supply afforded by one undertaking to another under an agreement for a defined period, and which is available at all times from the undertaking giving the said supply, and the undertaking receiving the same agrees to use regularly for supplying the usual requirements of consumers in his district.

The Committee recommend that—as a general rule—only those stations now employing or about to employ individual generating sets of not less than 5,000 kw. capacity should in the future be used for bulk supply purposes.

The items which should be included in the cost per unit at the bus-bars of the supply station are:—(a) Capital charges on generating plant, (b) working expenses of generating plant, (c) coal.

(a) **CAPITAL CHARGES ON GENERATING PLANT.**—The pre-war cost of installing a complete plant using modern sets of not less than 5,000 kw. will not be found to vary greatly as between one locality and another. The Committee propose that the figure should be taken out in each case and the total annual charges thereon, calculated at 10 per cent., should be expressed in £ per kilowatt of maximum demand (kw.d.).

(b) **WORKING EXPENSES (GENERATION ONLY).**—Under this heading are included:—

Coal (Stand-by)	Expressed in £
Oil, Waste, Water, and Stores	per kilowatt
Wages and Salaries	of maximum
Repairs and Maintenance	demand per
Management	annum.

Although not strictly accurate, the method of treating the above working expenses as an annual charge per kw.d. greatly simplifies the calculation, and is sufficiently near theoretical accuracy for all practical purposes.

No allowance has been made in any of the above estimates for rates and taxes, as the Committee are of opinion that all plant at power stations used for electrical supplies delivered outside the area in which the power station giving the supplies is situated should be exempted from local taxation.

(c) **COAL (RUNNING).**—The Committee recommend that the item of total fuel costs should be based on a consumption of 28,000 B.T.H.U. per unit delivered to feeders at stations, with a 30 per cent. load factor, provision being made for a variation in the price of fuel. The allocation of the total fuel costs between "running" and "fixed" expenses being determined according to load factor.

A numerical example is given in a schedule, from which it is seen that for a 30 per cent. load factor the costs delivered to feeders at the station bus-bars equal £2 6s. per kw.d. per annum, plus .168d. per unit.

A table is also included in the schedule showing a suggested variation in the price per unit for load factors above and below 30 per cent.

Alternatively, this variation may take the form of a reduction in the running charge of .168d. per unit of from 1 per cent. to 7½ per cent. for load factors between 30 per cent. and over 50 per cent., and an increase in the said running charge of .168d. per unit of from 1 per cent. to 200 per cent. for load factors between 30 per cent. and 10 per cent.

The undertaking receiving the bulk supply shall declare its maximum demand in kilowatts, which may be exceeded to the extent of 15 per cent. only.

In arriving at the fixed charges to be paid per annum to the supplying authority, the actual recorded kw.d. at the station supplying shall in every case be taken. There shall be a minimum fixed charge per annum payable in respect of all bulk supplies by the purchasing authorities, which minimum shall be based on 85 per cent. of the said declared maximum demand.

All bulk supply agreements shall be entered into for a minimum period of 12 months.

The bulk supply rates ascertainable in the manner put forward by the Committee shall only be applicable to authorities purchasing supplies involving a kw.d. of not less than 500.

17. **STAND-BY SUPPLIES.**—By a stand-by supply is implied a supply given under an agreement for a definite period which one undertaking is under a distinct obligation to give to any other undertaking—if called upon to do so—at any hour of the day.

Stand-by supplies are capable of being divided into two classes:—

A.—Those in which energy is actually supplied by one undertaking to another at certain periods (including peak-

load hours) for varying reasons, e.g., breakdowns of plant, new plant under construction not completed by contract date, &c.

B.—Those in which no energy may pass although the supply authority is standing by the whole time. This class of stand-by supply may be termed an insurance against accidents.

The rates for Class A supplies shall be determined on the actual kw.d. recorded at the supply station, and, as far as possible, shall be based on the rates put forward for bulk supplies, with due regard to all local circumstances or special conditions.

The prices for Class B supplies at the bus-bars of the supplying station shall be determined at the rate per annum per kilowatt of maximum demand of the guaranteed stand-by corresponding to 33½ per cent. of "the capital charges" per annum set forth under "bulk supplies."

For all energy that may pass under the Class B supplies the rate per unit shall be in accordance with the overall costs according to load factor set forth in the table for bulk supply.

18. **EMERGENCY SUPPLIES.**—The Committee consider that it is difficult, if not impossible, to formulate charges for a supply of this character. Under certain conditions the rates set out under either bulk supplies, stand-by supplies, or reciprocal supplies might be applicable, depending to a large extent on the capability of adjacent undertakings to afford such supply at the time it is required. Moreover, in an extreme emergency, and in order to avoid a partial shut-down, it may be necessary for certain undertakings to incur heavy additional costs through having to temporarily use small or obsolete plant. In all cases, therefore, the charges under this heading would be determined by the district boards after investigating the circumstances.

19. **RECIPROCAL SUPPLIES.**—These supplies may be given during periods of light load, or heavy load, or both.

A.—**Light Load Periods.**—Light load periods may be taken to mean 6 p.m. to 6 a.m. daily, and 12 noon Saturday to 6 a.m. Monday; holiday times, and such other hours, if any, between 6 a.m. and 6 p.m., as may be mutually agreed between undertakings.

The Committee propose that the rates for this class of supply, at the bus-bars of the supplying station, shall be determined as follows:—

(a) 33½ per cent. of the capital charges per kw.d. per annum.
(b) 25 per cent. of the working expenses per kw.d. per annum.

(c) A running charge per unit to cover the cost of fuel.

A numerical example of the application of the above proposed basis for this class of supply is given in a schedule, assuming a load factor of 30 per cent.

In every case the kw.d. shall be the actual maximum demand at the supply station bus-bars.

One week shall be taken as the minimum period in arriving at the kw.d. charge.

B.—**Heavy Load Periods.**—These are defined as being all other periods than those specified for the light load periods.

The rates applicable to this class of supply are the same as for bulk supplies.

Basis for Allocating the Capital Charges on Interconnecting Mains, Transformers, and Switchgear against the Revenue Accounts of the Participating Authorities.—20. As previously provided, each participating authority shall—where necessary—apply to the proper Government authority for borrowing powers for the interconnecting mains to be laid within its own statutory area. Each authority shall in like manner apply for the borrowing powers in respect of transforming plant and switchgear required for interconnecting purposes. If interconnecting mains have to be constructed in any area intervening between the statutory areas of two participating authorities, each of the participating authorities shall apply for borrowing powers for one-half of the cost of such mains.

21. The capital and maintenance costs for interconnecting mains and plant shall be allocated by the board against the respective participating authorities on the basis that each authority shall pay the proportion of such costs corresponding to his user of the said mains and plant. In making the allocation the board will give due regard to the potential and actual demand of each authority, the amount of energy transmitted, and the purpose for which such energy is required, i.e., for bulk, stand-by, or reciprocal supplies.

22. When new or existing mains and plant are used partly for interconnecting and partly for supplies to industrial or other consumers, the board shall allocate a proportion of the total capital and maintenance costs incurred in affording such supplies, and shall charge this proportion against the authority or authorities supplying such industrial or other consumers, the balance of the costs to be allocated as set out in Clause 21.

23. The maintenance of all interconnecting mains and plant shall (unless otherwise directed by the board) be carried out by the authority in whose area such mains and plant are situated. In the event of a portion of the interconnecting main being situated in any area intervening between the statutory areas of two participating authorities, the maintenance of such portion shall be carried out (unless otherwise directed by the board) by the authorities at whose cost the mains have been provided.

24. The rates of charge set forth previously for bulk sup-

plies, stand-by supplies, and reciprocal supplies are given in terms of units delivered to feeders from the bus-bars of the supplying generating stations. As supplies given by interconnecting mains between various authorities may sometimes be metered at the boundaries of the respective areas of supply, and sometimes at the bus-bars of the receiving station, it is proposed to add a percentage to the overall costs (per kW. demanded) and per unit supplied as previously laid down to cover transmission and transformation losses. These losses are estimated to fall within the following limits:—

Transmission losses 1 per cent. to 2 per cent. per mile.

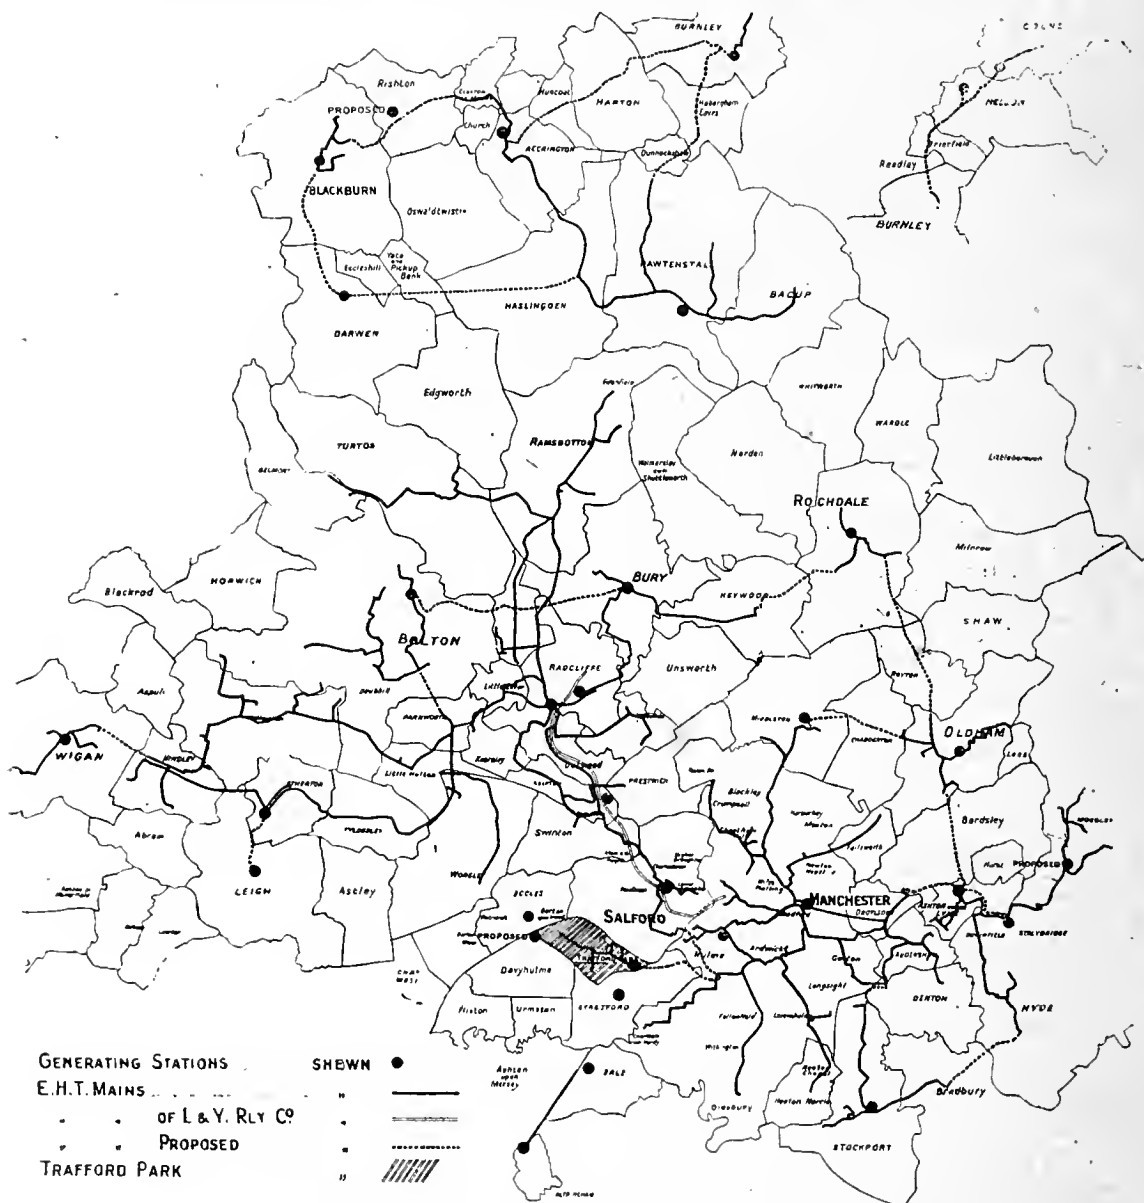

Transformation losses ... 2½ per cent. to 5 per cent.

25. As the interconnecting mains between the various undertakings will in most cases pass through the areas of several rating authorities, and would therefore become liable under existing methods of rating to repeated taxation, and as the mains are to be used for mutual and national benefit,

statutory authorities owning the interconnecting mains should—subject to the terms of Section 6 of the 1909 Electric Lighting Act—be allowed to furnish a supply to the said premises.

27. The Committee, in setting forth above the basis of charges for supplies, have not made provision for any "direct" profit on sales thereon for the purpose of rate-aid, which must therefore—in the absence of any legislation—be left to be decided by each undertaking as at present, in accordance with the accepted local policy.

The Committee cannot refrain, however, from giving expression to the opinion that the practice of making profits for the purpose of handing over substantial grants in aid of local rates is detrimental to the interests of an adequate and economical supply of electricity, particularly for industrial purposes. On the other hand, they would lay stress on the necessity of making adequate provision for depreciation and obsolescence of plant.

LANCASHIRE AND CHESHIRE SCHEME: MAP OF AREA DEALT WITH IN THE REPORT.

the Committee is of opinion that all interconnecting mains and plant should be entirely exempted from assessment for rating purposes unless used for distributing supplies to consumers. The Committee would point out that the methods of assessing electrical mains and plant differ in the various localities, and unless special protective provisions are introduced with regard to rating interconnecting mains, rates will be charged on supplies in one district for which corresponding rates have already been paid in other districts. It would be obviously unfair to rate mains used for exchanging supplies between stations on the same basis as mains used for distributing supplies within the areas of the participating authorities.

Miscellaneous Provisions.—26. The Committee have considered the possibility of interconnecting mains being laid in the area of a statutory authority who is unable or unwilling to afford a supply of electrical energy to the premises in his area of industrial or other consumers requiring a supply.

They therefore recommend that one or both of the adjacent

28. Whilst the Committee are of opinion that, broadly speaking, no direct profits should be made on the supplies enumerated in this report, a possible exception may arise in the case of electricity supplies which are given to new industries established in an area other than that of the authority containing the source of the supply.

In this instance the establishment of the new works brings increased rateable value to the district in which they are established, and if, as may very well prove to be the case, the inducement to establish such new industries in the selected area was a supply of cheap electricity (purchased from another authority) it appears only reasonable for the supplying authority to expect some direct return on the sale of current.

Summary of Recommendations on Interconnection.—29. As a preliminary step it is essential that a scheme of interconnecting the power stations of certain of the existing electrical undertakings in Lancashire and Cheshire should be at once proceeded with.

30. That the proper authority to control this movement

would be a local joint board, on which local authority and company interests are represented in the manner set forth in the foregoing report.

31. That the existing rights of all electrical undertakings as distributors should be observed within their statutory areas.

32. Any undertaking adversely affected financially by reason of the co-ordination of the interconnected power stations should be reimbursed by the participating authorities.

33. That the basis for costs of supply between authorities and all charges in relation to expenditure on interconnecting mains and plant should be determined by the joint board in the manner described in the report.

The Conferment of Additional Powers upon the Joint Board in regard to the Establishment and Control of all Future and Existing Power Stations and High-Pressure Transmission Lines.—34. The Committee recognise that the matters dealt with under this section of the report are somewhat outside the strict terms of their reference, but the future economical development of electricity generation and supply on a large scale is so bound up with the question of interconnection of existing undertakings that this report would not be complete without a reference to the larger question.

35. The Committee would again reaffirm their opinion that it is not desirable or necessary to interfere with the existing rights of undertakings with regard to the distribution of electricity within their statutory areas.

36. During the course of its deliberations on "interconnection" the Committee had under consideration the necessity in the near future of making provision for a much larger output than is at present called for, thus necessitating the erection of new power stations or additions to existing stations which would be used (in conjunction with the new and existing systems of high-pressure interconnecting mains) to furnish supplies to areas now served by a number of existing undertakings.

37. The units generated by the undertakings included within Groups A, B, C, and D amounted to 421,000,000 units for the year ending March 31st, 1916. Under normal conditions the rate of increase is about 20 per cent. per annum, so that during the next five years the output may be expected to increase to at least 1,000,000,000 units, and the maximum load, which for the year ended March 31st, 1916, amounted to 138,429 kw., will have correspondingly increased to 300,000 kw. The average increase in load is, therefore, equal to 32,000 kw. per annum for the whole of the groups.

38. The Committee have carefully considered how this increase in production can be met so as to achieve the most economical results, both in the employment of capital and in reduced operating expenses.

39. In some districts it may be desirable to increase the capacity of existing stations, while in others it will be necessary to erect new power stations. In both cases the new plant will consist of large units which will be used in conjunction with the new and existing systems of high-pressure interconnecting mains to furnish the total supply to certain statutory areas and to augment the existing supply to others.

40. In the preceding report dealing with interconnection the Committee, in order to ensure the most economical results, recommend, *inter alia*, that powers should be conferred on the joint board to co-ordinate and prescribe the running hours of existing stations and to act in an advisory capacity in regard to all proposals for future extensions of generating plant. The joint board, as one central body, will therefore exercise some of the powers at present administered by each existing statutory authority.

41. The Committee have considered whether the new power stations required to supply more than one authority should be erected and operated by a combination of the authorities more immediately interested in the use of such power stations as contemplated in Section 8 of the Electric Lighting Act, 1909 (subject to the powers of the joint board as previously set out), or whether the erection and operation of such new power stations should be provided at the cost of, and be operated by, the joint board, thus necessitating the conferment of financial and administrative powers upon the joint board.

42. In the ordinary course of development, as indicated in Clause 37, a considerable improvement would no doubt result over present methods if, in certain localities, new power stations were erected at the cost of those authorities who, for the present or immediate future, will obtain their supplies from such a source, but as such power stations increase in size, and the area over which their supply is given also increases, a larger number of authorities become interested in the operation of the stations, and will naturally require representation in their administration.

43. As the new stations will be interconnected with each other, it appears inevitable that there must be a general co-ordination of effort, first in localities, then in districts, and finally in the larger area covered by this report. In view of this inter-relationship between existing statutory authorities in the different localities and districts, the Committee are of opinion that ultimate developments may lead to a complete federation of the interests of the whole of the different authorities in the area.

44. Many advantages would be derived if the financial and controlling powers now exercised by the various company

and municipal undertakings in the areas under consideration were centred under one owning and operating authority. The time involved and expense at present incurred by individual undertakings and Government departments in connection with the procedure for raising and repaying capital would be greatly reduced. The apportioning of the capital and maintenance charges on plant and mains used for interconnected supplies between the various participating authorities would be avoided. All questions of profit, direct or indirect, between one authority and another would be eliminated, and by reason of centralised and collective ownership there would be more effective control than would be possible under any scheme of individual ownership.

45. The initiation of such a scheme at the present time presents certain difficulties which cannot be overlooked. The capital expenditure per kilowatt of plant installed, the cost per unit generated, and the selling price to industrial consumers vary so considerably as between one authority and another that the owning and operating of the whole of the existing power stations by a central authority might, unless adequate safeguards are provided, adversely affect those authorities who at present have the benefit of low capital expenditure, low generating costs, or favourable local conditions, to the immediate benefit of other authorities who do not possess these advantages.

46. Under the interconnection scheme, it seems inevitable that some of the less efficient power stations must be superseded in favour of more economical supplies from the new power stations, or from new plants installed in the more favourably situated existing stations, and it appears to the Committee that in such cases the undertakings so affected must necessarily be relieved of the financial obligations resting upon them in respect of superseded plant.

47. The difficulties referred to in Clause 45 will be largely overcome as the less efficient power stations are superseded, because the capital expenditure per kilowatt and the generating costs of the remaining stations in the various localities will tend to become approximately the same. The Committee feel, therefore, that while the rights of the statutory authorities should be maintained as regards the distribution and sale of energy, it may be desirable in order to secure a closer co-ordination of effort to invest the joint board with further powers to erect new power stations, and to acquire when and where necessary the ownership and control of existing power stations. The Committee recommend that powers to acquire existing stations should only be exercised after the joint board has approved thereof by a two-thirds majority, and would be subject to the sanction of the proper central Government tribunal. Any authority whose undertaking is being acquired would have the right of appeal to the tribunal on all questions, financial and otherwise, relating to the action of the joint board.

In the case of companies, these proposals would probably involve the purchase of their entire undertakings.

48. In the event of a power station being purchased under Clause 47, the joint board shall supply energy to the authority owning such power station at a price not exceeding the cost at which energy was produced at the said power station during the preceding 12 months, but all such prices shall be subject to revision at the close of each financial year, due regard being had in each case to all the factors entering into the costs of production.

(To be concluded.)

Testing for Troubles with a Telephone Receiver.—

One of the most useful devices for locating wiring troubles is a headband receiver of from 250 to 500 ohms resistance—the same type of receiver as is used by telephone operators. This type has the advantage of allowing the free use of both hands for testing.

In testing for door bell trouble, for instance, remove the cover from the push button, touch one cord end to each terminal, and listen. If no sound is heard in the receiver it is an indication that the circuit is clear and the wiring is all right. If a frying noise is heard it indicates a loose joint or poor connection on the circuit—on the bell, probably. If the terminals are pushed together to ring the bell while the receiver cords are still connected and a sharp back kick is heard in the receiver, it indicates that the bell is either short-circuited or the tension on the clapper is too great. If there is a rattling sound, the bell has been ringing. If every operation produces but a very faint response in the receiver, it means that the battery is weak.

After a little practice the trouble man can soon find very many uses for a receiver of this kind. By this push-button test method, trouble can be readily located and remedied. A double receiver headband should never be used, but a single one, so as to have one ear free for listening to outside noises.—*T. and T. Age.*

Municipal Tramways Conference, 1917.—This year's annual meeting of the Municipal Tramways Association will be held at Blackpool on September 20th and 21st (headquarters, Savoy Hotel). Amongst the subjects for discussion are "Principles to Adopt to Ensure the Highest Net Earning Capacity," by Messrs. Holford, Barnard and Priestley; "Rules of the Footpath," by Mr. J. Dalrymple; "Differentiation in Tramway Fares," by Mr. W. Murray; and the "Development of Tramways." The annual general meeting will be held on September 21st.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

SALVADOR.—In reporting the issue of a Decree making certain modifications in the Customs Tariff of the Republic, H.M. Consul at San Salvador states that Customs duties on imported goods are now payable as follows:—5 per cent. in U.S. currency, 10 per cent. by a draft on the United States, and 85 per cent. in local currency, at the exchange of the day. Electrical goods do not appear to be affected by the Decree itself.

CHILE.—A Presidential Decree has been issued providing that, as from January 29th, import and export duties, warehouse, lighthouse and buoy dues, and consular fines shall be collected as follows:—All with the exception of export duties are to be paid in currency, with a surcharge which is to be fixed weekly according to the average price of gold. Export duties are to be paid as to 50 per cent. in notes with the corresponding surcharge, as indicated above, and 50 per cent. in drafts on London at 90 days' sight, the amount in drafts to be paid for each gold peso to be determined according to the average exchange value of drafts, which is also to be ascertained weekly. From March 1st only 30 per cent. of the export duties is to be paid in drafts, the remaining 20 per cent. (to make up the 50 per cent.) being paid in national gold coin.

By a Decree dated January 26th a new form of consular invoice has been brought into use for merchandise shipped to Chile, which requires, *inter alia*, that each class of merchandise shall be designated in the invoice itself, and should there be various kinds of any class of goods each particular kind must be stated. Invoices are to be in Spanish throughout, and if the Chilean Consul who legalises the invoice considers that the value declared in it is not the current market price of the goods, he may note at the foot what he considers to be the true value. The Decree took effect in Chilean Consulates on May 1st, and in Chilean Customs Houses on July 1st.

ITALY-BRAZIL.—The Italian Government have denounced the provisional Commercial Agreement between Italy and Brazil of July 5th, 1900, and the Agreement will accordingly cease to have effect at the end of 1917.

BRAZIL.—An official intimation has been made that the new consular invoice regulations contained in the Budget Law for 1917, and in the subsequent Decree—see the REVIEW of April 20th—have been modified in view of the objections raised.

It is now required that invoices shall be presented for consular "legalisation" before the arrival of the vessel conveying the merchandise at the port of destination in Brazil (this supersedes the requirement that the invoice must be taken out before the departure of the vessel).

A fine will be levied on the consignee in Brazil only in cases where any discrepancy that may be discovered between the declaration contained in the consular invoice and the actual contents of packages is such that a greater amount of duty is leviable on the goods than would have been levied had the consular invoice declaration been accepted by the Customs without question.

All packages must be numbered, if possible in consecutive order; in no case may the same number be used more than once in numbering packages included in one and the same consignment (the Budget Law required consecutive numbering of packages).

NORWAY.—The exportation of carbon electrodes and electrodes for industrial use, electrode scrap, and retort graphite has recently been prohibited.

SWEDEN.—As from May 26th the exportation of the undermentioned goods has been prohibited:—

Insulating compositions, also manufactures of the compositions; mercury and mercury alloys (amalgams); vulcanised fibre and other chemically prepared fibre board in plates or sheets; vulcanised fibres in tubes or rods. (*Extensions of existing prohibitions.)

NETHERLANDS.—The Board of Trade are informed by H.M. Consul-General at Rotterdam that a statistical tax at the rate of one per mille (one-tenth per cent.) *ad valorem* is now leviable on all goods imported into, or exported from, the Netherlands, in order to defray the expenses of a Bureau which has been established to compile Customs, &c., statistics.

TERRITORY KNOWN AS "GERMAN EAST AFRICA."—Regulations have been issued by the Senior Military Customs Officer at Dar-es-Salaam setting out the conditions under which goods in transit through the occupied territory in "German East Africa" may be conveyed through the ports of Bukoba and Muanza. The text of these regulations was given in the official *Board of Trade Journal* for May 24th.

Decimal Coinage.—The Decimal Association has issued a pamphlet on the subject of British Decimal Coinage, dealing with the choice of unit: the Association considers that the question is narrowed down to the choice of the sovereign or the dollar, the former involving no change in the values of our gold and silver coinage, but a change of 1 per cent. in value of the bronze coinage, while the latter would retain the bronze coins at their existing values, but would change all the rest, including the pound sterling. The Association is clearly in favour of the retention of the pound, divided into 1,000 mils, but invites the expression of opinions from all who are interested in the subject. The view which we have always advocated, and to which we adhere, is that the pound should be retained unchanged in value.

RAILWAY ELECTRIFICATION RESULTS.

It is fortunate for us that the American railway authorities have a habit of scattering their electric railway statistics broadcast, for were the British "railway public"—amongst whom we include existing shareholders and that large section of the public which may be regarded as potential investors in railway undertakings—to depend for its information as to working results on the tender mercies of the British railways which have adopted electric traction, we fear that it would fare rather badly. The fact that British railways have in recent years equipped many miles of electrically worked routes is, of course, a general indication that a change was necessary and that electrical working has been found to offer the most satisfactory method of effecting the change. So much is clear to those who think the matter over; but how many do this?

Some valuable data was recently given at a meeting of the New York Railroad Club in regard to the electrical operation of the Chicago, Milwaukee & St. Paul and the Norfolk and Western Railroad's electrified routes. The former is the most extensive project of the kind yet carried out, being the conversion of 440 miles of main line, crossing three mountain ranges, and involving a naturally difficult route with many tunnels. This company, as stated in our issue of March 2nd last, is preparing to electrify another 220-mile stretch of main line, to Seattle, crossing the Cascade Mountains, and situated further west than the existing electrified route, from which it will for the present be separated by an intermediate steam-operated section 200 miles in length. Ultimately, however, it is proposed to electrify the whole western end of the system to the Pacific, some 900 miles in length.

The data concerns the working during the last three months of the years 1915 and 1916 under steam and electric traction respectively, of the 226-mile Rocky Mountain division, between Harlowton and Deer Lodge, which handles both passenger and freight service. Under steam conditions we find 119,330 train engine-miles plus 24,752 helper engine-miles, normally requiring 13 engines; under electrical operation 119,237 train engine-miles were run, no helper engines being required, and seven locomotives only were employed. The figures do not disclose the true position, however, as freight engines often assisted passenger trains, and it is considered that less than half the number of locomotives will suffice under electrical operation. Per engine, the train miles with steam averaged, roughly, 9,000, as against 17,000 with electricity, and the latter required 29 kw.-hours per train mile, as against 188 lb. of coal under steam conditions.

Turning to the freight service, the electrical results show to even greater advantage. Measured in 1,000 ton-mile units, 282,862 were moved under steam, and 364,087 under electric operation, requiring 176,937 steam train-miles, plus 56,363 helper engine-miles, as compared with 186,010 electric train miles and 20,157 electric helper miles. For this work 43 steam and 15 electric locomotives were used, which, allowing for the additional electric ton-miles, shows that three and three-quarter times as many steam locomotives were required to handle

the same ton-mileage, though this does no represent the whole of the difference, as more electric locomotives were available than would be normally used.

In 1,000 ton-miles per engine, steam averaged 6,745, as against 24,260 under electric traction. The total time under steam conditions was 17,825 hours, as against only 14,535 hours for electrical working, representing 3.78 mins. for steam, and 2.39 mins. for electrical working per 1,000 ton-miles, the latter requiring 39.4 kw.-hours and the former 276 lb. of coal. The steam data includes no mileage for light-engine working, while the electric working presumably allows for energy returned to the system during regenerative working, which is a feature of this line, and during one month amounted to 11½ per cent. of the total power consumed at the motors, as measured at the locomotives.

The Norfolk & Western electrification was designed for a special purpose, *i.e.*, to reduce the time taken and to obtain greater efficiency in handling the heavy eastbound mineral traffic up the Elkhorn grade and through the Elkhorn tunnel, which is single tracked. Electrical working has increased the average speed from seven to 14 miles an hour, and the average engine-miles per day from 60 to 100.

The maximum east-bound tonnage of 51,226 under steam conditions has increased to 59,543 under electrical working, but only nine electric locomotives were required to deal with the maximum day's traffic, as compared with 43 steam locomotives. In 1914, 132,618 loaded eastbound cars required 93,625 engine-hours, but in 1916, 165,680 cars were dealt with electrically in 44,112 engine-hours. The through freight and passenger trains are still worked by steam, but are helped by electric locomotives; the latter have, with reduced operating costs, doubled the capacity of the line.

Both these instances of electrical working may be classed, by those who feel so disposed, as special applications, in which the conditions were favourable to electric traction and unfavourable to steam operation, though it seems probable that the results will bear a wider application, in view of the tendency for railway conditions to become more and more difficult for steam operation, and ever more favourable to electrical working. The paying limits of railway electrification are not easily defined in practice, if battery traction is taken into consideration as an adjunct. In this country the limits of suburban electrification schemes have shown greater expansion in recent times—the South-Western being an example, while the London-Brighton, and London-Southend electrification proposals—unfortunately in abeyance at the moment—the Manchester suburban schemes, and the North-Eastern mineral railway electrification, all indicate that even our conservative railway directorates are showing a widening interest in the extended application of electric traction, under conditions which a few years ago would have been regarded in railway circles as impracticable.

An important point is that nearly all the fore-going projects originated before the war, when the cost of fuel and labour were relatively much more favourable than they are now, or will be after the war, *i.e.*, the conditions are becoming such that the paying limits of electrification will be greatly extended, and this will be even more the case when cheap electric power becomes available in large quantities in industrial areas—which are also heavy railway traffic centres—as an outcome of the proposed reorganisation of our electric supply industry. Under the probable conditions of the near future British main-line operation by electric traction may become an economic necessity—though we are well aware that the cherished tradition of the past will not be overcome without a struggle.

SOME time ago it was announced that the Government intended to appoint 12 additional Trade Commissioners. We have so often expressed our opinion concerning the usefulness of the services rendered by the four Commissioners who have acted in this capacity for some years past that we need not repeat it now. What we, as plain men, cannot understand is why, when a decision has been made it cannot be acted upon without a prolonged period of waiting. These additional Trade Commissioners have been asked for by the business world for many years past, and its recommendation has been authoritatively endorsed by committees that have reported upon the after-the-war situation. Since the Government made up its mind to act, a great deal of time and attention have been devoted to the schemes for a reorganisation of our Commercial Intelligence Services (Board of Trade and Foreign Office), and, according to the daily Press, such reorganisation scheme, bringing trade intelligence matters under unified control, has been approved by the Cabinet. It may be that it is because headway has been made at last in that connection that the Civil Service Commission has been authorised to invite applicants for the positions of Trade Commissioners to lodge particulars of their qualifications. They have to be, according to the announcement, men possessing a good knowledge of import and export trade, who have had commercial experience at home and abroad, and who should be under 50 years of age. In our own opinion, the more they know of engineering and electrical affairs the better, for we look for far-reaching and beneficial effects to ensue for our particular industries from the efforts of the 16 Trade Commissioners of the British Empire during the years following the war. The selection of the most likely men will be made by the Selection Committee of the Civil Service Commissioners, and that Committee's recommendation will be passed on to the President of the Board of Trade after the chosen applicants have been interviewed. We sincerely hope that in every case the choice will be wisely made, and on essential merit, and that there will not be another long period of waiting. The Commissioners should be ready to take up their work straightaway.

The Ignition Magneto Industry in France.

JUST as was the case in Great Britain, so also in France, prior to the war, the automobile industry was mainly dependent on the German Bosch Co. for its supply of ignition magnetos. The situation was so dealt with that quite a large number of magneto manufacturing concerns have sprung into existence there, with the object of not only freeing the business from the German monopoly, but also of rendering the country self-supplying as regards magnetos for ignition purposes. One of the principal makers is the S.E.V. Co., in which about 75 per cent. of French motor-car manufacturers are financially interested. This concern took over the Bosch establishment in Paris early in the war, and ran it until its own magneto factory, which is now ten times as large as the French Bosch plant, had got into working condition. Other French concerns now making magnetos are Messrs. Grouvelle and Arquembourg, the Salmson Aviation Motor Co., the Compagnie Générale des Magnetos, the Lavallette-Eisemann Co., the Gibaud Co., the Nilmelior Co., and about half-a-dozen other small concerns. It is understood, too, that the De Dion Bouton Co., makers of the motor-cars of that name, are establishing a plant for the production of magnetos.

BALANCER USED FOR TESTING PURPOSES.

FOR some years the balancer, of which the diagram of connections is shown, has been in use for the testing of motors and dynamos. With the use of this machine on a supply of 500 volts pressure, any direct-current motor from 50 volts to 500 volts may be tested up to a limited horse power. One of the chief features about it is that the pressure can be regulated with ease to suit any motor. This balancer is comprised of three six-pole shunt-wound machines, with lap-wound armatures, which are all direct-coupled.

The three armatures shown are connected in series with each other across the 500-volt supply. The shunt windings of all three machines are connected in parallel across 500 volts, and, as will be observed from the diagram, they have

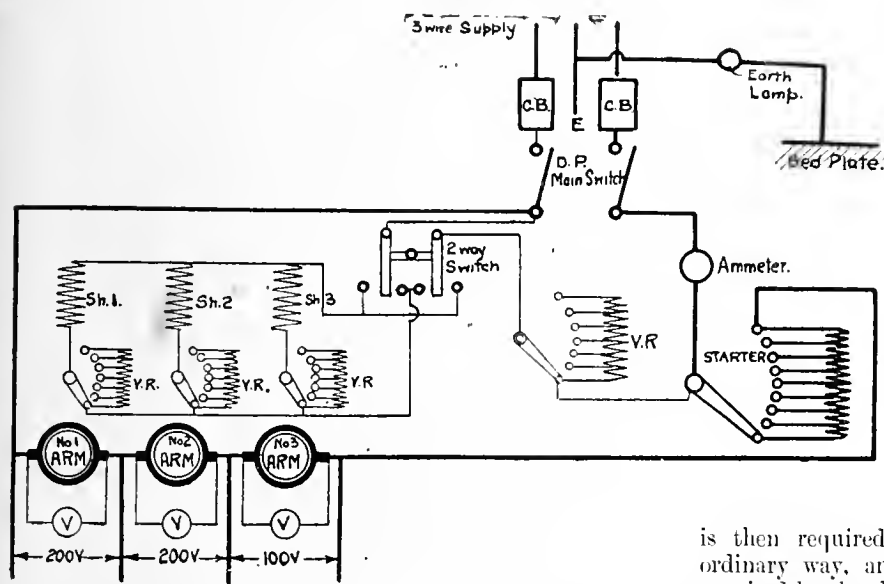

FIG. 1.

a variable resistance in circuit with each one. The pressure of 500 volts is divided up as shown in fig. 1, so that as the armatures are in series with each other, any alteration of shunt resistance alters the voltage on all three armatures: and when the volts are reduced on one armature, the volts subtracted are added to the volts on the other two armatures. If the two armatures normally at 200 volts each were reduced to 180 volts each, the armature normally at 100 volts would then be increased to 140 volts.

It is convenient to have a voltmeter connected with each armature, as shown, when the effect of using the variable shunt resistances can be seen.

The balancer itself is belted up to the larger sized machines, and so it is necessary to reverse it; the two-way switch is employed for this purpose. This switch is only operated when the double-pole switch is out, and it is possible to arrange a device to prevent breaking the shunt circuit when the current is on.

The other variable resistance shown in the diagram is for the purpose of increasing or decreasing the speed of the balancer, and so increasing or decreasing the load of any motor which may be tested by being belted to the balancer. The four cables from the armatures are connected to switchboards in parallel with each other, which are fixed in convenient positions near the test plate.

In testing the smaller sizes of machines, the load is supplied by other permanent shunt-wound machines connected as motors from the switchboard as shown in fig. 2, and when any motor is running with full load, the current generated is fed back to the balancer. This permanent shunt machine is fitted with a shunt-reversing switch for changing the direction of rotation, and also a variable

shunt resistance for adjusting the load of the motor which is being tested.

It is also convenient to have a four-way switch and voltmeter on one branch switchboard to observe the voltage between different main terminals. The outside voltage would be 500 volts, and armatures 200, 200, and 100 when normal. In an actual test of three motors, the largest being belted to the balancer, and the two others on to the permanent machines, the writer took the readings of the watts supplied and the watts used on the motors. The motor readings were:—

No. 1, 220 volts, 180 amperes	=	39,600 watts.
No. 2, 220 " 55 "	=	12,100 "
No. 3, 110 " 53 "	=	5,830 "

Total watts used 57,530

The ammeter in circuit with the balancer as shown in fig. 1 read 49 amperes when the motors were using the total watts stated, which gives us $500 \times 49 = 24,500$ watts supplied, and 33,030 watts saved. It is, of course, more economical to test as many motors as possible at one time, as the balancer takes 9,000 watts when running without load, and a load is required to justify the use of it.

When starting to test a motor, as in fig. 2, it is best to start No. 1 motor first, and in the case of testing a series motor, it is necessary to start up this motor first, as a series motor requires a load to start in order to prevent it racing away. Adjust the speed on this machine by means of the shunt resistance to give the speed required by motor No. 2. All that is then required is to start motor No. 2 up in the ordinary way, and afterwards adjust the load to what is required by the shunt resistance of motor No. 1.

It is necessary to have the shunt resistance of motor No. 1

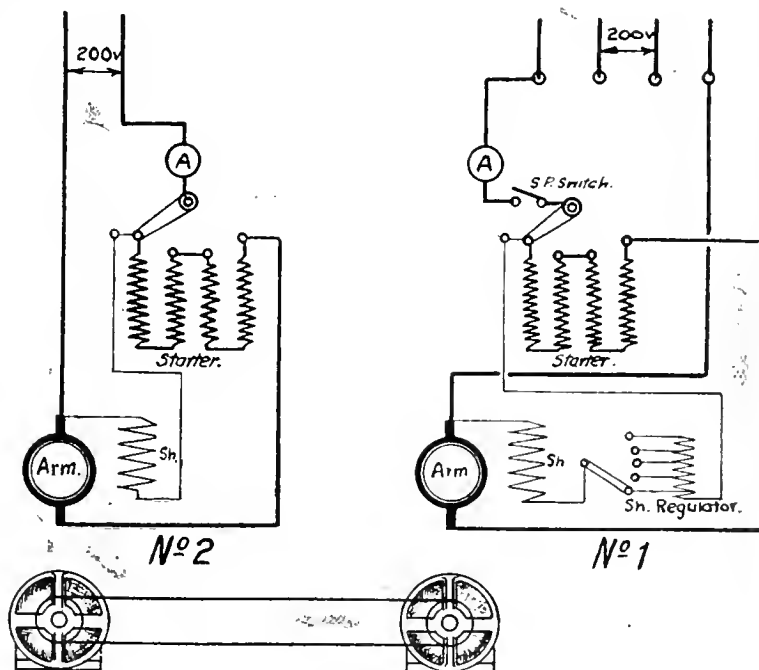

FIG. 2.

in small steps, and suitable for varying the load very slightly.—A. K.

Copper Shell Bands.—Mr. Sherard Cowper-Coles informs us that a plant of considerable size is being erected in the South of England for making shell bands by the Cowper-Coles centrifugal copper process, in which the Government is interested.

NOTES ON ALTERNATING-CURRENT TRACTION MOTORS.

NUMEROUS proposals have been put forward in connection with the development of single-phase commutator motors, suitable for the propulsion of electric trains. Prior to the war a great deal of experimental work was being undertaken, especially on the Midi Railway in France, and it is a matter of regret that this important work has been interrupted.

The single-phase system has, of course, made the greatest headway on the Continent of Europe and in America. What is used largely on the American lines is the series compensated motor: that is, a motor having the armature, the main field winding, and compensating winding connected in series. As the compensating winding carries current equal and opposite to the armature current, the cross magnetisation is neutralised over the entire pole face, and the compensating winding not only counteracts field distortion but also improves the power factor, for any field in an alternating-current machine must of necessity increase the wattless current. The main field that produces the torque and a commutating field are, of course, necessary, but the armature field is harmful, and should be compensated. Motors with a local commutating pole-winding only are satisfactory on direct-current circuits, but not on alternating-current circuits. What is wanted and what is provided in the latter case is a distributed compensating winding embracing the greater part of the armature.

The main advantage of this type of motor, having the main field and compensating windings in series with the armature, is that the machine will work with direct current. Of course, in some cases the compensating winding is short-circuited upon itself when the compensating current is produced inductively. Experiments indicate that the results obtained with the two methods of exciting the compensating windings differ inappreciably, provided the motor always works with alternating current. But when motors have to work with direct current as well as alternating current, it is better to have all the windings in series, for the compensating winding then remains active under both conditions, and will always prevent field distortion and improve commutation. Motors with the compensating winding in series with the armature are used in this country on the electrified line of the Midland Railway and on American single-phase railways.

In addition to the distributed compensating winding, there may be local commutating pole windings, but so far the use of motors built on these lines has been confined mainly to Continental railways usually working at periodicities in the neighbourhood of 15 cycles per second. The Lötschberg locomotives, for instance, are fitted with motors of this kind. The interpole winding may be energised from the secondary of a series transformer having its primary connected in series with one of the motor leads, when the strength of the current passing round the interpoles varies in proportion to the load. The axes of the main and compensating windings are at half the polar distance from one another, and the third, or commutating, winding is arranged inside the compensating winding and between two adjacent slots, so that the commutating turns only embrace a single tooth.

Certain types of so-called repulsion motors have also been used successfully on single-phase railways. The compensated repulsion motor of the Latour, Winter Eichberg type has come into considerable use for light railway work, for which it seems well adapted. The circuits of this machine are similar in most respects to those of the plain series motor, but the motor possesses an additional set of brushes short-circuited upon themselves, and in mechanical line with the windings of the stator. In distinction to the performance of the compensated series motor, in which the effect of speed is to increase the apparent resistance of the armature, which possesses negligible reactance, the armature of the compensated repulsion motor possess at starting the major portion of the apparent reactance of the motor, and the effect of increased speed is to decrease such apparent reactance continually. The motor has the advantage of working at practically unity power factor, due to the property of com-

mutator motors with short-circuited brushes having no inductance at synchronous speed and negative inductance above that speed. When employed for railway work, the speed control is obtained by a series variable-ratio transformer, the primary of which is in series with the main field circuit, and the secondary is connected to the main brushes. There need not, therefore, be any direct connection between the stator and armature, and the variable-ratio transformer permits of obtaining a number of speed-load curves. The motors operating on the electrified lines of the Brighton Railway are, as is well known, of the compensated repulsion type.

Another type of single-phase commutator motor that has proved suitable for traction purposes is the Déri motor, as fitted to the motor-coaches running on the Martigny-Orsières Railway in Switzerland. The advantage of this motor is that speed control may be obtained by shifting the brushes, with the result that all contactors and other voltage-regulating arrangements are eliminated. The stator winding is entirely independent of the armature, and current can, consequently, be supplied to these motors at pressures appreciably higher than those permissible with series compensated motors. On the commutator are two sets of brushes—one fixed and the other movable, and the fixed and movable brushes are connected together by means of flexible cables. To bring the armature to rest the movable brushes are shifted so as to be in line with the axis of the stator; but by turning this set of brushes out of this position, the armature is made to revolve. When the movable brushes shift away from the fixed brushes, the flexible cable maintains electrical connection between them, and when the brushes are brought together there is, of course, no difference of potential across the brushes. Thus no current flows in the armature. Under these circumstances, the only current taken by the motor is the magnetising current, for the conditions correspond to those which prevail when a transformer is connected to the mains without load on the secondary. But as soon as the movable brushes are shifted away from the fixed brushes, current flows in the armature winding and a torque is developed. The Déri motors employed on the Martigny-Orsières Railway are four-pole machines, and are designed for a pressure of 500 volts and a periodicity of 15 cycles per second.

The experiments made on the Midi Railway are very interesting, because every traction motor of importance has been tried. One of the conclusions arrived at was that ordinary repulsion motors are most satisfactory when running at synchronous speeds, a fact that is now pretty generally recognised. It happens that the transformer cross field in these motors is of such phase as to induce in the short-circuited armature coil by rotation a pressure which practically counteracts the harmful sparking voltage, and this cross field is of approximately the correct strength for compensating the sparking voltage when the speed attains the synchronous value. This simple fact, it seems, has settled the future of repulsion motors, for such motors are best adapted for operating near the synchronous speed. At speeds above synchronism the transverse field increases in strength, the commutation becomes unsatisfactory, and the iron losses increase.

On some single-phase motors it is customary to impress a certain voltage on the armature and main field winding, and another voltage on the compensating winding, and these motors are sometimes called series repulsion motors. The two voltages may be taken from different parts of the main transformer or from the same part of it. Imagine an armature connected in series with a main field winding and a compensating winding, and also connected to the secondary of a transformer like an ordinary series compensated motor, then if a tapping be taken from the transformer and be connected to the junction between the main field and compensating winding, we have what is sometimes called the series repulsion or doubly-fed motor. The effect of the additional transformer connection is that at the higher speeds the commutation is improved. The so-called series repulsion connection is therefore adopted as a running connection—that is, when the motor is running above its synchronous speed.

The locomotive built by the French Thomson-Houston Co. for the Midi Railway is fitted with series repulsion

motors. When starting, the brushes are short-circuited, and current is supplied to the stator terminals, so that it passes through the main field and compensating winding. After the motor has attained synchronous speed, however, the short circuit across the brushes is removed, and the armature is connected in series with the stator windings. At the same time, an additional voltage is impressed upon the compensating winding, thus producing a local strengthening of the field, which assists commutation. This voltage, like the main voltage, applied to the terminals of the motor, is taken from the main transformer. The motors on this locomotive have 20 poles: consequently, at the working periodicity of $16\frac{2}{3}$ cycles, the synchronous speed is practically 100 revolutions per minute, and this corresponds to a travelling speed of 25 km. per hour. When the armatures are connected in series with the field windings, however, the maximum speed of the locomotive is 78 km. per hour, or about three times the speed attained when the motors are running at synchronous speed.

The locomotive built for the Midi Railway by the Ateliers de Constructions Electriques du Nord et de l'Est is also fitted with motors that are started as repulsion motors, but the field windings are afterwards connected in series with the armature. At the low speed the repulsion connection gives results in every way satisfactory. There are two commutation or compensating windings, both in the same slots, and for series working they are connected in parallel. They each have a different number of turns and different cross sections, and are, of course, displaced 90 electrical degrees from the main field which provides the torque. When the motors run as repulsion motors the brushes are short-circuited and the current is fed into the machine through the main stator and compensating winding. Under these conditions, however, only one of the commutation windings is active.

The French Westinghouse Co. also built a locomotive for trial on the Midi Railway, and the motors fitted to it are ordinary series compensated motors, which transmit their power to the driving wheels through gearing, whilst the locomotive built by Brown-Boveri is fitted with Déri motors controlled by shifting the brushes. There are, of course, other kinds of single-phase commutator motors besides those which have been mentioned—such as reverse doubly "fed motors." Innumerable schemes of connections have, in fact, been devised for these machines, but it is doubtful if many of them are of any real practical value.

The motors referred to, however, have all proved themselves suitable for electric traction purposes, and some have been in service for a considerable time.

MERCURY RECTIFIERS FOR LARGE OUTPUTS.

EXCEPT in matters of detail, there has been no important change in the construction of large mercury rectifiers during the past five or six years, but there are now a number of installations which have been in satisfactory service for some years, and the popularity of large mercury rectifiers will undoubtedly continue to increase, for they offer the nearest possible approach to the ideal "static converter." Rectifiers of this type have been in use for years without requiring any renewals or repairs, and with only intermittent use of a vacuum pump. The principal features of a modern "ironclad" mercury rectifier may be gathered from fig. 1.* The main working space A and the condensing chamber B are enclosed by steel cylinders with strong steel end plates U and D. The bottom plate carries the insulated mercury cathode K, and the main anodes E pass through the ring D. Six or 12 anodes are used (for 50, 100, or 200 amperes each), and they are mounted concentrically with the cathode on as large a diameter as possible. The condensing chamber is welded to the anode ring D, and the latter makes a gas-tight but removable joint with the main chamber. The top plate of the condensing chamber carries the ignition solenoid, vacuum connection (V), and eye-bolt. The main and condensing chambers are provided with water jackets ST, which lead into annular spaces QR in the anode ring. These spaces are connected by radial cooling channels, hence the leading-in equipment is kept cool. Both the anodes and the cathode are cooled (by F and L respectively); and O P represent the fall and rise pipes for the water circulation. A compound

packing of asbestos and mercury is found most effective in preventing leakage of air through the anode bushes, &c.

A mercury trough U is mounted below the condensing chamber, and arcs emanating from the anodes are received within a funnel-shaped collector, the bottom opening of which is submerged in the mercury cathode. Reaching down to the centre of the cathode screen M is an iron striking anode H, which is operated by the solenoid J, so as to strike an arc on the mercury when commencing operation. One or two auxiliary exciting anodes G are fed with direct or alternating current, and ensure that the rectifier remains ready for immediate service, even though the load current be zero for some time (e.g., in tramway service all the cars may be stopped simultaneously).

The two values of maximum cathode current at present adopted as standard by the Gleichrichter A.G.† are 250 and 500 amperes at 110 to 800 volts. It is remarkable that one and the same rectifier can be used for any voltage within the specified limit. Also, by using 6 or 12 anodes, the same type of rectifier can be used for full output from one, two or three-phase networks. When the output of a single rectifier is insufficient to meet the needs,

several may be used in parallel and put into or out of commission like a single machine. Five 500-ampere rectifiers, for instance, yield 1,875 kw. at 750 volts.

Connections. In order to use several rectifiers in parallel, choke coils are connected in the anode branches. These may be arranged as current dividers (see fig. 2), which arrangement has the advantage of small energy consumption, but generally necessitates simultaneous working of the paralleled units. The choke coils in the circuit shown in fig. 3 have somewhat higher energy consumption and increased inductance, which is useful in damping out the current pulsations. Further, this method of parallel connection permits rectifiers to be switched on and off as desired. If each rectifier has a main transformer, the total voltage drop is sufficient to ensure satisfactory parallel working between rectifiers and/or other current-supplying equipment, without using choking coils. By connecting the transformer primary in star or delta, and using suitable choking coils, the total regulation of the rectifier may be made anything between 5 per cent. and 17 per cent., according to the characteristics of the D.C. source or sources with which it is to be paralleled. By using choking coils connected as in fig. 4, a practically constant D.C. pressure can be obtained from the rectifier at all loads from light to full, without the aid of governors or other

FIG. 1.

special gear. For instance, in a certain case, the open-circuit D.C. pressure of 500 volts fell to 140 volts (i.e., by 12 per cent.) at a current of 5 amperes or less, but thereafter remained practically constant up to a load exceeding 200 amperes.

Induction regulators or step transformers may be used for voltage regulation, and anything up to ± 5 per cent. variation in D.C. pressure may be obtained by tapings on the main transformer of the rectifier. A cheaper and more flexible system for use in charging accumulators consists of three choking coils with an adjustable core, which can be set by means of a hand wheel on the supporting spindle. The choker is connected between transformer and rectifier in the anode leads.

It is one of the advantages of the modern mercury rectifier that

* i.e., the Rectifier Co., founded at Glarus in 1913 by the Brown-Boveri Co. (Switzerland), and Hartmann & Braun (Frankfurt-on-Main). Hartmann has secured a compulsory licence to utilise the Cooper-Hewitt D.R.P. 157,642, so that there is now no difficulty in the way of constructing and marketing large mercury rectifiers. Their sale is said now to be turned over to Brown-Boveri & Co., Baden and Mannheim.

* Reproduced from a recent issue of the E.T.Z., whence these notes are derived.

it needs practically no attendance or maintenance. Neither the mercury cathode nor the iron anodes decrease appreciably in weight during several years' working, and it is generally possible to work without an air pump after a few months' operation. The only attendance then required is to start the rectifier by closing a switch or press-button in the striking-solenoid circuit. Starting occupies only a few seconds, which contrasts favourably with the time required to start a rotary converter.

Until the rectifier has settled down to steady conditions, it is necessary to check its vacuum from time to time. This may be done by the aid of a McLeod vacuum meter, or the electrical device illustrated in fig. 5 may be employed. The principle of this device is obvious from the figure, and the vacuum meter may be placed at any distance from the rectifier.

Commercial Installations.—One of the first commercial installations of large mercury rectifiers was set to work about five years

between a quarter and full load, according to the demand for air. The mercury rectifiers tested are not affected adversely by this fluctuation, and comparison of the high-tension A.C. and the D.C. meter readings shows an average efficiency of 87 per cent., including all losses.

Since the autumn of 1915, two 150-kw., 600-volt mercury rectifiers have been used in the converting sub-station of the Limmattal tramway (Zurich-Dietikon). Formerly two motor-generators had to be kept running in order to cope with the peak loads, and the mean cost of current worked out at 0.59d. per car-mile. Now, however, either of the two mercury rectifiers can deal with the peak loads of 400 to 450 amperes, hence one rectifier is in reserve, and the mean cost of current has been reduced to 0.44d. per car-mile—i.e., a saving of about 26 per cent. Successful tests were made in the way of operating the rectifiers in parallel with existing motor-generators and the overhead network of the tram-

FIG. 2.

FIG. 3.

FIG. 4.

ago in J. F. Macks iron foundry at Rodelheim (Frankfort-on-Main). The rectifier concerned delivers 80 kw. at 220 volts, and showed soon after its installation that it was possible to pass leading-in connections through a steel container, and to keep them insulated from the latter, whilst yet maintaining the necessary high vacuum (about 0.03 mm. mercury) without continuous use of a vacuum pump. This rectifier operates on single-phase supply, which is less favourable than polyphase current, and no better evidence of its satisfactory working could be desired than the fact that it is proposed to extend the equipment using similar rectifiers.

A 20-kw. mercury rectifier (110 to 165 volts), installed in the Hordt sub-station (Strassburg) in 1912, realises the good average efficiency of 85 per cent., and in this particular installation its noiseless operation is a valuable feature. More recently, a 53-kw.,

ways, the voltage drop of the motor-generators being about 14 per cent. at full load. Circumstances do not require these rectifiers to be operated regularly in parallel with the motor-generators. A certain amount of disturbance was at first occasioned in telephone circuits, but since correcting defective insulation, speech has been as clear as when the tramways were operated with pure direct current. The oscillograms in fig. 6 show the current and pressure pulsations on the D.C. side of the rectifier. The comparative smallness of the pulsations is due to three-phase supply being used and to the high inductance of the series traction motors. The latter have not run appreciably warmer since the introduction of the rectifiers. The rectifier cylinders employed are each capable of 250 amperes continuous output, but the load conditions require an average output of only 90 amperes, with momentary overloads up to 450 amperes. Each rectifier is cooled by water circulating through an elevated cooling tank of corrugated iron, and, apart from adding water from time to time, the cooling system requires no special attention. After some month's operation, the air pump can be put permanently out of service. Alternating current excitation is provided to ensure that the rectifiers keep in commission, even should the current consumption fall temporarily to zero.

In the Norstadt sub-station of the Pforzheim municipal electricity station, the primary supply at 5,120 volts, 50 cycles, is converted to 110/220 volts D.C. (three-wire system). Four rectifiers,

FIG. 5.

230-volt, rectifier has been installed in the Dettweiler sub-station, this rectifier working alone or in parallel with a dynamo, according to the current required. Tests have shown that as little as 10 amperes rectified current may be taken without impairing the stability of working.

A battery-charging rectifier of 15-kw. output at 110 volts has been in use at the Charlottenburg Technische Hochschule since 1914 with satisfactory results; and the Maschinenfabrik Lanz (Mannheim) is putting in a 300-kw. installation of the latest type of mercury rectifier. Messrs. Brown, Boveri & Co. (Baden, Switz.) have had an interesting converting station (115 kw., 220 volts) in service for two years past for testing rectifiers on long-continued load. A 165-kw. D.C. motor with commutating poles forms the load. The motor drives an air compressor, and the load fluctuates

FIG. 6.

each yielding 75 kw. at 110 volts, or 150 kw. at 220 volts, are mounted side by side on a common plinth. The equipment feeds the town lighting and power network, and the rectifiers have to work sometimes in parallel with D.C. generators and with a rotary converter. Primary induction regulators in front of the rectifier transformers permit of ± 10 per cent. voltage regulation. The air pump and induction regulator are mounted inside the plinth. Water circulation is provided to cool the rectifier container; about 10 gallons of water per hour are required per 100 amperes useful current.

In the Plauensche Grund electricity station (Denben-bei-Dresden) mercury rectifiers have been used since the beginning of 1916 to convert primary high-tension two-phase current to direct current at 530 volts for traction purposes. The two phase voltages may

differ by as much as 10 per cent. in the course of a day, and, to compensate for this, a single-phase induction regulator may be connected in the leads of one phase, whilst for overall voltage control a two-phase main regulator may be connected in front of the rectifier. One or two of the rectifiers are generally in reserve. The rectifiers work alone or in parallel with the buffer battery or traction generators. The current output varies generally between 100 and 650 amperes, and the maximum voltage drop on the rectifier bus-bars is about 10 per cent. Another rectifier installation of equal power and voltage is in service at the Döhlen Steel Foundry (Dresden). In this case the current output varies from 600 to 800 amperes at 530 volts. This equipment was set to work early in 1916, and up to last October had delivered more than 1,000,000 mmts (D.C.). The D.C. and high-tension A.C. meter readings show an average overall efficiency exceeding 90 per cent. The rectifiers work in parallel with an 850-kw. Siemens-Schuckert turbine-dynamo and a 300-kw. Brown, Boveri set, except on Sundays, when the steam plant is shut down, and the rectifiers carry the whole D.C. load.

Two large installations which are in course of erection are a 500-kw., 400-volt, rectifier equipment for the Hirschberg electricity station, and a 600-kw., 800-volt, equipment for the Berggeist station.

The capacity and security of working of the mercury rectifier may soon be raised to the level attained in A.C. transformer practice. If it is found possible to deal with pressures up to or exceeding 5,000 volts, a particularly wide and valuable field of application is opened for rectifiers in electric railway practice. At such high pressures the loss in the rectifier would be negligible in comparison with the transformer losses and those in the line. The overall efficiency of the conversion would exceed 97 per cent. Possibly the rectifiers would be installed in sub-stations along the line, or they might be carried on the locomotives themselves, as has already been done experimentally in America. As regards producing very heavy currents for electrochemical purposes—say, 100,000 amperes or more, there is no reason to anticipate any insuperable difficulty, since rectifiers and groups of rectifiers can now be operated quite successfully in parallel.—S. M. POWELL.

COMBINED COAL AND COKE-OVEN GAS FIRING.

In view of the great interest which is being taken in fuel economy at the present time, and the efforts which will undoubtedly be made in the future to utilise all available sources of waste heat, particularly in connection with electrical generating stations, where in many cases it would not be possible to depend entirely on gas firing, the following particulars of the practice followed by the Toledo Railways & Light Co., U.S.A., at its Water Street Station, described in a recent issue of the *Electrical World* by O. W. Morgan, may be instructive:—

This company decided to adopt apparatus for the simultaneous burning of coal and coke-oven gas with a view to increasing boiler output to meet the growing load.

ARCH AND BAFFLE CONSTRUCTION IN TEST BOILER.

The conditions which made this solution of the problem possible were as follows:—The Toledo Furnace Co. installed a by-product coke oven, and contracted to sell the entire gas output to the Atlas Chemical Co. The latter concern, under its contract, is receiving about 9,000,000 cu. ft. of rich gas each 24 hours in excess of its needs. The chemical company needs only the lean gas for its operations. Therefore the rich gas, which has an average heating value of about 600 B.T.U. per cubic foot, and which is the "first-run gas" from the ovens, is being delivered to the Toledo Railways & Light Co. through a 20-in. main, which is approximately four miles long.

Experiments were tried with several different methods of combining gas and coal firing, but it is now thought that burning coal and gas at the same time in the same furnace proves most economical, and a number of boilers have been equipped for this.

In the earlier experiments gas alone was fired, the flame being directed on to broken fire brick spread over the grate surface, in order to deflect it and prevent it from directly striking the tubes. This arrangement was successful up to 175 per cent. rating, but would not do for higher outputs. To increase the overload one boiler was equipped with a Dutch oven furnace, and 263 per cent. rating could be obtained, but the installation was inflexible.

Finally the gas was burned directly over the coal, a specially-shaped tile, with a 2½-in. gas inlet hole, being fitted in the front of the ignition arch, set so that the gas would be directed down against the coal. No air was admitted except that coming through the fuel bed.

A Stirling type boiler was employed, with 6,680 sq. ft. heating surface and 256 sq. ft. superheat surface; 200 lb. boiler pressure and 100 deg. F. of superheat. It was equipped with a Bailey boiler meter, and chain-grate stoker 10 ft. wide and 11 ft. 7 in. long, having 21.5 per cent. of air space through the links, and a speed of 4 in. to 9 in. per min.

The gas burner consists of a 1½-in. pipe, with a cap drilled with seven 7/16-in. holes, inserted in the hole in the tile.

Five tests were made, some of them being check tests, on coal, coal and gas, and gas firing, and the results are tabulated herewith:—

COMPARISON OF BOILER PERFORMANCE BURNING COAL AND GAS SEPARATELY AND COMBINED.

	Coal alone.	Coal and gas.*	Gas alone.
Pounds of coal used per hour	1,374	1,426.3	—
Pounds of equivalent coal used per hour	—	1,278.5	2,006
Equivalent pounds coal burned per square foot of grate surface	37.8	49.1	17.45
Cubic feet of gas burned per hour	—	29,163.0	47,785.00
Cubic feet of gas burned per pound of dry coal	—	6.61	—
Per cent. of ash and refuse to total coal	18.80	21.43	—
Per cent. of rating developed	162.25	213	88.7
Temperature of flue gases leaving boiler (in deg. F.)	640.1	683.5	516.6
Draught over fire	0.363	0.2875	0.0316
Draught in uptake under damper	0.920	0.820	0.0573
Efficiency of boiler grate and furnace in per cent.	61.4	61.6	72.95
Efficiency of boiler and furnace in per cent.	66.1	68.9	72.95
Pounds of combustible in ash	385.7	517.9	—
Per cent. combustible in ash to total coal burned by weight	8.8	11.7	—
Speed of chain in inches per minute	6.64	6.94	—
Cost to produce 1,000 lb. of steam from and at 212° F. (in cents)	11.65	12.58	14.10
HEAT BALANCE—per cent.:			
CO ₂ in flue gas	10.43	12.37	6.75
O in flue gas	10.50	4.85	7.85
N in flue gas	79.07	82.78	85.40
Over ventilation	102.0	29.1	53.5
Heat absorbed by boiler	61.38	61.62	72.95
Loss by moisture in coal	0.34	0.30	—
Loss by burning hydrogen in coal and gas	4.13	6.16	12.58
Heat lost by dry chimney gases	16.87	13.72	9.59
Heat lost by unconsumed carbon in ash	2.50	9.76	—
Heat lost by apron water	0.72	0.59	0.15
Heat unaccounted and unaccounted-for losses	7.06	7.85	4.73

* Average of two tests.

† Average of one test.

Practically equal amounts of coal were burnt with and without gas, so that the additional rating was due to the gas. The additional rating was 31 per cent. over that with coal alone.

The temperature of the flue gas leaving the boiler was 43 deg. F. higher with combined firing than with coal. Better results were obtained with a lower stack temperature with combined firing than with coal firing; the efficiency of boiler, furnace, and grate were a little higher in the former case, also the amount of combustible by weight in the ash was greater than with coal alone.

Owing to the low ultimate CO_2 (10.8 per cent.) obtained by complete combustion of coke-oven gas, the ultimate CO_2 from the combination firing was lower than for coal alone.

The results showed that the cost of evaporating 1,000 lb. of water from and at 212 deg. F. is 8 per cent. higher for

GAS-NOZZLE TILE USED IN TEST BOILER.

combined firing, and 21 per cent. higher for gas firing than for coal alone. The company, however, obtained, with combined firing, 31 per cent. added capacity for the 8 per cent. increase in cost, and at 50 per cent. less investment than would have been required with coal.

IMPEDANCE OF STEEL RAILS.

In the design and operation of alternating-current traction systems in which rails are used as electrical conductors, accurate knowledge of rail impedance is of no little importance. In order to add to this knowledge, the research division of the electrical engineering department of the Massachusetts Institute of Technology has conducted a research to determine, by direct measurement, the impedance offered to alternating currents by standard steel rails of various shapes and sizes, and also to ascertain how this impedance varies with frequency and with current strength. Furthermore, it was desired to find, if possible, a simple theory by means of which the rail impedance can be calculated from physical data concerning the steel used in the rails and from the dimensions of the rails.

The rails employed in the tests were of standard length, 33 ft. (10.07 m.), and ranged in weight from 60 lb. to 100 lb. per yard

FIG. 1. EQUIVALENT SKIN DEPTH OF ALTERNATING CURRENT PENETRATION OF STEEL RAIL.

(30 kg. to 50 kg. per m.). Frequencies of 25 and 60 cycles per second were used; a few tests were also made at 15 cycles per second. The rail current strengths employed varied from 10 amperes to 800 amperes R.M.S.

In order to obtain the results desired, it was necessary to measure, in addition to the direct-current resistance, the alternating-current voltage drop and current in the rail and the phase angle between them. The alternating current potentiometer was found most satisfactory for these particular tests.

The ratio of alternating-current resistance to direct-current resistance, called "resistance ratio," was found in practically all cases tested to reach a maximum value within the limits of rail current from 10 amperes to 800 amperes R.M.S. This maximum value of resistance ratio, at 25 cycles per second, was observed to vary between 5.3 and 10.1 for 10 track rails and between 10.9 and 13.4 for two contact rails. For most rails the lowest observed value of resistance ratio of a sample was from 40 to 60 per cent. lower

than the maximum value for that sample at constant frequency, the reason for this large range of resistance ratio being the variation in the permeability of the steel at the various flux densities corresponding to different strengths of rail current.

The equivalent skin depth of alternating-current penetration—defined as the thickness of uniform rail skin which would offer the same resistance to a direct current as the entire section offers to an alternating current—was found, by calculation from the experimental results, to be 1.5 mm. ($\frac{1}{16}$ in.) for a typical rail at 25.5 cycles per second and at maximum permeability. (See fig. 1.)

The maximum observed skin-effect resistance ratio was found to vary substantially as the square root of the impressed frequency between the limits of 25 and 60 cycles per second.

The self-inductance of the rails was also found to increase, with increasing current, and to reach and pass a maximum value, for current strengths up to 800 amperes, the total change of inductance varying, for the different rail samples, from 15 to 30 per cent. approximately.

The rail inductance is greater at 25 cycles per second than at 60 cycles per second, but the rail reactance at 60 cycles per second is greater than that at 25 cycles per second.

From the experiments conducted, it would seem that the skin-effect resistance ratio of a rail to a given alternating-current frequency and current strength can be approximately calculated by a simple formula involving measured values of direct-current conductivity and permeability of the steel, the area of cross-section of the rail, the rail perimeter, and an experimentally-determined factor to cover certain discrepancies. This factor appeared to be not more than 1.3 at the maximum skin-effect ratio.

The complete report on the investigation, entitled "Experimental Researches on the Skin Effect in Steel Rails," by A. E. Kennelly, F. H. Achard, and A. S. Dana, is available as Research Bulletin No. 12 of the Electrical Engineering Department, Research Division of the Massachusetts Institute of Technology.—*Electrical World*.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

The Teagle Ignition Magneto.

It is not only in this country that increasing attention is being devoted to the manufacture of high-tension magnetos for automobile ignition purposes, in order to make sure that enemy-produced machines shall never again dominate the market as they did in pre-war days. It is the same in the United States, where not only are the older magneto makers extending their factories, but several new magnetos have recently made their appearance. Among the latter is the Teagle, made by the TEAGLE CO. of

FIG. 1.—MAGNETIC CIRCUITS, TEAGLE H.T. MAGNETO.

Cleveland, Ohio, and of which we are this week able to give some particulars.

The new machine, which has been specially designed for use in connection with the engines of industrial motor vehicles and tractors, is of the inductor type, in which the coils in which the current is induced are stationary, the only rotating parts being the distributor arms and gears, and the shaft with a laminated rotary armature attached to it. There are no moving wires, slip rings, or brushes, with the exception, of course, of the collector brushes in the distributor. The quality of metal used in magneto manufacture has much to do with the efficiency of any given design, on the one hand, while, on the other, the technical difficulties encountered in connection with the working up of the material renders simplicity of design a fundamental of magneto quality and efficiency. It is claimed that this is a special feature of the Teagle magneto, as, instead of being of the usual horseshoe pattern, the permanent magnets are of the bar type, which can be easily ground with the requisite accuracy, and also heat-treated; the magnets are

securely clamped to top and bottom yokes of grey iron, and of liberal section. The field is formed, bored, and ground as a single piece to ensure true alignment of the bearings and pole faces: and the stationary coil, condenser, and laminated pole-piece are likewise assembled as a unit, and mounted integrally with the top. The bottom yoke forms a pole-piece extending nearly half way round the rotor tunnel, while the top yoke has two poles, one carrying the windings or coils, and the other serving as a magnetic by-pass.

The magnetic circuit is shown diagrammatically in fig. 1; in one case, the rotor-pole is shown opposite the pole of a top yoke, which carries the coils, and, with the rotor in this position, the maximum flux passes through the coils. In the other case, the rotor is shown opposite the end of the magnetic by-pass, and in this position all the magnetic flux passes through the by-pass, and none through the coils. As the rotor has two poles, the flux through the coils passes through a maximum, and a minimum twice every revolution of the rotor. Another feature of the machine is the unidirectional direction of the current—that is to say, the same electrode is always the positive, this being due to the special characteristics of the magnetic flux. The further result of this unidirectional direction is that the current goes to build up, instead of to weaken, the strength of the magnets. Again, there is no break in the magnetic flux, with its resulting electrical wear and

The manner in which the luminous radiation from the hot body is balanced against that from a standardised source will be understood by reference to fig. 1. *L* is a lens by which rays from the hot body are brought to a focus in the plane *F*, where there is located a tungsten lamp filament. By means of the eyepiece *E*, the observer views the incandescent filament, which appears to lie upon the image. By means of a rheostat in a case slung about the neck, the case also containing a storage battery and milliammeter, the current through the lamp is adjusted until the brightness of the filament is just equal to the brightness of the image produced by the lens, so that the filament becomes indistinguishable upon the background formed by the hot object. The observer then notes the reading of the milliammeter, which may be provided with a special scale to read in degrees of temperature, or the temperature corresponding to the current may be read from a calibration curve.

The adjustment is made with great accuracy and certainty, as the effect of radiation upon the eye varies some 20 times faster than does the temperature at 1,300° F., and some 14 times faster at 3,000 F.

At high temperatures the light emitted by both the hot body and the filament would become dazzling and comparison would be difficult. For this reason a red glass is placed in the eyepiece at *n*,

which has the further advantage that light of only one colour then reaches the eye, and no difficulty is introduced by lack of colour identity between the light emitted by the hot body and that emitted by the filament. The intensity of light radiation of any one colour increases progressively in a definite manner as the temperature of the radiating body rises, and nothing is therefore lost by eliminating all other light from the comparison. As only brightness, not colour, of light is matched, inability to distinguish colours and colour-

FIG. 3.—TEAGLE MAGNETO.

FIG. 4.—SECTION THROUGH PYROMETER, ALSO ELECTRICAL CIRCUIT.

tear, as the flux starts from the magnets, flows up on each side, through the head casting, down through the laminated pole-piece, then through the stationary coil, thence through the vertical (flux) distributor to the base, and, finally, to the lower ends of the magnets. Now, as the distributor to the sparking plugs revolves, it leaves the segment of the laminated pole-piece, extending through the coil, and comes into proximity with the by-pass, through which the flux passes, instead of through the coil, its path being otherwise the same as before.

The plain bar shape of the magnets, of course, facilitates the calculation of the ratio of the cross-section to length in order to obtain the best efficiency, a result that is further assisted by the unidirectional of the current owing to the re-magnetising instead of de-magnetising action thereof. The coils, too, are so proportioned as to minimise all tendency to surging and high-frequency oscillation; and being stationary, there should be no mechanical strains set up by centrifugal action.

The circuit-breaker and the distributor, which are the only parts requiring occasional attention, are both readily accessible for cleaning or adjustment. The electrical connections are protected by insulating material, and excess voltage strains are obviated by an enclosed safety gap, which is visible and readily accessible. The metal of the distributor gears is, as usual, of steel and bronze, while the bearings for the gears are cast integrally with the front die casting. Two sparks are produced per revolution, the sparks having high-initial voltage, and of sufficient duration to ensure complete combustion.

The Teagle magneto is made in two types, in both of which the simplicity of design and construction is claimed not only to result in mechanical and electrical advantages, but to permit comparatively cheap cost of manufacture, notwithstanding the high quality of the material and workmanship. Both types of machine are claimed to be proof against the action of water, dust, and oil, and, as they can be fitted with impulse starters, the hard work of quickly starting up high-powered engines is eliminated.

An Optical Pyrometer.

The eye is very sensitive in comparing the brightness of two surfaces when one is superposed upon the other, and after having arranged to have light from a hot body and light from a standard of comparison viewed in this relation, they can be made equal by varying the intensity of the standard of comparison.

The LEEDS & NORTHRUP Co., of Philadelphia, working under the fundamental Morse patents, has lately developed this type of optical pyrometer. The instrument is suitable for measuring from dull red (about 1,100° F.) up to the highest known temperature.

blindness does not interfere with the use of the instrument. In fact, in the region of temperatures used for hardening steel, for example, different observers using this instrument are said to agree in their readings within 6° Fahrenheit.

The brightness of the image of the hot body produced by the lens *L* is almost constant, irrespective of the distance from the hot body, although the size of the image varies with the distance. Since it is the brightness of the image and not the total radiation received through the lens that is measured, it is possible to measure the temperature of a small body or of a body at a distance equally as well as that of a large body or one near at hand.

In observing bodies at very high temperatures, the light received through the lens would be too blinding for direct observation, even through the red glass of the eyepiece, and the intensity of the image might also become greater than that at which it is practicable to burn the tungsten filament, so that a balance would become impossible. Therefore a screen is used, placed between the lens and the image so that it reduces the light from the hot body, but not that from the filament. The screen can be thrown into or out of the field of view by means of a milled disk projecting through an opening in the tube of the instrument. With the absorbing screen in use, a different milliammeter scale or calibration curve is required; but as the range of the instrument without the absorbing screen overlaps by many hundred degrees the range with the absorbing screen, the accuracy of the two scales can always be checked by observing a hot body whose temperature lies within this range.

The constancy of the lamp has been investigated exhaustively by the United States Bureau of Standards and by the National Electric Light Association, also in the laboratory of the Leeds and Northrup Co., and it has been found that after a tungsten filament is thoroughly aged—that is, burned for some time at a temperature higher than that to which it will be subjected in service—no sensible variation occurs. The instrument is so designed that one lamp can quickly be replaced by another, and by keeping two lamps, their correctness can be insured by checking one against the other.

The instrument itself is handy and portable, weighing but a few ounces, and can be sighted as easily as an opera glass. The case containing the battery, rheostat, and milliammeter weighs about 10 lb.—*Power*.

Engineering Wages.—The executive of the Federation of Engineering and Shipbuilding Trades has placed on record a protest as to the inadequacy of the 3s. award which came into operation on August 1st.

ELECTRIC POWER FOR STEEL MILLS.

The following has been taken from a report of the Central Station Power Committee of the AMERICAN ASSOCIATION OF IRON AND STEEL ELECTRICAL ENGINEERS.

The power requirements in steel mills generally range from 1,000 to 10,000 kW. or more. A fair average is about 4,000 kW. The load is characterised by large peaks. Where alternating current is used the power factor will vary from about 65 to 80 per cent. Large generating capacity is required to provide service of the proper regulation. Table I has been compiled from data obtained from a number of steel mills, and shows the generating capacity actually installed, together with the connected load in motors and lighting.

In all large modern central stations the power is generated and transmitted as alternating current at a high voltage. At the receiving end of the transmission line this power must be transformed down to at least two, and generally three, lower voltages, namely, 6,600 or 2,200, 110 or 220, and 110; and where direct current is used it has to be converted from alternating to direct current. The 6,600-volt or 2,200-volt current is used for driving the motors of the motor-generator sets, also the large motors driving the mills and some of the larger auxiliaries (say from 100 H.P. up for the 6,600-volt and 50 H.P. up for the 2,200-volt) for driving pumps, fans, blowers, &c., in situations where these voltages can be used without danger.

TABLE I.—INSTANCES OF GENERATING CAPACITY ACTUALLY INSTALLED.

Generating capacity.			Connected load.			Energy.	
Total kW.	No. of units.	Largest unit.	Motors. No.	Motors. Total H.P.	Light. kW.	Total kW.	kW.-hours per year.
10,400	8	3,500	950	49,790	750	44,565	27,072,000
1,650	3	550	202	6,870	125	6,171	4,325,000
9,503	8	2,500	730	26,570	490	23,871	38,725,000
10,650	8	2,000	464	20,640	490	18,653	30,548,000
6,450	8	3,000	1,280	37,730	750	34,005	18,950,000
15,400	11	2,500	252	9,787	146	8,759	73,117,000
2,000	5	400	400	11,525	563	10,705	9,970,000
2,200	4	550	204	4,531	120	4,106	5,432,000
2,150	4	550	398	13,117	220	11,763	7,594,000

For the remaining auxiliaries the voltage is further reduced to 110 or 220 volts. Motors wound for these voltages have a wide range of application, covering almost all classes of service in the mill, especially where constant-speed characteristics are required. For lighting, 110 volts is generally used and transformed from either of the above voltages. In all of the above transformations a certain percentage of power is lost. In some contracts the purchaser pays for all transformation losses; in others, the power supply company pays for the losses of the first transformation and the purchaser for all others. A summary of the losses is given in Table II:—

TABLE II.—PERCENTAGE OF LOSSES INCURRED IN TRANSFORMATION, &c.

	Original power delivered.	Losses from line to 6,600, or 2,200 volts.	Losses from H.P. trans- former to feeder station.	Losses 6,600 or 2,200 volts to 110 volts.	Losses 440 volts to 110 volts.	Losses in con- version.	Net power deli- vered to feeder station bus- bars.
Mill drives...	100	2.5	7.5	—	—	—	90.2
Alternating-current auxiliaries...	100	2.5	7.5	2.5	—	—	87.9
Lighting...	100	2.5	7.5	2.5	3	—	85.2
Rotary converters...	100	2.5	7.5	2.5	—	5	83.1
Motor-generator sets...	100	2.5	7.5	—	—	12	79.4

The 110 or 220-volt alternating-current auxiliaries can be used in almost all applications where direct-current power is used, the exceptions being where variable speed and dynamic braking are required. The direct-current motors are so much better adapted for this class of service that the disadvantage of greater conversion loss is more than compensated for by their flexibility and adaptability. Direct current will be used for cranes, tables, charging storage batteries, electrolytic work, and variable-speed motors especially those used for driving machine tools.

The alternating current is suitable for driving fans, pumps, hot saws, cold saws, conveyors, straighteners, and drill presses, but is not favoured for table drives. In general, the use of alternating-current motors is recommended where constant-speed, non-reversing conditions obtain, and the direct current where large starting torque, quick-reversing and acceleration, variable speed or dynamic braking are required.

The ratio of alternating current to direct current used will vary greatly in different plants. In general, in those plants where power is purchased and where there are many cranes and variable-speed drives, direct current will probably predominate for auxiliaries about in the ratio of 60 per cent. direct current to 40 per cent. alternating current for voltages of 110, alternating current, or less and of 250, direct current. *Iron and Coal Trades Review.*

TRADE STATISTICS OF EGYPT.

The following statement, showing the imports of electrical and similar goods into Egypt during the year 1916, is taken from the recently-issued trade statistics. The figures for 1915 are added for purposes of comparison, and notes of any increases or decreases are given:—

	1915. £E.	1916. £E.	Inc. or dec. £E.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Underground Signalling Bells.

In your issue of July 27th, 1917, and in previous issues, I have read articles on underground signalling bells, describing various methods of minimising the danger from sparking at the signalling station. These methods range from gas-tight switches placed at intervals along the haulage roads, to specially-wound bells or relays requiring a minimum current for operation.

In no case has any suggestion been made to actually suppress all danger of sparking at the point from which the signals are sent, and it will doubtless interest you to learn of a method of doing this, which I invented in 1914, and which will be placed upon the market at the conclusion of the war by Messrs. Gent & Co., Ltd., of Leicester.

With my method, the usual system, as installed, is retained, having bare wires along the haulage road, the signals being sent by bridging across the wires with a knife, or other suitable conductor. The only alteration is the addition of a special relay near the bell, which has for its function the transference of all sparking to the trembling contacts of the bell itself.

In the accompanying sketches, fig. 1 shows the signal system as usually installed, and fig. 2 shows the alteration by the addition of the special relay.

FIG. 1.

FIG. 2.

This special relay is constructed on the lines of a telephone transmitter, having a very high period of vibration, and consequently able to close or open its circuit in the shortest possible space of time; it is connected with the operating coils in series with the bell, and the contacts are arranged to short-circuit the signal wires. When the signal circuit is closed, by a knife or other means, the relay will vibrate in synchronism with the bell hammer. Sparking can only take place on the signal wires if the current is broken there; therefore, let us follow what occurs when the signal wire circuit is opened at any period during one complete stroke of the bell:—

When the bell-hammer is against the gong, the bell circuit is broken at the trembler contacts, consequently no current is flowing through the circuit, and no spark can take place when the signal wires are separated. When the hammer is away from the gong, and the trembler contacts are together; then the signal wires are short-circuited by the relay contacts, and the current for the bell passes through the relay, and not through the signal wires, consequently they may be separated without any sparking taking place. The only time that current flows through the signal wires is during the extremely short period of the lag in action of the relay, and this period is so short (less than 1/1,000 second) that even a hack-saw blade, or a file, may be rubbed across the signal wires with no danger of a spark taking place.

With this relay, all current is broken at the trembler contacts of the bell, and full provision can be made there for their protection against inflammable gases or coal dust. Practically no alteration is required to existing installations, and either alternating or direct current may be used. It should be noted, however, that it can only be used with trembler bells.

In some cases it may be advisable to place a small resistance, as indicated, in series with the signal wires, but the experiments already carried out show that it is not an actual necessity.

A. W. Brown,

Lieutenant, 3rd Manchester and R.F.C.

Prisoner of War, interned in Switzerland.

August 4th, 1917.

The 10-Mile Limit.

Can you kindly let me know what a disengaged (non-eligible) man is to do? If he lives 10 miles away from a berth, he is not allowed to apply. D.O.R.A.

As I am residing in a non-electrical town, have I got to wait till the war is over?

Wolverhampton.

[The local Labour Exchange should be able to advise our correspondent. Otherwise, we recommend a change of residence (duly notified to the authorities).—Eds. ELEC. REV.]

Staff Organisation in Electricity Works.

The recent letters and articles in the REVIEW on electricity works staff have greatly interested the writer, who is engaged in electric supply work. The last article, by Mr. Stubbings, has called for these few remarks.

With most of this article I am in agreement, particularly as to exaggerated ideas of the importance and status of sales managers. Even in much larger stations than 10,000,000 units per annum, I think these officials are regarded as far too important, especially in comparison with the engineering staff. Concerning this latter staff—and chiefly in the generating department—a little mild criticism may be acceptable.

I would maintain that the engineering assistants should possess the necessary scientific technical knowledge to tackle any problem which may arise in the operation of a supply system. At present there are certainly few men in positions of authority in British stations who have the requisite qualifications and scientific ability. There seems to be a tendency for chiefs to unduly favour marine engineers for the position of station superintendent, and they, in their turn, favour marine engineers as their mechanical assistants. With due respect to the qualifications and ability of these men, so far as marine work goes, it is not a satisfactory state of affairs in power-station work. In station maintenance and routine work they generally give satisfaction; but even in the investigation of structural, mechanical, and steam problems they rarely show sufficient aptitude, whilst in electrical matters their confusion of ideas is notorious.

The new position, which Mr. Stubbings proposes, would be rather difficult to introduce into many stations. Most station and mains engineers would resent the incursion of the new official into their domains. But if, due to lack of scientific training of the existing engineering staff, such an official were appointed, I consider he should be looked upon as more than a "glorified meter superintendent." His work should be of far greater scope than Mr. Stubbings proposes—fuel, water, and instrument testing. His status should be higher than station or mains engineer in order to remove any difficulties as to supposed "trespassing" of the technical assistant in their respective fields. Why not give him the status of the old-time chief assistant? Surely, his qualifications and his value to the undertaking merit it.

Such men are obtainable, and can be found filling junior positions in many stations where little respect for their training or ability is accorded them. They languish through restriction of their scope, and after getting wholesomely satiated with many years of shift or routine work, finally leave the electric supply industry. Perhaps they enter the estimating department of a manufacturing concern. Often they go into technical teaching (wherein such a man may be considered as lost to the engineering profession) or otherwise vanish into a charitable obscurity.

Considerations of space restrain me from giving detailed reasons for the above opinions, and from taking up other aspects of the subject equally interesting and important. I trust this expression of ideas may stimulate further discussion.

Engineer.

Employment of Disabled Soldiers.

I should like to put in a remark or two re the "insult to wounded officers" in offering them positions in power houses and sub-stations, which I notice "E. M. F." and Mr. Bridges has so ably contested.

Being an ex-sub-station man myself, for the present serving in the Navy in an electrical rating, I think I am in a position to assure you that very few officers have a fraction of the responsibilities of the man in charge of a large plant ashore. It seems to me that their whole ability is concentrated in enforcing and interpreting discipline, and that any deftness or engineering skill is rarely expected of them.

Therefore, these men need feel no lowering of their dignity in accepting a job in a power house; rather, in fact, they ought to feel that they have been given yet another chance of demonstrating their nerve and discrimination.

I am burning to give a few details of the typical old woman's jobs the officers in most cases have, but, having to maintain secrecy, I will conclude by saying that the power supplies require staffs consisting of the smartest and most experienced men, and any wounded officer who is given the privilege of helping to run one should consider that he is still doing his bit, perhaps even more than most of his comrades in the Services.

I think that the REVIEW should have been less hasty in decrying so well-recognised a branch of the electrical profession, which is unfortunate enough to be so badly paid.

D. F. Barton.

August 24th, 1917.

Brighouse.—Mr. A. J. Ashton, K.C., has sat as arbitrator in the matter of Corporation employes' wages. The men had demanded an increase of remuneration bringing them to an advance of 12s. per week on pre-war rates: the Corporation offered only 10s.

WAR ITEMS.

Exports to China.—The "London Gazette" for August 25th contains some further names of persons and bodies in China to whom exports may be consigned.

Import Prohibitions.—By a Proclamation dated August 22nd, the importation of the following goods is prohibited:

All machinery driven by power and suitable for use in cutting, working, or operating on wood (as set out in the Proclamation).

Electrical motors up to $\frac{1}{2}$ H.P.

Export Prohibitions.—The "London Gazette" for August 28th contains particulars of certain alterations in the Schedule of Prohibited Exports. The following heading is deleted:—(A) Telegraphs (including wireless) and telephones, and instruments and material for; and in its place there is substituted:—(A) Telegraphs (including wireless) and telephones, and instruments and materials for, including valves for wireless telegraphic apparatus.

The Trade Press and War Loans.—We have received from Mr. Walter Judd, of Messrs. Heywood & Co., Ltd., a communication expressing the opinion that the technical Press has never received from the Government the recognition that it deserves, and suggesting that those responsible for Government publicity should make use of such organs as mediums for appealing to the great industrial classes when next inviting applications for War Loans.

Cost of Electric Railway Materials in U.S.A.—The *Chronicle* (U.S.A.) quotes from the "Weekly News Letter" of W. S. Barstow & Co. (July 11th) a reference to an article in "The Pretzel," published by the Reading Transit & Light Co., with regard to the increase in the cost of materials essential to public utilities operating electric railways and central stations. The article reads:—

"In a recent issue we called attention to the great advance in prices of some of the materials necessary in the operation of electric power and railway systems. We mentioned coal costing us \$200,000 more this year than last, and increases of \$80,000 in the annual payrolls of our employés, and an advance of 44 per cent. in the price of steel rails.

"But we were merely scratching the surface. Copper wire, electrical machinery, and a multitude of other things used in constructing, renewing, repairing, operating, and keeping our properties up to the high standard of efficiency which the public demands, are costing a whole lot more than they did two years ago.

"We also must face the handicap of being compelled to place orders for materials from three months to two years ahead of time of delivery. Some materials can scarcely be procured at any price. Steel car wheels, for instance, have practically disappeared from the market. They were last heard of at \$18 a piece, but for some time it has been impossible to get anybody to quote a price on them: Cast-iron wheels are selling at \$1 80 per 100 lb., on big contracts, compared with \$1 45 two years ago, an advance of about 25 per cent.

"We have noted some figures at random from our purchasing department showing the sharp advance in prices of some materials to-day, compared with two years ago.

"Rails have increased 100 per cent. over normal prices. To-day they are quoted at \$55 a ton for delivery a year hence, and for short-time delivery the price is \$75 a ton. Two years ago steel rails were selling at \$38 20, so that what is regarded as the normal price to-day is an advance of 44 per cent. There is an even greater advance in special track work, which means curves, switches, and the like, the increase in these materials being fully 200 per cent.

"Copper that is required in large quantities for repairs to trolley and electric equipment has nearly trebled its normal price. Copper trolley wire is now quoted at 38 cents a pound, compared with 17 cents in 1915. Copper feeder cable has advanced from 18 cents to 34½ cents a pound in the same period.

"Motor equipment has advanced over 50 per cent., and following are some of the other advances:—

	1915.	1917.
Track spikes...	\$2 15c. per 100 lb.	\$4 per 100 lb.
Steel trolley poles ...	\$1 10c. each.	\$2 10c. each.
Track plates...	2½c. pound.	10c. pound.
Steel and iron bars...	1½c. pound.	4½c. pound.
Cotton waste ...	9c. pound.	13c. pound.
Chestnut ties ...	10c. each.	60c. each.
Cement ...	\$1 29c. barrel.	\$2 9c. barrel.
Gravel ...	\$1 25c. ton.	\$2 ton.
Crushed stone ...	50c. ton.	\$1 ton.

Dilution of Labour and Munitions.—According to an official statement, the Minister of Munitions (Mr. Churchill), accompanied by Mr. Kellaway, Major J. W. Hills, M.P., and officials of the Ministry of Munitions, the Admiralty, and the Ministry of Labour, met representatives of the Engineering and Shipbuilding Trades' Federation at Westminster on Wednesday last week. Mr. Churchill explained to the delegates that the principal object of the meeting was to set up an Advisory Committee of Trade Unionists, the appointment of which had been discussed at previous conferences. He ex-

plained the circumstances which had led to his proceeding with the Munitions of War Bill. He stated that, having gone, as he thought, a long way to meet Labour in his action with regard to the Bill, he felt he could now fairly ask Labour to help him. He appealed particularly for assistance from the trade unions in the enrolment of an increased number of war munitions volunteers, and in seeing that dilution on munitions work was carried out to a fuller extent than at present. He would be glad to have the views of the conference on the setting up of works committees. A friendly discussion followed.

Coal Shortage in Germany.—The "Times" publishes the following dispatch, dated August 26th, from its Amsterdam correspondent:—

"Herr Helfferich, in a speech on Germany's coal difficulties in the Reichstag Main Committee on Friday, said that the maintenance of coal production at the present output demanded uninterrupted and intense labour. Especially there must be no strikes, such as unfortunately occurred last month in Upper Silesia. Every strike deprived the front of munitions and the home of the necessary domestic fuel. The Imperial Commissioner for Coal Supply gave a long explanation of the proposed methods for coal saving, stating plainly that the coal supply was inadequate to the demand. War industries, he said, must be first supplied, and less important consumers must suffer restriction. No system of distribution was possible without hardships. Apart from technical difficulties in the way of greater output, there were difficulties connected with labour, the number of miners being fewer, and their working capacity diminished. In the debate, a member of the Centre said that the average working capacity of miners was less, and was partly due to malnutrition. The strike in Upper Silesia had caused a falling off of about one million tons, which could hardly be made up by withdrawing miners from the front. Industry was of opinion that proper measures would have ensured sufficient coal for an average winter, and that lack of foresight had caused the present situation. The stoppage of works now ordered was the cause of extraordinarily great injury to industrials. The measures contemplated against the smaller industries were simply shocking."

Exemption Applications.—Middleton Tribunal has given conditional exemption to a permanent-way repairs labourer (37, C2), appealed for, on account of the shortage of labour, by the Electric Traction Co.

At Aberdare, the U.D.C. appealed for Mr. A. J. Abraham (41), chief engineer and tramway manager, and he was given six months on condition that he continues in the same occupation.

At Oxford, Messrs. Wyatt & Son, of St. Giles, appealed for E. Green (35, C1), engaged on electrical work. He was given two months' temporary exemption.

At Maidstone, Mr. Micklewright appealed for the retention of E. R. Edwards (27, B1), electrical engineer, and he was given three months, with the Volunteer condition.

Hull Appeal Tribunal has dismissed Military appeals against exemption held by four drivers on the Corporation trams, and in a fifth case exemption until September 1st was substituted. It was stated that women drivers were not able to bear the strain, and that the Amalgamated Association of Tramway and Vehicle Workers was opposed to women drivers.

As the result of a Military appeal, exemption granted until November 23rd to an electrical engineer (39, B1) with the Brandon and Byshottles Co-operative Society has been made final.

Surrey Appeal Court has granted three months' exemption to E. Lown (31, Class A), electrician, appealed for by Messrs. A. E. Read & Co., Farncombe Paper Mills.

On the appeal of the Military, Faversham Tribunal has cancelled conditional exemption held by E. R. Epps (34), switchboard attendant at the Corporation sewage works. He is not to be called up until October 13th.

With the assent of the Military, three months' exemption has been granted to C. W. Read (36), shift engineer at the Reigate Corporation electric light works.

At Aylesbury, Messrs. Mackrill & Sons appealed for T. Pearce (40, Class A), electrical engineer, on the ground that he was indispensable, his work including an installation at the Royal Bucks. Hospital. The Tribunal gave conditional exemption whilst working at the hospital.

The Military applied at Bexley for the withdrawal of certificates of exemption held by M. M. V. Roots (32, B1) and H. J. Sheridan (29, Class A), motormen on the U.D.C. tramways. It was stated that it was very important that the men should be retained on account of the fire at the Dartford tramway sheds. Owing to these circumstances, the Military Representative agreed to the appeals being resented.

At Battle, exemption was sought for C. D. Gear (32, A1), electrical engineer to Viscount Hythe, at Normanhurst Hospital. The appeal was resented for a month to see if a substitute can be found.

Derbyshire Appeal Court has refused exemption to the electrician at Aston Hall, appealed for by Colonel Winterbottom.

Before the Hants Appeal Court, the Bournemouth Electricity Supply Co. appealed for a switchboard attendant (18). The company stated that 130 employés were serving in the Forces, and only six of the 13 men of military age left were

in Class A, and a substitute could not be found for the man asked for. Conditional exemption was conceded.

At Sheffield, final exemption until September 30th has been granted to T. C. Pye (20, B2), electrical engineer.

At Brighton, a review was made of three months' exemption granted to an electrical engineer (38, C2), the Military contending that, although he was on munitions, he would be still more useful in the Army. The Tribunal decided to deal with the case again when the present exemption expires.

A Buxton firm of electrical engineers appealed for an electrician (33), the only man left available for work at hydros, hotels, and military establishments in the town. Lieutenant Kersley: "I know what electricians are, and that it is impossible to replace them." Exemption was granted until January 1st.

Cookham (Berks) Tribunal has refused a request for W. J. Windsor (35, C1), electrician at Stubbings, Maidenhead Thicket.

At Dorsetshire Appeal Tribunal, a discussion took place with regard to the position of Mr. C. B. Burnett, resident electrical engineer at Brechin electricity works, whose exemption had been cancelled by the Burgh Tribunal, with the proviso that a substitute should be provided by the Military authorities. An agent mentioned that an effort had been made by the authorities to substitute this man by a mechanical engineer, who was absolutely useless for such work, and he asked for a certificate of conditional exemption. Sheriff Neish pointed out that the onus was placed upon the Military authorities of providing an efficient substitute, and the local Tribunal's finding was confirmed.

REVIEWS.

Electric Traction. By A. T. DOVER, A.I.E.E., Lecturer on Electric Traction at the Battersea Polytechnic, London. London: Whittaker & Co. Price 18s. net.

This book professedly deals only with the technical considerations involved in the application of electric power to the working of tramways and railways, and is in the main a text-book for technical students, the outcome, doubtless, of the author's experience in his position at the Battersea Polytechnic. Nevertheless, the influence of financial considerations upon technical design, choice of plant, &c., is by no means ignored, and the effect of Board of Trade regulations on the same matters is duly weighed.

A commendable feature is that the book opens with a list of symbols, explanations of the conventions followed in diagrams, and a list of abbreviations, so that in any uncertainty the reader knows where to look for the meaning of the symbols used.

The introductory chapter gives short descriptions of the systems in use, with reference to practical examples, and tabulated data of the principal electric railways.

The advantages of electric traction on railways are shortly set out, and the principal difficulty in the way of main-line electrification is summarised as the excellent performance of the steam locomotive for fast passenger service, coupled with the cost of conversion.

In Chapter II, the mechanics of train movement, the fundamental "speed time" curve is introduced and studied. Typical curves for "city," "suburban," and main-line services are given, and stress is laid upon the differences in the proportion of acceleration, deceleration, and free running required, and the consequential differences in the motor characteristics needed for each. The importance of acceleration in short runs, and the limitations imposed on acceleration by the weight of equipment, peak load on stations, comfort of passengers, financial considerations, maintenance of rolling stock, and cost of energy, are well set out. The relation between acceleration and retardation, and the economic value of high retardation in saving energy by prolonging the coasting period permissible on a given running schedule is emphasised. The value and low cost of high retardation compared with a corresponding increase in acceleration is very clearly brought out. Actual obtained values are given, and the importance of correct design in this respect in relation to financial results is well shown.

The use of simplified speed-time curves for preliminary calculations is explained very clearly and fully, and the construction of such curves is illustrated with figured examples. In the course of this discussion the author gives adequate space to the importance of short stops on urban services involving short runs, showing the economy to be gained by cutting down the station time. The consistent use of the accepted term "schedule speed," i.e., the distance between stops divided by the time from start to start, and "average speed," distance between stops divided by time from start to stop, assists this exposition. The calculation of the minimum acceleration needed to obtain a given schedule speed, with given retardation, is demonstrated by worked out examples.

In the method adopted by the author, the relations between acceleration, maximum speed, average speed, and retardation are expressed in a form which has a rather complex appearance, and, in fact, involves some tedious arithmetic. For example, on page 12 the expression for maximum speed is given as:

$$V_m = \left(\frac{a \beta}{a + \beta} \right) t - \sqrt{\left(\frac{a \beta}{a + \beta} \right)^2 t^2 - 7.2000 \left(\frac{a \beta}{a + \beta} \right)}$$

Where V_m is maximum speed, a = acceleration in mile per hour per second, β = retardation in same units, V average speed in miles per hour, D = distance in miles between stops, T = running time in seconds. This formula gives correct results, but, unfortunately, in working out an example on page 25 an erroneous answer is printed—24 miles per hour instead of 25.8, probably a printer's error.

A somewhat simpler-looking and distinctly more easily computed expression can be derived from the simple geometry of the speed-time curve, and is here offered as an alternative. It is very easy to explain to a class on a blackboard:

$$V_m = V + \frac{V^2(a + \beta)}{a\beta} - 2 \left(T - \frac{V(a + \beta)}{a\beta} \right)$$

V being in this case the average speed.

It is a little curious that writers on this subject make so little use of the elementary fact that the area of a speed-time curve is the distance or length of run—so that all speed-time curves to the same scale between a pair of fixed points must have the same area—and the simple geometrical relations which follow. The author does use that elementary fact, and the full way in which the calculations are set out and their derivation explained is in refreshing contrast to the method one frequently sees in text books, where intermediate steps are silently omitted, on the apparent assumption that every reader knows his algebra as completely as if he were reading for the Tripos. The author's experience with students, the majority of whom cannot have such mathematical readiness, has stood him in good stead in all the mathematical portions of the book, and gives it special value as a work of reference.

From this, the reader passes to a description of the characteristics of continuous-current traction motors, and the way in which motors are selected to suit or fit the speed-time curves derived from the proposed schedule. This work is thoroughly well done, and the suitability of series, shunt, and compound-wound motors for various kinds of service is fully explained.

Illustrations and descriptions of the electrical and mechanical construction of various motors are given, with a considerable explanation of the evolution of the modern D.C. traction motor, and the reasons which have led to the particular materials and constructive features now in use. The mechanical part is as fully discussed as the electrical.

Single-phase and polyphase traction motors each have a chapter to themselves. Probably there is no other English book on the subject which gives such complete details of these two types of motors in all their variety. This is particularly true of the chapter on single-phase motors, which are, perhaps, less well understood by the average traction engineer than any others.

The same characteristic thoroughness of description and co-ordination between theory and design is continued through the chapters dealing with motor control. These chapters form the most complete account of electric traction equipment in these departments which has fallen our way.

In a chapter on regenerative braking, a good deal of information is given, and if this is not quite up-to-date in respect of continuous-current work—*e.g.*, nothing is said of the recent American railway developments—it must be admitted in extenuation that the best examples are of very recent date, and descriptions may not have been accessible at the time of writing. Enough is said to show the modern line of development.

The same characteristic of thoroughly detailed description pervades the remainder of the book. Chapters XIX, on the calculation of speed-time curves and energy consumption, XXIV, on overhead construction for tramways, XXVI, on feeding and distributing systems, and XXVII, on sub-station converting machinery and switchgear, may be specially commended, because they give detailed expositions of the principles involved, the material available, and practical methods of design involving economical considerations, in branches of the subject on which detailed and consecutive teaching is not very readily available.

The book is, on the whole, a valuable compendium alike for the student of electric traction engineering and for the engineer in practice, a text-book and hand-book in one. There is very little room for criticism, and it can be thoroughly recommended for both uses. Naturally, it must fall out of date as a hand-book of current practice, that is inevitable in an art which is advancing so rapidly as electric traction; the remedy is later editions, which ought to be called for in a reasonable time.

The illustrations are copious, well selected, and well presented. The line drawings are particularly good, and many of the photo-blocks much clearer in detail than the average of such illustrations.—H. M. S.

"SYSTEM."

[COMMUNICATED.]

EVERY successful business undertaking is dependent for its success upon the adoption of some form of system in the organisation and control of its various departments and the work that they carry out. To the electrical engineer or manager of an electric supply undertaking, therefore, devolves the necessity for formulating a general system for the efficient working of his department, and for the preservation of accurate and accessible records of the growth and working conditions of his particular undertaking.

That such arrangement will necessarily involve many intricacies foreign to many ordinary business concerns will be at once apparent to all who have had experience in the management of an electric supply department, or who have made a careful study of the facts and figures relating thereto, and, for this reason, there is a grave danger that the electrical engineer who is not the possessor of a keen business ability will fall into the error of adopting a system that is either not complete, or, on the other hand, too complete. Each is as bad as the other.

System, like armour, may be made so heavy that all freedom of motion is lost; whereas, on the other hand, it may be so elastic that it fails to afford the protection that is duly expected from it. Yet it is possible to point out undertakings that are suffering under either one or the other of these evils. A system which cannot be relaxed to meet special conditions, but is most rigidly adhered to in all circumstances, is "red tape," the abhorrence of so many of our Government Offices in past days, and has been the means of losing many a good consumer of electricity. It has often occurred that a prospective consumer has required current very urgently at short notice, but this has been denied him on account of the formalities necessary before such supply could be given. He then applies to the local gas company, who are usually only too anxious to meet his requirements, and thus add another to their already long list of consumers literally snatched from the hands of their electrical competitors. Gas companies seem to have a happy knack of securing very alert business men to manage their affairs. The true explanation may lie in the fact that most gas companies are privately owned, and that their managers are, therefore, more free to speculate in the company's interest than is the tied engineer of a Corporation electricity department, who can do little in this way without the consent of the Electricity Committee. Be that as it may, the fact remains that many an electrical consumer has been absolutely sacrificed on the altar of system.

Against this must be recorded the case of the consumer of electricity who was actually connected and using the light for nine months before the fact was discovered. The system in this case was capable of too much relaxation, and consequently a temporary connection was made late one evening, unauthorised by any head of the department, and remained temporary, without a meter, for almost a year.

Too much centralisation in the management of the affairs of a supply company is, as a rule, the result of over-systematising the concern. In such a case, the concern is rarely a "going" one, for no matter how clever or how keen the chief may be, it is almost beyond human possibility for one brain to organise and control every detail in an undertaking of any size. Under the chief, therefore, must be appointed responsible assistants to whom must be entrusted the arrangements for the proper carrying out of the work.

The chief who says that no information must be given except by himself or through the office, is centralising the work too much, and the assistants under him must feel very small when asked a question, to have to reply, "I must not—or cannot—give this information, but the chief will answer any question if you care to write to him." At the same time, it is not advisable to allow every man employed to answer any question that may be put to him, for if this is permitted, a great deal of time and trouble is likely to be taken up in correcting false or incomplete information.

Rules and regulations for the guidance of officials and workmen are, in their way, excellent things, and many would be quite useless without them; but too many rules and regulations are disastrous, in that they so restrict the

employé that in an extraordinary case he does not know how to act, and is afraid to adopt a method of his own. Consequently his initiative is destroyed, and the application of common sense to every-day problems becomes through want of practice quite beyond his mental capabilities.

A good chief will always welcome suggestions from any member of his staff, and will not discourage any of his men by telling them they are not paid to think.

Repetition and over-lapping in clerical work should be very carefully avoided. This is not always easy, especially in the consumers' department of a Corporation supply undertaking where all money matters are dealt with by the borough treasurer; but if there are difficulties over the question of the simplification of the rendering and collection of accounts, there is no great difficulty in keeping an excellent record of connections and all matters relating to them without duplicating and repeating everything.

The writer knows of one place where a daily and monthly report gives exactly the same information. Either one or the other is superfluous, but both have to be sent in.

For the proper keeping of records a system of printed forms should invariably be used, but these can and should be kept down to reasonable numbers. There is no need for an average supply undertaking to have forms running into hundreds.

The best system for practical utility is, without doubt, the card index system. For consumers' work there should be three distinct cards. The first card should show particulars of the service, pressure, date connected, and apparatus on circuit. These cards can be arranged in street order. The second card, arranged alphabetically, will enable any consumer to be picked out with ease. This card can well show the meter number and any other metering particulars according to the method employed. The third card must be purely a meter stock card, showing particulars of tests on the meter and its general history, where and when installed, and removed.

To enable the mains engineer to do his work in a quick and efficient manner, he should preserve a careful record on large ordnance maps of every inch of main laid. He should also keep a register of all faults that develop, the causes of them, and the remedies. This record must be properly arranged, so that when a fault develops he can turn up the past history of the section involved, and probably gather from this history a good idea of the cause of the present trouble, and where it is likely to be. This knowledge can largely be carried in the head of the engineer concerned, but it is not system to rely on one's memory, and, after all, the best of memories need refreshing at times.

In the central station the whole working is more or less of a systematic nature, and the records to be kept are in practically every case of a similar kind. Consequently, those strange admixtures of system and chaos which are encountered outside are not so frequent inside.

The standardisation of electricity supply practice is something that the majority of those concerned in the business would welcome, but it can only come through proper organisation. Every engineer must, therefore, realise the value and necessity of system by practising it himself, but he must not allow himself to become "system mad," because it is as bad marksmanship to fire over the target as it is to fall short of it.

The 1886 Co. : Strange Development.—The Moscow Town Governor, N. I. Astroff, has received from the Assistant Minister of Trade and Industry information respecting the conditions on which the Provisional Government is disposed to liquidate the 1886 Co. As is known, the original Town Duma calculated that the shares of the 1886 Co. should pass over to the town at their nominal value, but the Duma afterwards changed its point of view, and found it necessary to state that the price of the shares, in consequence of the new industrial laws, should be reduced by 20 per cent. However, this view of the Town Duma not only was not taken into consideration by the Provisional Government, but it even fixed the price of the shares at 160 roubles. The announcement of the Assistant Minister caused complete confusion in the Council, for the new conditions were so onerous for the town, that even the old Government would not have agreed to them. Therefore, the Town Government has sent specially to Petrograd a member of the Council, L. N. Lyutoschenko, who will submit a report to the Assistant Minister, and supplement it with his personal explanations.

BUSINESS NOTES.

Book Notices.—"Conditions in Germany." London: Boswell Printing and Publishing Co., Ltd. 3d.—Thirty-page pamphlet discussing the accumulating Press and other evidences that inside Germany there is no longer the old unity, confidence, and expectation of success in the war, and that matters appear to be taking the inevitable downward course. The pamphlet is written anonymously.
